Readers who are old enough to have known the miniature magazine, *Les Guêpes*, which M. Alphonse Karr conducted about 1840, will remember a story he related of his own portrait, which embellished one of the numbers. It appears that M. Celestin Nanteuil, the painter, called on M. Karr, and, finding he was out, made himself at home. A stranger came in afterwards, and also sat waiting. The new-comer said his business was to make a portrait sketch of M. Karr. Finding M. Karr was not coming, he made inquiries about the form of the author's face, the colour of his eyes, the length of his moustache, and so on. He begged M. Nanteuil to put himself into M. Karr's dressing-gown, in order that there might at least be accuracy about the costume, and in this way, from mere description, he produced a portrait. In self defence, M. Karr was compelled to submit himself to another artist. The story is recalled to us by the announcement that M. Carolus Duran, the most fashionable of French portrait-painters, has gone to St. Raphael to paint a likeness of M. Karr. The author of "A Tour round my Garden," and the inventor of many charming flowers, is now a venerable patriarch, with a beard that Rembrandt would like to paint. M. Carolus Duran is an admirable painter of ladies' portraits, but will he be successful with the old horticulturist-essayist? Again, what posture will M. Karr assume? One of his wise maxims was "un portrait est toujours le portrait d'un homme qui pose!" The difficulty is to avoid posing with a photographer or a painter. Why does not M. Karr explain how it can be done?

THE OFFICE OF SUPERVISING ARCHITECT.

WE suppose there are few architects practising in the metropolis who were not glad to read in the report of last Friday's meeting of the Metropolitan Board of Works, that the superintending architect had announced his recovery and had asked permission to withdraw his resignation. Mr. Vulliamy was to have retired in September, but, as his successor had not been appointed, he agreed to hold office until the end of the year in order that the Board might have more time for deliberation. Mr. Vulliamy has exercised the functions of his office in an equitable spirit, and there would be satisfaction if he could act as superintending architect for many years to come. But any of his friends who called upon Mr. Vulliamy on Saturday, in order to offer their congratulations to him, could hardly fail to observe that in his desire to be useful he is running a risk to himself. There is no use in concealing the fact that Mr. Vulliamy has not the appearance of a man in vigorous health. His will, intellect, and sense of duty are as strong as ever, but the hard work of his office has affected him to an extent that is not to be overcome by a few weeks' holiday.

We are disposed to believe that Mr. Vulliamy is sacrificing himself in order to enable the Metropolitan Board to tide over a difficulty. It is evident the members have not been able hitherto to agree in the selection of any of the candidates for the office of supervising architect, and it may therefore be assumed that at the commencement of the new session there is a likelihood of a continuance of the inability. Let time be given, and there may be a nearer approach to unanimity. Mr. Vulliamy's self-sacrificing act gives time to the Board.

It is easy to imagine that there are reasons for a division of opinion in Spring Gardens over the question of the appointment. The importance of the Board grows every year, and an officer in the position of superintending architect has work to do which would tax the powers of a Minister. It may be believed by some of the members that for such a position there could be no better training than is given by taking a share in the business of the Board, and from that point of view the most eligible of candidates would be an architect who has had some years of experience in the general assemblies and committees. As every member of the Board has had, moreover, a longer or shorter term of acquaintance with the business of vestries or district boards, he must know many things about the details of municipal administration which are not to be acquired in any other way.

There may also be members who are of opinion that the architectural department should be able to supply a superintending officer. Much is to be said in favour of the adoption of the principle in public offices, according to which, as Shakespeare says, preferment goes by the old gradation, and each second stands heir to the first. In that way able men are willing to accept subordinate positions, and the whole character of the office is elevated. We know that the Metropolitan Board contains admirers of old-fashioned ways, and it is not unreasonable to suppose that some of them would be glad if one of the staff could be elected.

May we not also imagine members asking the question, Is it necessary to appoint an architect to the office? They could argue that the metropolis differs only in size from provincial cities and towns, and that throughout the country the enforcement of the Building Acts is made part of the duties of the local surveyor or engineer. They could say that questions of taste and art are not recognised in any of the clauses of the Metropolitan Acts, and that it would be well if the interpretation of the Acts was literal and prosaic. They could also say that there is less friction between architects and surveyors in country towns than is found in London, where architects act as surveyors. The Metropolitan Board of Works, moreover, possesses an engineering department on a grand scale, and could readily supply an officer competent to deal with every question that might arise under the Building Acts, and much advantage is supposed to be derivable from a closer connection between the Board's departments of engineering and architecture.

If we assume that views of the kind we have suggested are reasonable, and that they have been taken in Spring Gardens, we can see how difficult is unanimity in dealing with the candidates who offered themselves for election. It would be unfair to describe all the candidates, for under the circumstances an architect should hesitate in acknowledging that he sent in an application. But we can say with confidence that among them were gentlemen who, from their experience and honourable career, would do credit to the office of superintending architect. But if the judges were of opinion that a better officer could be obtained in one or other of the ways we have described, what chance was there for an architect who could only refer to his buildings for proofs of his competency and to his clients for proofs of his honesty? It is well known that the Board was dissatisfied with the candidates, taken as a whole, and by doing so a slur has been cast on all who applied. There is some absurdity in the assumption of so high a standard by the Metropolitan Board, but, unless we are mistaken, the true reason was that the judges thought less of the actual candidates than of those which could appear under different conditions.

There was a proposition about issuing a fresh advertisement, in which less restriction would be placed on age, but the obstacle to a selection could not be removed so easily. Even a compromise does not appear to be feasible, and all that can be done is for Mr. Vulliamy to retain his office, no matter at what suffering to himself.

We hope the Metropolitan Board will consider its position, and will not compel Mr. Vulliamy to sacrifice himself. When the Board sought candidates, it must have been able to anticipate their character. It could not be supposed that one of the Royal Academicians or an ex-president of the Institute would enter into the competition. Architects of standing have applied, and they have been rejected without any intimation of the reason. As we have said, a slur has been cast on them which is not easily or quickly removed. If the Board considered that the ordinary practice of architecture was insufficient to enable a man to hold the post of superintending architect, the advertisement should have been held back. It has been the cause of a good deal of anxiety already, and we apprehend that many have injured their reputations by acting upon it. There is no precedent for so sweeping a rejection.

EUGÈNE DELACROIX AND HIS CRITICS.*

EVERY man who can say with Voltaire, "Ma vie est un combat," is also able to say, "My life is a battle-field." Over the reputation of those who have risen above the crowd friends and enemies are certain to fight with as much fury as Trojans and Greeks across the body of the slain Patroclus. And the contest does not end with life. As it has been said that the people are happy who have no history, so it might be added that the only spirits who can sleep peacefully are those whose fame dies with them. The combatants fall into oblivion, but successors arise who go through the same round of contests with the same fate.

There was no artist in the nineteenth century who excited the wrath of more enemies than Eugene Delacroix, and if he did not find an equal number of champions, those who came to his side struck fiercely for his cause. But the battles are already as shadowy as if they took place among Scottish hills in the seventeenth century. Who cares to read the newspaper articles that were written fifty years ago? M. Maurice Tourneux is, however, a gentleman of the Old Mortality species, and, as a duty, he has done his best to save from darkness some record of the fierce struggles in which so many brave men became exhausted.

Four or five hundred writers were engaged for many a day in the struggle which was to decide whether Delacroix was worthy to be placed among the great painters, and, in spite of all the ink which flowed, the issue is not determined. When a general collection of his works was exhibited last year it was evident that men could be found to resume the combat if the public had not been indifferent.

* *Eugène Delacroix devant ses Contemporains.* Par Maurice Tourneux. Paris: J. Rouam. London: Gilbert Wood & Co.

But there were other reputations of more interest at stake, and so the artist was left to repose for a time. His perturbed spirit merited rest. "For thirty years," he exclaimed, "I have been delivered over to the beasts!" and at that time he had ten more years of criticism before him.

It is remarkable that the first critic who had the courage to hail the appearance of the artist was Adolphe Thiers, who in 1822, when the *Dante and Virgil* was exhibited in the Salon, held a humble position in journalism. He seems to have button-holed artists and drew opinions from them. In the case of Delacroix he avowed that the opinion he expressed was that of Baron Gérard, the King's painter. Another critic, M. Delécluze, would hardly accept the work as a picture, although he recognised the immense power that was seen in the figures of the damned who were struggling to enter the boat conveying the poets. A third critic considered the picture to be the work of two men—one designed and drew the figures, while the second was the colourist. The *Dante and Virgil* is now one of the treasures in Sir Richard Wallace's gallery.

It is evident that the picture must have been talked about in Paris; for when, in 1825, Delacroix exhibited his *Massacre of Scio* and other works, he was not so generally ignored. Stendahl said that the artist's works had at least the interest of being much discussed by the public. It is difficult to say what was Thiers's opinion on the new pictures. He was then connected with a second journal, and is supposed to have written the articles on the galleries in the two, although opposite sides were taken. The *Massacre of Scio* showed there was a change in the painter's style. In 1824 some of Constable's landscapes were exhibited in Paris, and Delacroix was fascinated by them. Henceforth his colouring was modified.

When Delacroix worked it was with a sort of fury, as if he were under the sway of a superior power. The exhibition of 1827 contained no less than twelve pictures by him. The titles will suggest how wide was his range. One was the *Death of Sardanapalus*, which remains among his most popular works; then there was the *Christ in the Garden of Olives*, *Marino Faliero*, *Faust in his Study*, *Milton and his Daughters*, *Battle of Turks and Greeks*, *A Wounded Shepherd of the Campagna*, *English Farm Horses*, *A Young Turk caressing his Horse*, *An Indian Girl*, *A Portrait*, *Still Life*. There are not many artists of our generation who could attempt subjects so wide apart in their nature.

The critics appeared to select the *Sardanapalus* as the best work to dissect. There were many of them who tried to be witty in pointing out its defects. Thus one paper stated how Delacroix had hired two furniture vans to remove the furniture that was seen in the background, that three hearses were required for the figures of the dead, and a couple of omnibuses for the living figures. In another it was said that Delacroix was not awarded a prize, but as a compensation he was allowed the privilege of working two hours daily among the corpses in the Morgue. Artists who think they are hardly treated in the journals of our time might learn to be philosophic if they glanced occasionally over the criticisms when a slashing style found favour. The critics who were above appearing witty were no less ingenious in their severity. In one journal the *Sardanapalus* was characterised as the bizarre product of talents that found pleasure in going astray, and it was not surprising to find a few who believed it to be sublime, while the majority were unanimous in saying it was ridiculous.

In 1831 Delacroix again astonished the frequenters of the Salon. That he painted a subject from Byron's "Corsair" may not have been thought strange, for it was supposed that there was some affinity between the spirits of the painter and the poet. But what was to be said to the selection of Burns's "Tam o' Shanter?" On that question we are left in the dark. M. Tourneux does not bring any criticism of the picture into his book, and the most enthusiastic Scotsman would hardly care to overhaul the Paris newspapers of that year in search of an article. We have not succeeded in discovering a notice of the picture in an English journal of that time.

Delacroix was always glad to find a subject in an English author, and it was one of the peculiarities by which he was distinguished from his contemporaries in France. In 1834 he painted the *Hermit of Copmanhurst*, from Scott's "Ivanhoe," but the jury would not accept it. That rejection was at the time a lucky event for the men who were opposed to Delacroix; they were able to say he was extinguished. One time, said the writer in the *Constitutionnel*, M. Delacroix excited lively admiration as well as lively antipathy; to-day the admiration is chilling and the antipathy is indifference. His last pictures seem to be made specially to increase the double lassitude of friends and enemies. But in the next year the same journal was forced to praise the artist, although the jury had rejected the painter's *Hamlet and the Gravedigger*. It is curious to observe how some of the ablest critics became transformed from enemies into champions. In 1833 Théophile Gautier considered that Delacroix was simply a portraitist, and it was a pity he did not keep to that line. Afterwards he helped to spread the painter's fame over the world. In 1836 Alfred de Musset was restrained in his praise, but the conduct of the jury in treating the *Hamlet* as if it were poison did much towards his conversion. Any man or cause that could command two such pens need not fear a regiment of adversaries. Another version of the same scene in "Hamlet" was produced in 1839 and was hung, but it was still beyond the powers of most of the critics to appreciate such a work.

The criticisms on Delacroix are like a game of see-saw. If one writer believes the painter's works are proofs that he was colour-blind and paralysed, somebody else is certain to recognise them as masterpieces of the highest order. The changes may vary, but there are only two tunes. Few of the critics showed more good sense than Alexandre Dumas. The romancist was catholic in his tastes, and found something gratifying in the works of rival schools. When he admired a work he was not afraid to express his satisfaction with the truthfulness of a boy. In the expedition of Delacroix he saw something of his own way. The painter, said Dumas, takes more time in preparing his palette than in painting the picture; once the pencil is in hand nothing arrests him. There is much of the brilliancy of Indian stuff about his colour; the tissue may be less regular, the design less accurate than in French stuff, but put the two together and you will see how the Eastern has killed the other. It is rare to find so much heartiness, and the explanation probably is that Dumas was only an occasional critic. If he kept at that kind of work even his fine temper would be sure to become soured. The man who criticised the *Pieta* of Delacroix in the *Journal des Artistes* may have been before he took up criticism as kindhearted as Uncle Toby or Mr. Pickwick. But seeing many pictures and reading many books made him talk in this strain of the *Pieta*:—"The idea of the work does not belong to M. Delacroix: it is no more than a maladroit compilation. He has stolen the idea from Michel Angelo, he has taken one part from Lebrun's *Magdalen*, another from David's *Femme aux parfums*, and from himself the remainder. We do not say M. Delacroix is a charlatan, but he is the equivalent of a charlatan. He began by parodying the *Shipwreck of the Medusa*, then he played with the Morgue, with the plague, with the cholera-morbus; they are his pastime. His manner is that of a monkey; in that lies his originality." There are artists who fancy that venom and inanity belong solely to English criticism, but M. Tourneux's book reveals that they flourished in France in the palmy days of Romanticism.

Talking of Romanticism, of which Hugo and Delacroix were the great leaders, it must be regretted that the poet and the painter were not more appreciative of one another. There was much in their works that might be described by the same words. But Delacroix, who went so far afield in quest of subjects, ignored Hugo's poems, and on one occasion he declined to sell a picture to the Duke of Orleans because he knew it was to be offered as a gift to the poet. There is in M. Tourneux's book a report of the remarkable conversation between Hugo and Alfred Stevens, the painter, on the qualities of Delacroix. Victor Hugo was willing to admit that the painter was possessed of many endowments, but the sense of beauty was denied to him. He insisted also that Delacroix did not sufficiently recognise the difficulties offered by the materials he employed, and acted as if it were easy to do everything with colour that can be done with words. Hugo

related that on one occasion he asked the painter what a thing was supposed to be, which was held in the hand of one of his figures. Delacroix replied that he had tried to represent the flash of a sword in smiting. According to Hugo, it was only possible to accomplish a feat of that kind in poetry. M. Taine, on the other hand, says that the great quality of Delacroix lay in his power to do feats of that kind, and by painting expressions and effects which are only momentary, he gives us something unattained by the old masters, and which is required for the completion of art.

It might have been anticipated that the International Exhibition of 1855 would determine the rank of Delacroix among modern artists. His thirty-five pictures were enough to impress foreign visitors. But the old story was retold, and the critics were not to be convinced either that Delacroix was one of the greatest artists or one of the most pretentious. M. Maxime du Camp was quite confident that posterity would either allow the painter's works to drop into oblivion, or assign him a rank among inferior painters of the scene-painter class. Other critics who attempted to say smart things against the painter discovered that their writing was suppressed. The Imperial Government did not care much for Delacroix or for any artist who was not a hanger-on of the Court, but there was an objection to articles which might be supposed to bring the exhibition into disrepute. But, on the whole, criticism appeared to be favourable towards the artist.

M. Tourneux might have taken some notice of the criticisms on Delacroix which were printed in English journals and magazines when a picture by the master was seen in the exhibition of 1862. Foreign opinion often anticipates the judgment of posterity, and French readers might be curious to know what the islanders could think about a painter who seemed born to excite contrary opinions. It was not easy to judge of the powers of Delacroix from his single work, *The Murder of the Bishop of Liege*, but the painting was received with better appreciation than it was likely to receive if hung by itself in Paris.

M. Tourneux's book will revive old recollections, but no one will be guided to an estimate of Eugène Delacroix by what was said long ago. The opinion on his works which was written half a century ago in an English publication will serve as well as another for anyone who is not able to trust his own judgment. The writer said :—"He is the envy and terror of almost the whole French school. He indulges in most unjustifiable *tours de force* with cerulean green and brownish purple tints, &c. His drawing is often faulty, but his compositions are masterly and original. He copies from no one, and in his handling and rapidity of painting throws most of his contemporaries into despair. He is not at all understood by the public, but in every atelier in Paris his name is mentioned as an object either of intense admiration or undisguised astonishment." These sentences suggest all that is to be said for and against a painter who deserves to be represented among the foremost artists of France whenever a companion to the *Hemicycle* is attempted.

THE SUCCESSION OF IDEALS.

An address was delivered on Saturday by Mr. W. M. Conway, Roscoe Professor of Art, at the opening of the session of University College, Liverpool. A nation, he said, had its beginning and end, its rise and fall, else would the whole area of the past be full of it, instead of richly peopled in all variety. Each school of thought had beginning and end, else were the wealth of the past nothing and all its products samesome. A field in spring-time was fairer for its many flowers than it would be carpeted by one gigantic corolla ; and just so the variety and multiplicity of the products of the past were its glory, and that variety and multiplicity arose because all things had both beginning and end, because everything included within itself the seeds of decay as well as of growth ; for the world would be cursed by good if it were not blessed with evil. The student of history whose avenue of access to the past was bordered by those existing objects which bygone men moulded into artistic form, could not fail, sooner or later, to adopt this point of view. The past, apart from its effect upon the present, had a real existence for him, and its power to interest and instruct lay in its endless variety. Works of art were the material expression of their makers' delight. Therefore if the ideal and joy of all generations had been the same, art would have been uniform and production might long ago have ceased. But from the beginning up till now men had changed their ideal from age to age by modifying it from moment to moment. The faith of one nation differed from the faith of another. Enthusiastic preaching founded what infidelity at length destroyed. The fetish of the individual was succeeded by the little divinities of the family, the place, or the clan, and they by the nation's God of battle and victory (Ammon, or Asshur, or another), only in their turn to fade away before the great God of all the nations, the World-God of Truth and justice, till in the fulness of time the Universe-God of Mercy and Love should be revealed. Equally various had been the things men hoped for. Moreover, no two nations, whether contemporary or not, were circumstanced alike. Economic conditions changed. Different countries had different climates, and all the factors of civilisation vary from time to time as well as from place to place. Thus, just as no ideal returned to be the goal towards which a second civilisation tended, neither were the conditions ever twice the same which determined the manner of an ideal's enshrinement. Neither again were social and political conditions ever twice the same, and the spiritual and intellectual ideals of a day were always functions of the actual conditions of life. It was with humanity as it was with the individual. No one was the same at any two moments. What a man strived and hoped and even lied and sinned for at one time might be unattractive, might be hateful to him at another. No conception returned unmodified to the mind. The ideals of youth, of middle life and of age, how they differ one from another ! differed as widely as the ideals of different men. So was it with the individual, so too with the nation, so with the race and the sum of the races. There was nothing that was not new under or above the sun. But bygone ideals were often powerful still. That which mankind as a whole or which nations as a whole had at any time striven after, in so far as they had attained it, entered into the sum of human possession and might become the property of the individual ; nay, if it had one produced a moulding effect upon the race, heredity stamped the sign of it on the babe unborn. Whatever part of any ideal was true and good remained for ever a possession of mankind, though it would often be found on examination, and perhaps it must always be the case, that whatever was fundamentally new in it was not true, and whatever fundamentally true was not new. The great value of all ideals lay not in their novelty, but in their harmonising power. It was the possession of a common ideal, unknown though it was to themselves, that made the varied labours of all the men of one civilisation and day mutually helpful, without any definite intention on their part that it should be so. A new ideal was not necessarily, and was perhaps never, a new discovery. It was merely that out of the infinity of possible virtues one took the lead, that amongst the infinity of possible aims one was chiefly sought unto. The value of any ideal depended at any rate, not upon its novelty, but upon the results it produced. That ideal might assuredly be reckoned the most precious which had given the world the noblest lives, and enshrined itself in the noblest forms. And that ideal was assuredly the most base which had produced a race of self-seeking men, and left behind it no lasting memorials of excellent thought to delight and chasten posterity. Between the ideal of self-sacrifice and the ideal of money-making there was indeed a great gulf fixed. Every ideal worthy of the name managed to get itself enshrined in some form that would endure if men only cared to preserve their heritage from the past. What a multitude of glorious possessions we might have, not if our forefathers had devoted more of their energies to making fine things, but if they and we had devoted less to destroying those already made. The mind failed in attempting to grasp some measure of the loss that the world had suffered, not so much from neglect, which was partly excusable, but from wilful and insane destruction. The temple of Karnak, perhaps the grandest building ever raised, might be standing now in almost perfection of repair, if men had not knocked it over to build miserable dwellings for their transient selves, and so with half the other temples of Ancient Egypt. The polished granite casing of many colours was stripped from the Great Pyramid only a few centuries ago. The smile of the Sphinx was shot away by the playful bullets of the cultured French. The Palaces of Assyria were burnt down. The glorious Parthenon existed long enough in tolerable repair to find itself sent to heaven by gunpowder. Some ten thousand marble statues were burnt into lime in the plains of Olympia alone. Almost every one of the thousands of bronze statues which Ancient Greece produced had been melted down into cannon or other mean articles, and, of course, cupidity swiftly disposed of those made of gold and ivory. All the temples and public buildings of Ancient Rome, with a few minor exceptions, were gone. The indescribable glories of Byzantine could hardly be guessed at ; only a disguised Hagia Sophia remained, a mere trifle from the most wondrous city in ancient Christendom. The monuments of the Middle Ages had fared little better. Some buildings they possessed, but how damaged. Shorn of their

colour on wall and window, robbed of their statuary and their furniture. Some paintings, too, but mostly ruined by ignorant and irreverent restoration. The tables of a room would hold all the wonderful remnants of work in the precious metals which had come down to us from Mediæval hands. And one could go on for hours and the half would not be told. All these things had been destroyed, and the world had not been enriched with better, or so good, to take their place. Nor could aught take their place, be it ever so fine, for they were the shrines of bygone ideals, makable when they were made, and then only. He that destroyed a thing that another once laboured to make murdered a dead man. An honest carpenter might continue the influence of his honesty long after death, if the work he had done were respected by those privileged to use it. If they wilfully destroyed it, the good man's influence was at an end. The major part of the usefulness and power of many lay in the endurance of their work, and that endurance chiefly depended upon the piety of the generations that came after. The work of the dishonest cleared itself speedily enough away, thank God. What should they say, then, of the lost plays of Æschylus and Sophocles, of the Zeus of Pheidias, of Lionardo's equestrian statue of Sforza, and all the infinity of glorious works and deeds which had vanished by the destruction or neglect of men? Are they everlastingly consumed, and was their glory a mere shivering of the air? Who should make answer save for the present moment, and in that for anyone but himself? And yet if some transcendent being from another world were to come and say, "The past is not annihilated, but only past," he could not find it in his heart to deny the vision. Let them for a moment adopt that point of view. The poet's eternal landscape, then, was somewhere, only they cannot behold it, their dim sense of memory reaching thither alone, while sight and feeling were constrained into the present moment, which, like a wave across an infinite ocean, brought them all along together. Noble deeds that none ever recorded, or even saw, they were still there, and (who knew?) they might one day behold and rejoice in them. Noble lives, dimly remembered, they were all there complete, and all the noble works of men with them, in that eternal garden of the larger universe. There each bygone ideal still existed, with its expressions about it, and the heroes that it made. Good, indeed, that it had its day "and ceased to be," else could not others have arisen and added to the glory of the sum of things. So they might destroy what they pleased and leave behind whatever wilderness seemed to them good, to be their record in the face of eternity. The noble works of noble men once formed, they might demolish and so make the desert about them more complete; their noble deeds once done they might forget; but works and deeds were beyond their power to annihilate, they had a larger and higher existence there where the hand of man reached no more back to wither and destroy. Dreaming of such existence, and of such only, was it possible to say to any man, or race, or civilisation, or ideal, "*Esto perpetua?*"

THE CUPOLA OF THE CARLISLE TOWN HALL.

A MEETING of the Carlisle Town Council was held last week to consider what steps should be taken about repairing the town clock and heightening the cupola. The Mayor said that as a great part of the old structure of the clock had been burned, and that it would to a certain extent have to be remodelled, it would be expedient, when it was being done, to heighten the bell of the clock so that the sound would travel over a greater distance. There was no doubt the present position of the bell smothered the sound, and it was not heard as well as it might be. Mr. Oliver, the architect, had very kindly sent him a sketch of the proposed heightening of the tower after inspecting the building, which he now submitted. The recommendation of the plan was that it involved a very trivial outlay, and while raising the tower it interfered as little as possible with the present structure.

Mr. Ferguson said he would vote against any proposition for the heightening of the cupola. He could not see any earthly use it could be. He had taken the trouble to see if the cupola was raised 8 feet how far the clock would be visible. They would not see it an inch further up English Street. It was the same way in Castle Street. On the east side—on Scotch Street—they would see it about the length of half-a-dozen shops. If they raised it 20 feet, and he thought that was what they were going to do, it would be seen further, but if it was only to be raised 8 feet they would not benefit anybody by it. They would destroy one of the few parts about the town hall that was in conformity with the old town hall. They had treated the roof of the place more like a stone yard or a plumber's shop than a town hall. They had also put up on the roof something by the Telephone Company, which he did not know what to compare to. Now they were going to take down the cupola, which had been there since the town hall was built. It was in perfect accordance with the architecture of the town hall. The town hall was one very much admired by competent authorities, and they proposed to put on it another incongruous feature. They were going to put upon it an Early English cupola, but the architect had taken great care not to draw the town hall below the cupola, or they would have observed at once the incongruity. There was no advantage to be got by destroying the present cupola, and he trusted that the Town Council would not sanction the proposition and take care that it is not to be touched or meddled with at all, but that it was to remain as it was at present. He moved as an amendment:—"That the recommendation of the Health Committee that the cupola be heightened be not approved, but that the cupola be repaired and kept in its present condition."

The Mayor said it was not proposed to heighten it so much for the benefit of those at a distance from the clock as for that of the people surrounding it. As time went on alterations would be found necessary in the Town Hall. The time would come when they should have to consider the reconstruction of the Town Hall or build a new one. He considered the extension of the sound of the bell an important part of the improvement. He thought the suggestion of the Health Committee was a good one, and he should vote for its adoption.

Mr. Hardy said that if they put up a new Town Hall the work would involve an enormous amount of expense, for it would comprehend all the offices and the arrangements for the carrying on the business of the committees under one roof. That would involve a large expenditure which the ratepayers would not at present endure. The time might come for such a building, but it would hardly be in our generation.

When the vote was taken, the Mayor declared the resolution was lost by 16 votes to 9. The amendment that the cupola be not heightened was then adopted as a substantive motion.

THE ST. GEORGE'S HALL RELIEFS.

A LETTER has been addressed to the Liverpool Corporation by Mr. T. S. Lee, the sculptor, on the recent decision respecting him.

"You will hardly be surprised," he writes, "that I received the notice of termination of my contract with considerable consternation, and as it seriously affects my career as a sculptor it is requisite that I should carefully examine its validity, and it is with very great respect that I must decline to accept it, upon the following grounds:—I am informed, upon the motion of Sir James Picton, it was resolved to complete St. George's Hall by sculpturing certain panels according to the intention of the architect, and for which designs had been prepared, but were unfortunately destroyed. A competition for this purpose was advertised, with a premium of 200*l.*, in which I was fortunate enough to be successful, and the designs for three panels were approved by the Council. These designs were separate and isolated, and were after consideration, at my suggestion and the approval of the Council, varied so as to form a series. A provisional contract was entered into for the completion of the first as an example, upon the conditions that if the work was not proceeded with 500*l.* should be paid; but if, on the contrary, it was satisfactory, and the Council determined to continue the work, it should be remunerated at 450*l.* for each of the whole series. The first panel was completed, placed in position, and approved. The Council then determined to go on with the series. The design for the second was approved, and the Council directed a second contract to be drawn up, which was accordingly done and was approved by the Council in the form which it now stands. This contract, amongst other portions, stipulates that the said Thomas Stirling Lee shall execute in bas-relief a sculpture for each of the said panels for the sum of 450*l.* for each panel. No. 3 provides that any design beyond those already approved shall be submitted to the Corporation or any committee appointed by them, who shall have power to approve or reject. No. 5 provides that at certain periods, namely, after the fixing of any sculpture in any panel, the Corporation for the time being may terminate the contract. This stipulation, as the Council will see, is one-sided. It gives the Council power at certain periods to terminate the contract, but leaves me no such power. I, however, consented, as it was pointed out to me that, as I was a comparatively young and unknown artist, the Corporation might naturally be anxious not to lay themselves open to the possibility of my forcing upon them careless and incomplete work, whilst I might rely upon such an important Corporation not to infringe upon the spirit of the contract, nor to put an end to it unless it had sound reasons to be dissatisfied with the work. The first panel and design for the second having been approved before the signing of the contract, I maintain that the only question before the Council on August 4

was the model so far complete in accordance with the original design as to fulfil my part of the contract? This was established by one of its members appointed for that purpose. There was no further fact before the Council since the contract was signed, nor, according to my contention, could the Council terminate the contract, until by the contract the second panel was fixed. Upon this it was moved by Mr. Alderman Samuelson, seconded by Mr. Rathbone, that the Council be recommended to arrange for the withdrawal of the notice to determine the contract with Mr. Stirling Lee, and for this purpose to rescind the resolution passed on August 4, 1886, and that the matter be reconsidered when the second panel has been fixed. It was moved as an amendment by Mr. Muspratt, seconded by Mr. Thomas Hughes, 'That the town clerk arrange for the payment, without prejudice, to Mr. Stirling Lee in full discharge of all claims under the contract of the balance which would be due for the two panels if calculated on the basis of 500*l.* each.' On a division there appeared for the amendment four—Mr. Holder, Mr. T. Hughes, Mr. Muspratt, and Mr. Royden, M.P.; against it four—Mr. Bower, Mr. Samuelson, Mr. Yates, and the chairman; and there being an equality of votes, the chairman gave his casting vote against the amendment, and the same was accordingly negatived. It was moved then, as a further amendment, by Mr. Yates, that the contract with Mr. Stirling Lee having been terminated, the town clerk be authorised to arrange, without prejudice, for the payment of the sum of 250*l.* in final settlement of all Mr. Lee's claims in the matter. On a division there appeared for the further amendment, five, against it, three; majority for the further amendment two; and the further amendment having been carried and put as a substantive motion was adopted."

THE LINCOLN SCHOOLS OF SCIENCE AND ART.

THE new building in Monk's Road, Lincoln, for the Schools of Science and Art was formally opened last week by the mayor.

An address on art was delivered on the occasion by Mr. A. G. Webster, who said:—Of all the questions which are raised by the future of public instruction, no one surpasses in importance the teaching of drawing. In Germany, France, Italy, every day fresh and greater sacrifices are imposed by the people on themselves in order to endow the rising generation with this most powerful instrument of the workman. To the economist it represents one of the most essential elements of victory in the struggle for existence; to the teacher it offers the most striking example of the simultaneous culture of the senses and the reasoning faculty. Drawing assists, at one and the same time, the education of the hand, the eye, and the intellect; at once material and intellectual, it is destined to play a great and leading part in that reasonable system of education which the future will give us. It belongs, without doubt, to that broad elementary groundwork of instruction, in regard to which all our children have equal aptitudes and equal rights, and in which it would have found a place long since if, by a singular wrong-headedness, it had not been regarded as a superfluity (or the attribute of a few heaven-sent geniuses), instead of being, as it is really, indispensable to all workmen who aspire to anything beyond mere hewers of wood and drawers of water, and easy of acquirement to children. Some superfine people say, "To what purpose is it that you are vulgarising the fine arts; are we not overrun by a horde of third-rate artists?" Just as truly might they rail against the teaching of writing, as adding to that shoal of authors who now afflict the land. The error consists in thinking that drawing is taught on purpose to produce painters, sculptors, and architects; one becomes no more an artist by representing the appearance (more or less) of an object with pencil or brush than the faculty of using intelligible phrases denotes a Shakespeare. Drawing bears exactly the same relation to art that grammar does to literature. I do not desire to see our elementary schools turned into manufactories of artists; but what I do say is, permit every child to learn to read and write "things," as they learn to read and write the names of those things. The time devoted to this so necessary study has hitherto been ludicrously insufficient, as a rule an hour a week. I believe that in all elementary and grammar schools the time should be divided somewhat in this way:—Three hours to books, one hour to drawing, and one or two to work with tools; this general course to last two or three years (when the aptitudes of a boy would be discovered, and he could follow a special direction). A skilled workman should be on the regular staff of teachers, and superintend the instruction in sawing, planing, turning, &c. The man that is to follow any kind of handicraft, making spades or shoes, waggons or hats, chairs or houses, is a better man from having his hand and eye trained in learning to draw. The commercial value of almost everything that is made is affected more or less by its artistic form; the commonest utensil is more desirable if it is shapely and symmetrical. Even those who are to follow mercantile or professional callings are finding use continually for this power of writing forms, and are often greatly disabled from lack of it. Who is there that does not often need the power of making an intelligible representation with the pencil of something he wishes to have constructed or to describe? The idea that drawing is a mere accomplishment can be entertained by none but the ignorant; nothing is taught the utility of which is more obvious. The notion as to the instruction of children I just mentioned is no chimera; it is now in full work in several towns in America, where it is found that the pupils, although giving only about half the time to books that those in the ordinary schools do, progress just as rapidly in all branches, and in addition learn two of the most essential attributes of men, to use their hands and eyes, the functions of which useful members, through the excessive devotion to mere book education, are in danger of being seriously impaired. If our present system is not modified, when we want a nail knocked in we shall have to send to Germany for some one to do it. I speak somewhat bitterly, from my own experience at school, leaving there with a smattering of two noble languages, pronounced in a way to make the ancients turn in their grave, and what else? I wonder they don't teach children to pronounce German and French with the English values of the letters. In this beautiful building that the liberality of our townsmen has provided I hope that we shall not only successfully teach drawing in its industrial phase, but also gather a circle of earnest students of the beautiful. Some are already far advanced, and now we have a fitting home I hope they may find it to their interest and convenience to work here, for the honour and glory of our city, and as a protest against that great evil of centralisation which is sapping the life of the country to satisfy the insatiable maw of London. All great art has been the out-growth and representation of the life of the time of the artist—Egyptian, Greek, Roman, Mediæval, Renaissance, modern French and English—all else is a mere exotic and plaything. Certainly the great Italians painted scriptural subjects, but the figures are Italian and in Italian dress, and quite right, for the great facts of humanity are external, the rest matters little. The great artists have been frankly in touch with their own times. A picture of an Italian or Spanish subject is, when painted by an Englishman, but the very outside, the husk. He that has eyes to see will find that all round and every day we live in the midst of beauty, more subtle than the picturesqueness of red and yellow pocket-handkerchiefs. That is not to say that one may not study and paint abroad for a time. Indeed, when a man is an advanced student, there is no possibility of his learning to know how little he does know and to remedy his faults except in Paris. But the work by which a man will be remembered after his death must be the presentment of himself. The greatest writing is, to a great extent, autobiographical, and a man is of his own country, and his own town even; one regrets the old municipal life, each town complete in itself; perhaps those days may return. I hope to make a very special feature of modelling. Indeed, I should like every student in the school to have some acquaintance with it, besides teaching it specially to all who are carvers in any material. I should like to see every boy intended for an architect go through a two years' course of study in the School of Art before entering an architect's office. In France, Germany, and Austria no man can call himself an architect until he has gone through a seven years' course, quite three years of which are devoted to School of Art studies. I am sure that a student could prepare himself for the diploma examination of the Royal Institute of Architects very advantageously in our school. I hope also to get together a class in wood-carving. But, to end as I commenced, drawing, without that nothing. People want a royal road to learn dodges and tricks, to make their friends think they can do something, but without drawing all is vanity and Dead Sea apples, sometimes deceptive for a time, but invariably found out at last.

THE GLASGOW INSTITUTE OF MEASURERS.

THE annual meeting of this Institute was held in the Christian Institute on Monday. In the report of the Council submitted to the meeting it was stated that the membership was forty-four. It was also reported that rules and regulations for the measurement of wright, glazier, and plaster works had been drafted, and were about to be submitted to joint committees of the several parties interested. The following gentlemen form the Council for the ensuing year:—President, David Robertson, 205 Hope Street; vice-president, John Densken, 121 West Regent Street; Council, James Howatt, John Shields, Robert Scott, Michael Cunningham, John Morrison, D. S. Wilkie, William Howatt, R. G. Stirling, Robert Reid, and J. H. Ramsay. Auditors, Robert Scott and R. G. Stirling. Secretary and treasurer, William Howatt, 146 Buchanan Street.

DIDEROT AND HIS FRIENDS.

THE limitations of the art of M. Meissonier have been often descanted upon by critics in all tongues. But there is no modern painter whose work is less likely to be thought antiquated hereafter. When a general exhibition of the artist's works was held in Paris a few years ago, it was a common remark that his earliest pictures have not only preserved their colour, but are as interesting as when they were painted. In subjects like the one we illustrate this week M. Meissonier is at his best. Although he often paints figures in fierce action, such as those in *The Rixe* (which was a birthday present to Her Majesty from the late Prince Consort), yet it is plain that he has a preference for figures in repose. It is also customary for the artist to surround his figures with details that are suggestive of comfort. His *Diderot* is an example. The great writer is here seen surrounded by his friends the encyclopædists, who were co-operating with him in producing the literary revolution of the eighteenth century. What is the work that engrosses the attention? It may be one of Diderot's splendid pieces of criticism, or more likely one of his short stories which are among the classics of the French language.

The etching is also suggestive of the variety of work that is reproduced in *L'Art*.

THE CONSTITUTIONAL CLUB, NORTHUMBERLAND AVENUE.

ON the site of the gardens of old Suffolk House the Constitutional Club has just been completed from the designs of Mr. Robert W. Edis, F.S.A., architect, of Fitzroy Square, and was opened on Monday for the reception of its members.

The new club house differs materially in design and general colour from the gigantic hotels which fill up the greater portion of the avenue. The general treatment of its details with well-modelled ornament, and the warm colouring of the terra-cotta work, with which it is entirely faced, give a play of colour and light and shade rarely found in London street architecture. The style of the building may be called a free rendering of German Renaissance.

The site being wedge-shaped—with its narrow end looking towards the river, having over 200 feet frontage in Northumberland Avenue, and about the same in Northumberland Street, with an extreme width at its widest end, next the Grand Hotel, of about 110 feet—presented much difficulty in the arrangement of the various rooms, and the general planning of the interior. The architect has emphasised the narrow end of the wedge by a circular end with open arched loggia on the first floor and circular turret, thus forming a picturesque termination to the high-pitched roof of the main building.

All the principal rooms are grouped round an octagonal centre hall, which forms an important feature on the ground plan. The main entrance is placed at the northern or wider end of the site, and, in addition, separate entrances are provided for access to the members' bedrooms or chambers above the principal floors, and for tradesmen, in Northumberland Street.

The basement and mezzanine floor over are devoted to the general service-rooms of the club, and contain a kitchen, 50 feet by 30 feet, with all the necessary offices, servants' hall, 46 feet by 21 feet, stillrooms, steward's-rooms, cellars, and boiler and engine rooms for the electric lighting and steam pumps. The ground floor is occupied with a lofty entrance-hall and vestibule, 43 feet by 20 feet, with reception-room, 27 feet by 25 feet, leading from the latter, for use of friends of members.

The large octagonal inner hall, which, together with the outer hall, is lined with delicate white-toned marbles (pavonazzo and veined), is 30 feet in diameter, and off this are the morning-room, 120 feet by 30 feet, with central recessed portion with circular bays, 50 feet by 26 feet; smoking-room, 45 feet by 26 feet, and lavatories, &c., with bath and dressing-rooms on mezzanine.

The service rooms on each floor are arranged in the centre of the building, with hydraulic lifts from kitchen, stillroom, and wine cellar opening into them. These rooms are arranged on each floor so as to communicate direct with all the principal rooms of the club.

On the first floor, which is approached by a well-lighted broad marble staircase, 10 feet 6 inches wide, with balustrade of rich pavonazzo or purple-violet marble, is the general coffee-room, 140 feet long by 30 feet wide, with central portion recessed with circular bays, giving an extreme width at this portion of the room of 52 feet, and finished at the narrow end with an open circular loggia, or large balcony, facing the river; a library, 51 feet by 27 feet, with librarian's room, and separate staircase, and billiard room, 45 feet by 26 feet 6 inches, together with service room, lavatories, &c. The rooms on ground and first floors are 20 feet high, and on the second floor 16 feet.

The second floor is devoted to large general smoking room, 100 feet long by 31 feet wide; billiard-room, 50 feet by 28 feet; card-room, 32 feet by 22 feet; committee and house dining-room, 46 feet by 24 feet; lavatories, service room, and secretarial rooms.

In the third, fourth, and fifth floors are arranged about 80 bedrooms for the use of members, with separate staircases, bathrooms, &c., and accommodation is also provided on these floors, and on the various mezzanine floors facing Northumberland Street for about sixty servants.

The building generally is of fireproof construction throughout, and is provided with every modern convenience, including hydraulic lifts for service and luggage, and an hydraulic elevator to each floor for the use of members. The principal portions of the rooms will be lighted by a novel system of electric lighting, specially designed by the architect, the lamps forming part of the ornamental ceilings, the usual fittings in the shape of hanging electroliers being altogether done away with. Each floor is fitted with high-pressure water mains, and the whole of the rooms throughout are thoroughly ventilated by a system of exhaust tubes fitted at the top of the building, with one of Blackman's air propellers, worked by steam-power from the basement.

The whole of the internal fittings, including the richly decorative plaster ceilings, stoves, and mantels, have been specially designed by Mr. Edis, and the modelling of the whole of the exterior ornamental work has been executed in terra-cotta from models prepared from his designs and under his supervision by Mr. George Frampton, a young sculptor, who has gained various medals in the Royal Academy School.

Mr. Edis is well known as an advocate for the use of terra-cotta in London buildings, as being more suitable to withstand the deleterious atmospheric influences than any ordinary kind of stone, and with the sanction of the Board of Works, has used it entirely in two colours—red and buff, for the facing of this building; and this work has been excellently carried out by Mr. Edwards, of Ruabon, whose terra-cotta is well known for its general hardness, the whole of the work being self-coloured.

The whole of the general works have been carried out from the designs and under the supervision of Mr. Robert W. Edis, the architect, by Mr. Boyce, builder, of Eagle Works, Hackney; the marble work by Messrs. Burke & Co., of Newman Street; the heating, ventilation, and kitchen fittings, hydraulic lifts and mains, and boiler work by Messrs. Benham & Sons, of Wigmore Street; the ornamental plaster ceilings, &c., by Messrs. Jackson & Sons, of Rathbone Place; the electric lighting by Messrs. Verity & Sons, of Covent Garden; the mantels and stoves, &c., for the principal rooms by Messrs. Yates, Haywood & Co. and Messrs. Longden & Co.; and the sanitary fittings and plumbers' work by Messrs. Matthew Hall & Co.; Mr. Holloway acting as the architect's clerk of works, with Mr. Wilkie Edis as assistant. The gasfittings and electric bells and speaking tubes are by Messrs. Strode & Co.

The building has been furnished by Messrs. Maple & Co. and Messrs. Shoolbred & Co., of Tottenham Court Road, the latter firm supplying the carpets, blinds, &c.

It may be mentioned that the club already consists of 5,300 members, of whom 1,500 are town and the remainder country members, with a waiting list of about 1,200 candidates; and that the whole of the works have been well and satisfactorily executed at a cost much within the contract amounts.

ARCHITECTURAL ILLUSTRATION SOCIETY.

NO. 28.—SAIGHTEN GRANGE, CHESHIRE, BEFORE RESTORATION.

GLASGOW ARCHITECTURAL ASSOCIATION.

THE first of this session's series of lectures was delivered last week by Mr. William Shireffs, his subject being "Electric Deposit of Copper as applied to Decoration." Mr. William H. M'Nab, president, occupied the chair. The paper was divided under two heads—historical, and practically descriptive. Explanatory of the latter a large selection of examples was exhibited—figure panels, friezes, pilasters, &c., and a working demonstration of the process as carried out by himself was given by means of a single cell battery, from which a fine impression of a medallion was taken, obtained after an immersion of some five hours. At the close Mr. Shireffs was awarded a vote of thanks.

THE STONEWORK OF MALTA.

THE exhibits in the Malta court of the exhibition at South Kensington having excited some interest, the acting commissioner has published some information on the subject.

I am daily invited, he says, by private proprietors, architects, builders, and others to give an opinion which may be depended and acted upon here on the subject of "the constitution of its stone," its adaptability for building purposes in this country, its powers to resist frost and snow and the severities of an English winter, which, I need not say, finds no parallel in Malta.

Although there is a hard stone as well as a soft stone in Malta, the principal specimens of stonework shown in the Malta court are of soft stone. I instance the pretty façade facing the court, which is constructed in soft stone, the design of which, copied from a gate at Heidelberg (period of the German Renaissance), was sent to Malta, executed there, sent in boxes to this country (which now form the rockwork behind it), and reconstructed here. There are also some very elaborately ornamented fountains and vases, which, from the delicacy and intricacy of the work, are better placed in conservatories in this country, while outside the court, under a shed running parallel with the court, are specimens of balustrades of various kinds and patterns, which are attracting general observation on the part of private proprietors, architects, and builders, owing to their extraordinary cheapness compared with works of a similar character when executed in this country, together with the variety, originality, and beauty of the designs.

Though every class and description of ornamental stonework can be well imported into this country at a much lower rate than can possibly be executed here, from a façade to a balustrade, it is with special reference to these latter, which have engaged the particular attention of the public, with their cheap stone run above and at their base, that I am daily asked:—1. What will be the expense (over and above the prices marked on each as manufactured in Malta) of bringing from Malta and landing in the London docks the balustrades and cornices in question? 2. When they are brought here and used for ornamental building purposes, will they be enabled to resist the severities of an English winter.

Before, then, anything can be done to stimulate a future trade in this class of work between Malta and this country, both these queries, and especially so the last, must be satisfactorily replied to. In answer to the first, I have been informed by experts in Malta that an addition of 60 per cent. is sufficient to cover all cost of freight and transport delivered in the London docks; but, to be quite on the safe side, I should prefer to quote 80 per cent., and even then, with that addition, at the price these balustrades are manufactured in Malta and marked in the court and catalogue—from 6*d*., 7*d*., 1*s*., 1*s*. 9*d*., and in proportionate increase up to 4*s*., with their cornices at 6*d*., 10*d*., and 1*s*. the foot run—they would be, after all expenses paid, incomparably cheaper than any that could be possibly obtained in this country, where both material and wages for skilled labour are so very much in excess of the cost of either in Malta. But of far greater importance than the question of cost of freight and transport is that of the durability of the Malta ornamental stonework; for if, when imported here, it would be found to yield to the severity of the climate, it would be altogether useless to import it. This is the question which, left unreplied to, staggers all would-be purchasers, and it is to its power of endurance when imported here that I have always hitherto hesitated to give a confident reply from want of experience. Now I feel, owing to the kindness of Earl De la Warr, I am in a position to speak with that experience which was wanting previously. While visiting at Buckhurst a short time since, I ascertained that there were no less than sixteen Malta stone vases of various sizes, varying from 4½ feet in height, with a breadth of 2 feet, to 3 feet high with proportionate width, which have been left exposed to the open air during winter and summer for the last fifty years. These vases, which were made in Malta after the designs of Mr. Repton, architect, were on completion sent to this country, and, with the exception of only one out of the sixteen, which was damaged by wet earth having been carelessly put inside it for the purpose of flower-planting during a sharp frost, and was slightly cracked in consequence, are all of them in the most perfect state of preservation, and after half a century's exposure show no damage whatever, and are not more discoloured than would be the case with any specimens of our English stone made subject to the same test of years and exposure. I would specially point out, however, that in the case of no one of these vases is any of the ornamental work on the vases stuck on; all the ornamental designs, vine-leaves, grapes, &c., are cut out in relief from the solid stone, and to their solidity in this respect I attribute to a great degree their permanence after a trial of half a century's duration.

I trust that this clearing up of the difficulties which have hitherto prevented many purchasers from investing in Malta ornamental stonework—viz., those of its endurance of the severities of an English winter—together with the much lower comparative cost of this class of work, whether for garden or house ornamentation (for in Malta the pretty and effective balustrade ornaments are used in the most modest and humble dwellings of the poorer classes), than can possibly be obtained here, will induce private proprietors, architects, and others to invest largely in this ornamental stonework. And if I find that applications will be made to me at the Malta court with a view of dealing to some large extent in this ornamental work, which will greatly benefit one of the chief native industries of the island, while, on the other hand, it would give the architect and builder in this country ornamental material to work with, which he could under no other circumstances obtain at a similar cost, I should under such circumstances communicate with the Government of Malta, that in the first instance, and until the trade was in such good working order that it could stand on its own footing, all orders of importance for works of this class received here should be sent through the Government, when its first-class execution at fair prices will be secured.

THE MASTER OF WORKS OFFICE, GLASGOW.

IT will be remembered that allegations were made a few months ago in the Glasgow Town Council about irregularities in the letting of municipal contracts and the superintendence of works. It was, in consequence, resolved to make an inquiry into the organisation of the Master of Works Office, and a committee, consisting of the Lord Provost and some of the bailies and councillors, were appointed for that purpose. The report has been completed, and is of voluminous extent.

After describing the procedure of the committee at great length, the report states how the committee resolved to ascertain whether the complaints which have been made against the department and certain members of the staff could be substantiated. They accordingly instructed the town clerk to request four gentlemen who were understood to have expressed dissatisfaction with the manner in which the department had been conducted to meet them. To this invitation one, a contractor, returned no reply; another, a member of the Town Council, wrote that he had not expressed dissatisfaction with any of the officials in the department, but had said that he thought the organisation of the office capable of great improvement. Another, an architect in business in Glasgow, wrote stating that he had expressed dissatisfaction in two respects, namely:—(1) On the ground of plans for the Dean of Guild Court being prepared by *employés* in the department, and (2) on the ground of the Master of Works department being employed to carry out works of considerable importance, which he considered highly detrimental to the public interest, as being both extravagant and liable to foster abuses, and that if architects in independent practice were employed the work would be better and less expensively done. Another of the gentlemen, a member of the Town Council, appeared before the committee and referred to matters relating to contracts connected with the Corporation and police departments since 1881, and stated that the subjects he alluded to would be found recorded in the minutes. The committee thereafter met with the two architect assistants in the office referred to in the architect's letter, and heard them as to plans prepared by them for private parties. From their statements, which the committee felt were fully and fairly given, they are satisfied that such work has been done only to a very limited extent.

On June 8 the committee remitted to a sub-committee consisting of the Lord Provost and Councillor Osborne, to meet with any parties who might have any evidence to adduce affecting the administration of the Master of Works department. The sub-committee caused a communication to be sent to the contractor before referred to, who had not acknowledged the committee's previous invitation asking him to meet them. In reply to that letter a letter was received which the sub-committee considered satisfactory. They accordingly directed another

communication to be sent to him, asking specifically whether certain statements had been made to him in connection with a tender he had sent in by one of the officials of the Master of Works department, and also whether he had ever said to any one that such a statement had been made. No notice has been taken of this communication. At the meeting of the sub-committee above referred to, a gentleman attended who stated that he had been engaged in building operations on his own account in Glasgow for twenty-nine years, and had during that time had experience of the Master of Works department; that he had invariably found the officials there civil and obliging, and willing to give him assistance in every way. He had no complaint to make against them. He had never been asked by any of them for any sum of money, nor had it ever been hinted to him by any of them that such a thing would be acceptable.

The committee had another meeting on June 24, when they met with Mr. Whyte and heard his explanation as to the complaint understood to have been made by the contractor previously referred to, and also as to the circumstances under which certain of the works at Shieldhall and the Cattle Market had been altered from those specified in the specifications. In the course of the interview the committee asked Mr. Whyte, "Have you ever derived any personal advantage from any changes made by your authority on specifications?" To which he replied, "Never, and I never received one penny from any contractor who has done any work for the Corporation or any of the municipal departments; nor have I ever, since I was connected with the Dean of Guild Court, received any consideration from anyone in connection with any plans submitted to that Court." Mr. Whyte was then asked, "Have you ever been offered money by any party for any services rendered by you connected with the Dean of Guild Court?" To which he replied, "I have frequently, but I always refused it." Mr. Whyte also stated to the committee that from the alterations which he had made on the specification for the roofing of the Cattle Market, he expected there would be a saving of about 3,000*l.*, and also that there should be a considerable saving to the local authority from the alterations on the Shieldhall contract. He further stated that the alterations were made by him with the sole view of effecting a saving.

From the above it will be seen that the committee have availed themselves of the means at their disposal for endeavouring to ascertain whether the charges previously referred to could be substantiated, and they feel justified in saying they consider nothing has been laid before them to substantiate them. Further, while it is true that Mr. Whyte has erred in allowing departures from specifications to take place without obtaining the consent of the body for whom the work was being done, yet, when that has been said, there is nothing more, and the committee believe that he has allowed these departures, believing them to be in the interest of the public and not with a view to personal advantage, and that in fact he has not derived any personal advantage from them.

As regards the second ground of complaint stated by "Architect" in his letter, all the committee consider it necessary to say is that it has evidently been written in ignorance, and that the experience which the Corporation have had leads to conclusions quite opposed to those on which he grounds his complaint.

In reference to the Belvidere contracts the special committee appointed by the Police Authorities met on July 9 last, and having duly considered the remits to them and relative minutes and documents bearing on the subject, were of opinion that it was unnecessary that the reference to the President of Glasgow Architects regarding the matter specified in Mr. Ramsay's report, proposed in Bailie Shearer's amendment of March 9 last, should be proceeded with; but in respect the matter had been publicly and prominently discussed, they directed the clerk to communicate with the contractor (Mr. Lightbody) with a view to steps being adopted to refer the matter to the President of the Institute of Architects, as proposed in Bailie Shearer's amendment.

The clerk having written accordingly, on July 22, the following reply was received from Mr. Lightbody:—

July 27, 1886.

Sir,—I have your favour of the 22nd inst., with copy of Mr. G. A. Ramsay's report on work done by me in 1875, 1879, 1880, 1881, 1882, and 1884 for the Committee of the Police Board of Glasgow.

As your committee is aware, no complaints were ever made to me about the work, nor was I consulted as to the appointment of Mr. Ramsay, nor afforded an opportunity of giving explanations or being heard on the matters reported on by him.

While it appears to me an outrage on common sense, and a subversion of all rules of trade and business, to propose to open up contracts completed and paid for so many years ago, and which contracts were so completed under the supervision and direction of the committee and its architects, inspectors, and measurers; still, if the request to do so be made, not as a matter of right but as a favour, I have no objections, on condition, however, that a formal reference be made to the gentleman mentioned by you, and that the particular questions on which your committee wish his judgment be articulately stated, and that your committee pay all the expenses of the reference, including my own expenses for time and outlay, my law agent's account, and the expenses of all witnesses I may require to produce for examination before the arbiter.

I need not, at this stage, refer particularly to the matters mentioned by Mr. Ramsay, but his report includes some work not executed by me.—Yours, &c. William Lightbody.

The committee again considered the whole subject, made additional inquiry, and had an interview with Mr. Hannah—who has acted as clerk of works and inspector at Belvidere during the whole time the buildings erected there have been in progress—who explained to the committee the rules which guided him in the passing of work and material, and in the general discharge of his duty, and also described the circumstances connected with the several matters dealt with by Mr. Ramsay in his reports. Mr. Hannah stated also, in the most positive manner, and in reply to direct questions, that he has never at any time received money or any other consideration whatever from contractors or in connection with the execution of work for the city, and that the whole work done at Belvidere is good, sound, tradesmanlike work, and conforms fully to the spirit of the specifications.

The committee having heard the statement of Mr. Hannah and all other available evidence bearing upon his conduct, and the manner in which his duty has been discharged, are of opinion that in two or three minor matters he had erred in judgment in not adhering more rigidly to the letter of the specifications, but that no serious blame can be attributed to him in respect of these. The committee are satisfied that Mr. Hannah has for this long period of years served the Police Board honestly, conscientiously, and with much practical ability, and no evidence whatever has been forthcoming to confirm a charge either of dishonesty or culpable neglect or of want of fitness for his duty. The committee are, therefore, of opinion and report, that Mr. Hannah is entitled to be acknowledged as a faithful and capable public servant.

As regards the proposed reference, the committee deem it unnecessary under the circumstances, and recommend that no further steps be taken in the matter.

With reference to the future organisation of the office, the committee recommend that, under the supervision and direction of Mr. Carrick, the office should be divided into the following departments, for the due conduct of the business of each of which an assistant under him should be responsible:—

1. The Statute Labour, Paving, and Dean of Guild Court work, including the supervision and carrying out of all the provisions in local and public Acts as to streets, sewers, drains, and buildings within the city, to be under Mr. John Whyte.

2. The engineering and surveying work to be under Mr. A. B. M'Donald, C.E.

3. The architectural work of the office, including the supervision of the clerks of works in connection therewith, to be under Mr. David Macbean.

The committee recommend that all the officials in the department be prohibited from doing work for private parties.

The committee further recommend that the salary of Mr. David Macbean be increased from 125*l.* to 150*l.*, and the salary of Mr. Wyllie, also of the Architectural Department, from 80*l.* to 120*l.* The committee are of opinion that the salaries of other officials in the office should also be increased, and recommend that it be remitted to the Statute Labour Committee to consider and report to the police authorities as to what increases should be granted.

That in the matter of contracts the present practice of tenders being issued from and returned to the Master of Works department should be altered in so far that the tenders should be returned in future to the Town Clerk or Clerk of Police, whose duty it will be to hand them to the committee—the City Chamberlain or Treasurer being the custodier of the contracts after their acceptance by the committee.

That all accounts in connection with the expenditure for the various departments coming under cognisance of the Master of Works office shall be under the charge of the chief clerk, who shall see to all such being duly certified by the parties in charge of the work, and, after the same have been certified by the Master of Works, or his assistant, shall be handed to the City chamberlain or the treasurer of police for his further scrutiny and examination.

The following are the principal portions of Mr. Carrick's statement:—

As requested by the committee, I now beg to submit the following information for their consideration, in dealing with the future arrangements of the office. The total number of persons employed, exclusive of Mr. Whyte and myself, is thirty-four; of these, twenty-one form what may be termed the indoor staff, the remaining thirteen being engaged in outside duties. The total amount of salaries payable to the indoor

staff is 2,365*l.* The outdoor staff is composed wholly of skilled practical tradesmen of experience in connection with streets and structural arrangements of the city, the number engaged being thirteen. The total amount of salaries payable to this staff is 1,582*l.* 10*s.*

After detailing the duties of the staff, Mr. Carrick proceeds :—I have endeavoured thus briefly to give the committee an idea of the duties of the staff which, partly under my own direction, and that of my assistant, Mr. Whyte, comprises the department of the Master of Works ; and I embrace the opportunity of expressing my satisfaction with the discharge of their several duties, and confidence in their rectitude. At the last meeting of the committee the question was raised as to the various employés engaged in private professional work, to which strong objections were urged, both on the grounds of expediency and the rumour of its leading to favouritism in the passing of plans through the Dean of Guild Court. It is perfectly true that some of them do private work, but only in their own time, and this they claim as a right, having the implied consent of the town council. As regards the statement that such professional work leads to partiality in the Dean of Guild Court, I can give this my most unqualified contradiction. Plans prepared in the Master of Works office for all the various buildings erected by the town council are subject to a more rigid scrutiny than any others presented to the Court, and it is not likely that the Court would be guilty of any such dereliction of duty, as is insinuated by those who have made such gross imputations, by surreptitiously passing plans prepared by any subordinate in the office. It is for the committee, however, to deal with this question of private work, which I know some of the members of the staff feel compelled to undertake to enable them to support themselves and their families. I have no doubt that the general impression that private work is carried on to an undue extent had its influence in the various applications for increase of salary being rejected. Hitherto Mr. Whyte has undertaken, I may say, the sole oversight of the outdoor department, not only as regards the duties under the Police Act, embracing the Statute Labour Department and Dean of Guild Court business, but also as regards the erection of structures such as the hospitals, baths, and washing-houses, and the extensive works in connection with the Market Trust and Local Authority. The work in connection with these buildings, &c., devolved on Mr. Whyte in some manner owing to my bad health, and during my temporary absences on Parliamentary business, and gradually the conveners of committees took advantage of his services, absorbing a large portion of his time. It has been cause of great pain to me to find that recent circumstances have raised suspicions against Mr. Whyte ; I believe these to have arisen owing to rumours as to Mr. Whyte's accumulation of great wealth, which he could only have realised by dishonest complicity with contractors. I know that such rumours are unfounded. Mr. Whyte's means are not more than could be expected from the thrift and economy which has distinguished him during his long service under myself.

With reference to the future management of the office I would suggest :—1. That the discharge of duties of the engineering, surveying, and architectural departments, including the clerks of works employed at the buildings in course of erection, shall be under my own immediate supervision, or that, in my absence, of my assistant, Mr. M'Donald. The clerks of works to report every morning to the department the progress of the various contracts and the character of the works, and it shall be their duty to see carried out all instructions which may be issued from time to time by the various committees, or myself as their architect. 2. That the duties of Mr. Whyte, as my assistant, shall be restricted to those defined in the Police Act, embracing as these do the Departments of Statute Labour and Paving, the supervision and carrying out of all the provisions as to streets, sewers, drains, and buildings situated within the city, including the Dean of Guild Court, the outdoor inspectors to be under his control, and in his absence the chief clerk to be responsible for the discharge of these duties. 3. That in the matter of contracts, the present practice of tenders being issued from and returned to the Master of Works department, should be altered in so far that the tenders should be returned in future to the clerk, whose duty will be to hand them to the committee ; the treasurer or clerk as heretofore being the custodier of the contracts after their acceptance by the committee. All accounts in connection with the expenditure for the various departments coming under cognisance of the Master of Works office shall be in charge of the chief clerk, who shall see to all such being duly certified by the parties in charge of the work, and, after certification by myself or assistant, hand the same to the treasurer for his further scrutiny and examination.

Tenders have been sent in for the restoration and enclosing of Banbury Cross, the lowest tender amounting to about 140*l.*

ARCHITECTS' FEES IN AMERICA.

THE subjoined schedule of fees has been adopted by the Milwaukee Association of Architects. It will be seen there are some deviations from the established practice in England and America :—

Complete drawings, specifications, &c., for dwellings, 3 per cent. ; superintendence, 2 per cent. For churches and public buildings, 3 per cent. for first 15,000 dols., and 2½ for all over that amount ; superintendence, 2 per cent. For flats, office buildings, &c., 2½ per cent. ; superintendence, 1½ per cent. For warehouses and plain stores (exclusive of fixtures), 3 per cent. ; for drawings, specifications, and superintendence, for special designs for mantels and stationary furniture, and for elaborate interior finish requiring special designs, 10 per cent. In case of the abandonment of the work the charge for partial service will be as follows for dwellings, and in the same proportion for other classes of work :—Preliminary studies, 1 per cent. ; preliminary studies, general drawings, and specifications, 2 per cent. ; preliminary studies, general drawings, specifications, and details, 3 per cent. For alterations and additions, an additional charge to be made for surveys and measurements. An additional charge to be made for alterations or additions in contracts or plans, which will be valued in proportion to the additional time and services employed, necessary travelling expenses to be paid by the client. Time spent by the architect in visiting for professional consultation and in the accompanying travel, whether day or night, will be charged for, whether or not any commission, either for office work or for supervision, is rendered. The architect's payments are successively due as his work is completed in the order of the above classification. Until the actual estimate is received the charges are based upon the estimated cost of the work, and the payments are received as instalments of the entire fee, which is based upon the actual cost. The architect bases his professional charge upon the entire cost to the owner of the building when completed, including all the fixtures necessary to render it fit for occupation, to which he is called upon to give a general supervision. This includes arranging with artists, tradesmen, and others, for stained glass, heating apparatus, and works of a similar class, for which the architect does not furnish the designs, but to which he gives his supervision. The architect is entitled to additional compensation for furniture or other articles designed or purchased by him. If any material or work used in the construction of the building be already upon the ground or come into possession of the owner without expense to him, the value of said material or work is to be added to the sum actually expended upon the building before the architect's commission is computed.

Supervision of Works.—The supervision and superintendence of an architect (as distinguished from the continuous personal superintendence which may be secured by the employment of a clerk of the works) means such inspection by the architect or his deputy, of a building or other work in process of erection, completion, or alteration, as he finds necessary to ascertain whether it is being executed in conformity with his designs and specifications or directions, and to enable him to decide when the successive instalments or payments provided for in the contract or agreement are due and payable. He is to determine in constructive emergencies, to order necessary changes, and to define the true intent and meaning of the drawings and specifications, and he has authority to stop the progress of the work, and order it removal when not in accordance with them.

Clerk of the Works.—On buildings where it is deemed necessary to employ a clerk of the works, the remuneration of said clerk is to be paid by the owner or owners, in addition to any commission or fees due the architect. The selection and dismissal of the clerk of the works are to be subject to the approval of the architect.

Extra Services.—Consultation fees for professional advice are to be paid in proportion to the importance of the question involved, at the discretion of the architect. None of the charges above enumerated cover professional or legal services connected with negotiations for site, disputed party walls, right of light, measurement of work, or services incidental to arrangements consequent upon the failure of contractors during the performance of the work. When such services become necessary they shall be charged for according to the time and trouble involved.

Drawings and Specifications.—Drawings and specifications as instruments of service are the property of the architect.

The Offer of Mr. John M'Kie, of Edinburgh, to carry out the River Cart improvement scheme at Paisley, for 68,000*l.*, has been provisionally accepted ; and a Glasgow firm, Messrs. Morrison & Mason, obtained the contract for the reconstruction of Paisley Station and works in connection, the cost of which is about 100,000*l.*

BUILDING IN GLASGOW.

At the meeting of the Glasgow Dean of Guild Court on Thursday in last week, Dr. W. G. Blackie reviewed the work of the past year. He said :—

During the past year this Court held 24 sittings, and passed 200 linings. The total value of the property in these linings was estimated at 394,540*l.* Of this amount 208,050*l.* are applicable to 42 linings, which included 1,242 dwelling-houses and 52 shops; 43,500*l.* are applicable to public buildings, including the Athenæum and the Young Women's Christian Institute, which take up about one-half of the amount, and some others; 36,900*l.* are applicable to churches, halls, and schools, included in 8 linings; 68,975*l.* are applicable to warehouses, offices, workshops, and other structures connected with business and trade, included in 68 linings; the balance of 37,115*l.* being applicable to alterations on, and additions to, structures already existing. Compared with 1885, these figures show an increase of 18 in the number of linings and 45,525*l.* in the value of the operations, a result which, taken by itself, may fairly be esteemed to be encouraging. But if last year be compared with 1884, when the value of the operations was 697,005*l.*, and 1883, when it was 594,943*l.*, any satisfaction that may arise from comparing it with 1885 becomes somewhat abated until we realise that the total amount in both of the two earlier years was greatly augmented by large public undertakings, a lining having been passed in 1884 for the municipal buildings, which itself amounted to 250,000*l.* The valuation of property passed by the Court is registered under five general headings set forth in the following table, which presents a comparison of the operations of the last five years :—

	Dwelling-houses.	Public Buildings.	Warehouses, Work-shops, &c.	Churches, Halls, Schools.	Alterations and Additions.
1886 .	£208,050	£43,500	£68,975	£36 900	£37,115
1885 .	128,650	45,500	86,055	52,900	35,910
1884 .	101,250	256,850	232,515	57,750	48,640
1883 .	88,650	102,500	291,461	35,500	76,461
1882 .	90,000	—	154 755	62,265	71,670

While there have been considerable fluctuations from year to year, as shown by this table, it is to be observed that there has been a general decrease under all the headings, except the first, indicative, manifestly, of the pressure of the times through which we have been passing. The records of this Court do not apparently supply any special evidence of this pressure being much lightened, much less coming to an end, unless it be found in the figures in the first column. During the period comprised in the table the value of the dwelling-houses and shops which have been passed has more than doubled, an enlivening feature which it may be hoped will go on from year to year, until the space suitable for the erection of dwelling-houses within the municipality is completely occupied. The following table, which shows the number of dwelling-houses passed in each of the last five years, and the number of apartments in each house, will be found interesting :—

	Houses. Apartments.						Total Houses.
	1	2	3	4	5	6	
1886. .	151	620	345	96	28	22	1,262
1885. .	114	425	203	13	6	3	764
1884. .	97	258	196	34	2	—	587
1883. .	41	199	95	27	11	18	410
1882. .	40	287	114	46	8	17	508

It is gratifying to observe that there has been a considerable increase last year all along the line, and that the greatest proportionate increase has been in the larger-sized houses. This fact, however, can hardly be taken as a sure indication of a movement towards remedying the evils of overcrowding. It is, however, so far satisfactory to observe that the operations of last year have not increased the percentage of one-room houses, which averaged 13·32 in the five years 1881–85. A further study of the figures set before you would doubtless suggest sundry other conclusions of an interesting nature, but for the present those which I have indicated may probably be deemed sufficient.

Messrs. G. Barker & Co., the bankers, of Mark Lane, have in the press and will shortly issue (through Effingham Wilson, of the Royal Exchange) an annual dealing with the trade and finance of the year. Report speaks of it as of an instructive and valuable character.

Correspondence

The Royal Academy and Education.

Sir,—I was not amazed at Mr. White's amazement when he read the article on "The Royal Academy and Education." He has been so absorbed by the preliminary stipulations that he is indifferent to anything which suggests what the infant Academy was like when it appeared in Pall Mall. If he has recovered from the effects of his amazement, which I trust were not serious, I would ask him, is there any practical difference between the statement of Reynolds, when he said they could teach students but little beyond the power to distinguish between good and bad works, and the clause of the Instrument which enjoins the delivery of six public lectures by the professor of architecture with the object of fitting the students for an unprejudiced study of books and for a critical examination of structures? Does Mr. White believe that in a course of six lectures more can be done in any branch of art than was suggested by the President? If compared with a school like the existing Ecole des Beaux-Arts, the Royal Academy in the early days when there ought to be fervour among professors, students, and patrons, must appear a very modest sort of institution. But it should not be judged by such a standard, and I therefore take the liberty of proposing a few questions, suggestive of its true character, to Mr. White, and some others on allied subjects :—

1. Is not Mr. White's idea of the Royal Academy School based on the supposition that it was founded to be a sort of comprehensive school, in which elementary work was not excluded? and has he not interpreted the words "for promoting the Arts of Design" in the Instrument rather erroneously, since he once asserted "that the word 'design' possessed a signification much more nearly allied to *dessein*, or drawing, than to 'design,' as it is understood by the modern architect?"

2. Is it not the fact that in the eighteenth century the word "design" bore a different meaning to the word "drawing," and that in the French language the equivalent of "design," considered as a technical word, was not *dessein* at that time?

3. Is it not the fact that in England the word "academy" was used in the eighteenth century to mean a place where artists met to draw from the living model and to discuss questions relating to design, that such an academy was similar to what is now called a "sketching club," and that the members were sometimes called "students?"

4. Is it not the fact that the Royal Academy was intended to be an institution of that kind on a more extended basis, and that Henry Moser, who was a principal agent in the founding of the Royal Academy, did obtain certain anatomical figures, busts, statues, lamps, and other effects, from an academy then existing, on the understanding that the members were to have the privilege of study in another academy under royal patronage without the necessity of paying an annual subscription?

5. Is it not the fact that afterwards some of those members, considering themselves to be as able artists as the majority of the Royal Academicians, declined to submit the probationary drawings which were required from all who wished to have access to the life and antique schools, lectures, and other privileges, unless they were elected Academicians?

6. Is it not the fact that certain of the members did comply with the conditions, and that in consequence the Academy contained more than one class of students?

7. Is it not the fact that the President in his discourse at the opening of the Academy recognised the distinction when he recommended certain regulations to be adopted for teaching the "young students?"

8. Is it not the fact that in the earliest engraving of the life school of the Academy the greater number of the students are shown to be men of mature age?

9. Is it not the fact that, owing to the aid afforded by the experience of the elder students, the conveniences of the schools, and the cheapness of education, the system of pupilage among painters fell into desuetude soon after the establishment of the Royal Academy, and may now be said to be abolished?

10. Is it not the fact that, in consequence, many evils have befallen the art of painting in England?

11. Is it not the fact that Dr. Waagen, the Director of the Royal Gallery of Berlin, who might be supposed to be impartial, advocated a return to that system when he stated before a Parliamentary Committee that Academies of Art as a means of teaching were injurious, and advised the English Government to imitate the action of the Prussian Government, which produced satisfactory results, and arrange with distinguished artists for opening studios into which pupils could be admitted?

12. Is it not the fact that if the Royal Academy set up a school of architecture on a large scale the system of pupilage would be abolished in architecture as well as in painting, and that much danger to the art would thereupon arise?

13. Is it not the fact that Mr. White, by advocating such a school, and by his persistent praise of men who never studied under architects such as Perrault, Lescot, Wren, and others, is aiding a scheme that would transform his profession without any advantage to the present or future members, or to the public?

14. Is it not the fact that in France the organisation for teaching artists, of which Mr. White is the eulogist, was established without any care for their benefit?

15. Is not the policy of Colbert, who created the organisation, explained by the statement of President Henault, who said:—"La protection signalée que Colbert accorda aux arts et aux sciences n'étoit pas en lui l'effet seul du goût et des connoissances; ce n'étoit pas par sentiment qu'il aimoit les artistes et les savans?"

16. Is it not a consequence of the French system, which was intended to create artists who might be instruments to assist in the glorification of the rulers of the country, that a great many men every year issue from the Ecole des Beaux-Arts who, from their peculiar education, are incompetent to undertake the ordinary duties of an architect, and, being without an official position, suffer much misery?

17. Is it not a consequence of the training of artists for State purposes in France that the condition in general of architecture in that country is far below the condition in England?

18. Is it not a fact that one architect informed the Congress of Architects assembled at Nice in 1884, and as an illustration of the character of provincial architects, that in his part of the country the profession has become so degraded that his friends were afraid to wound his feelings by calling him an architect, and preferred to call him an engineer?

19. Is it not the fact that at the same congress another architect called attention to the deplorable animosities that prevail among architects in consequence of the organisation of the French school—how Prix de Rome men look down on those who obtained only diplomas, and so on, and how the ill-feeling has unhappily extended among those who have not been students of the school?

20. Is it not the fact that the profession of architecture is at present sufficiently divided in England, and that there is no need to introduce an organisation which would further promote disunion?

21. Is it not the fact that in spite of the existence of a process for preparing Government architects in France, so little esteem is entertained for the profession that the civil code makes no distinction between architects and contractors, and every architect is responsible equally with the contractor for the stability of a building during a certain number of years, and in other ways is put on a level with him?

22. Is it not the fact that the Ecole des Beaux-Arts has failed as an educational institution, since candidates for the chief prizes have to prepare themselves outside the school?

23. Is it the fact that Mr. White's American cousins are better judges of the worth of the teaching in that school than the artists who train the successful pupils?

24. Is it not the fact that the said cousins, when they are competent to enter the school, do so in order to be able to boast of the distinction rather than for the purposes of education?

25. Is it not the fact that, while Free Trade prevails, students will naturally seek the teacher from whom they can obtain most knowledge?

26. Is it not contrary to experience, and to what is called common sense, to say with Mr. White, "While a dominant body like the Royal Academy maintains a sham school of architecture no institution in this country can succeed in establishing a real one?"

27. Is it not the fact that the Academy does not insist on attendance in its school as a qualification for membership, and that there is no just reason or impediment to prevent each of the architectural societies from opening schools if teachers and students can be found?

I have a good many other queries to put to Mr. White in respect of his letter, but I must not strain his faculty of amazement overmuch at a time.—Yours obediently,

The Writer of the Article on "The Royal Academy and Education."

CHURCH BUILDING AND RESTORATION.

Droitwich.—The memorial-stone has been laid of the new Wesleyan chapel in Newtown, which is being erected by Messrs. Reade & Sons, from the designs of Mr. George Smith. The chapel will be in Early English style, with a small wooden spire on the north gable. It will be built of red brick, with dressings of white brick and Bath stone. The chapel will be 50 feet by 30 feet, and will seat 350 persons. At the rear there will be a schoolroom, 40 feet by 20 feet.

Edgbaston.—The church of St. Bartholomew, Edgbaston, known as Old Edgbaston Church, is at present undergoing restoration and enlargement. The alterations have been designed by Mr. J. A. Chatwin, of Birmingham, and are being executed by Mr. J. Collins, of Tewkesbury.

Edinburgh.—New halls erected in Wellington Street, Ferry Road, in connection with North Leith parish church, have been opened. The new buildings, which have cost about 3,000*l.*, were designed by Mr. Hippolyte J. Blanc, Edinburgh, in the Gothic style.

Farnworth.—The new church of St. Peter has been opened. The church has been built by Messrs. Coope Bros., from the designs of Mr. R. K. Freeman, of Bolton.

Little Comberton.—The parish church has been reopened after restoration, carried out at a cost of about 1,600*l.* The work has been done by Mr. T. Collins, of Tewkesbury, from the designs of Mr. White, F.S.A.

Southowran Bank.—The corner-stone of a new mission church has been laid. The building will seat about 200 people. It will be simple in character, but substantially built, exposed as it is to the full force of the west winds. The architect is Mr. W. S. Barber, of Halifax, and the works are being carried out by Messrs. J. Charnock & Sons, contractors, Pellon Lane, Halifax.

York.—The memorial-stones of a Wesleyan chapel have been laid. The building is being built from the designs of Mr. Charles Bell, F.R.I.B.A., of London, and is to accommodate 650 persons, and will have a school and classrooms, &c., attached.

SCHOOL BUILDINGS.

Eccleshill.—A new Board school has been opened at Eccleshill, near Bradford. The contract amounted to 2,500*l.*, and accommodation is provided for 330 children. The building, which is Gothic in style, has been erected from designs prepared by Messrs. W. & J. B. Bailey, architects, Bradford.

Glasgow.—Additional buildings erected at the Crookston Street public schools have been opened. Additional accommodation has been provided for 629 pupils, and the cost has been about 7,770*l.* Mr. John Gordon, of Glasgow, is the architect.

Rutherglen.—A new Board school has been opened at Rutherglen. The school, which is square in form, is a large two-storey building, with frontages measuring 65 feet, and extensive playgrounds. The area occupied for the building is 494 square yards. The cost has been about 4,000*l.*, and the work was carried out from the plans of Mr. J. J. Craig.

NEW BUILDINGS.

Heavitree.—The new asylum for pauper lunatics, erected by the Town Council of Exeter, has been opened. The building was erected by Mr. H. Phillips, of Exeter, from the designs of Mr. R. Stark Wilkinson.

Port Glasgow.—A new library has been built from funds bequeathed by the late Mr. J. Moffat, merchant, of Port Glasgow. Early French Renaissance was adopted for the style of the building by the architects, Messrs. Wilson & Stewart, of Glasgow and Greenock.

Topsham.—The corner-stone of a new vestry hall at Topsham has been laid. The building is being erected from the designs of Mr. E. Harbottle, of Exeter.

GENERAL.

A Portrait of the Bishop of Gloucester, painted by Mr. Frank Holl, R.A., was formally presented to the bishop on Thursday last week.

The Manchester Art Museum is now located in Ancoats Old Hall, and a "house-warming" was held on Thursday to mark the event.

Mr. Andrew Cunningham, the late deputy town clerk of Glasgow, has, among other bequests, left a sum of 5,000*l.* to complete the tower of the Glasgow University.

Plans have been prepared by Mr. Demaine, of York, for the restoration of the church tower at Market Weighton, and a restoration committee has been appointed.

Herr Bartels, of Berlin, the "Councillor of Architecture," who acted as German Commissioner at the Philadelphia Exhibition in 1876, has been appointed as German Consul in Bombay. He is the first architect who has accepted a position in the German Consular Service.

Mr. James Hunter, of Glenapp, whose name has been associated with the development of the iron manufacture in Scotland for the last half century, died in Edinburgh on Tuesday.

The Architect.

THE WEEK.

An opportunity will soon be given to discover whether English connoisseurs can appreciate the works of Mr. Watts, R.A. A Mr. Rickards died lately in Manchester, and as he believed in the painter he acquired pictures by Mr. Watts which are supposed to be worth at least 10,000*l*. In his will Mr. Rickards orders that the pictures are in the first place to be offered to the nation for purchase, and then to the Manchester Corporation. If they are not purchased they are to be sent to London for sale. The National Gallery will some day possess the works which Mr. Watts has promised, but Manchester may not be able to share in the gift. The city could hardly find a better way of laying out a few thousands than in the purchase of Mr. Rickards's collection.

The Manchester Ship Canal has given rise to a project for making Paris a port, and enabling it to be as independent of Rouen as Manchester expects to be of Liverpool. But there is a vast difference in the cost of the two works. It is estimated that the canalisation of the Seine, with other works in connection, would cost about 4,500,000*l*. There are only two places in which it would be necessary to deviate from the course of the river. It is also supposed that vessels drawing nearly 20 feet of water could reach the capital, and the sight of them would be a novelty well worth paying for. The project has been supported by an admiral, who has presented a memorial on the subject to the Minister of Public Works. If a concession is obtained it is supposed there would be little difficulty in obtaining the capital.

The new Governmental bureau for collecting and publishing labour statistics is not idle. It is expected that in April or May next a very bulky and elaborate volume will be published, containing information relating to rates of wages which have been paid during the last fifty or sixty years. In order to obtain an exact record of the present rates of wages, with details about hours of labour, slackness or abundance of employment, about 60,000 blank schedules to be filled up are being sent to the principal employers of labour throughout the country. A work on the statistics of trades' unions is to be undertaken, which it is hoped will be of value not only to working men and the public generally, but even to members of trades' unions, who have little opportunity to become acquainted with the work of any of the unions except their own.

The British Consul-General, writing from Frankfort to the Foreign Office on the 7th ult., reports that in consequence of the erection of numerous Government and municipal buildings in the city, there was a greater activity in the building trade than has been felt for years. This remark does not apply to private buildings, in spite of the increase in the population. It appears from the census of 1885 that the population has increased at the rate of 12·38 per cent. as against the returns for 1880, while the number of houses occupied has only increased at the rate of 8·27 per cent.—a circumstance accounted for by the fact that the immigrants belonged chiefly to the middle-class, and gave no occasion for erecting new buildings. The import of English roof-slates has assumed greater dimensions. The export from England amounted to 211,186 double cwts. in 1884; it has risen during last year to 326,776 double cwts., as the importers were anxious to complete their stock previous to the new tariff coming into force. The total import of foreign slates amounted in 1885 to 668,000 double cwts., against 518,847 double cwts. in the preceding year. The business with England in stained and ornamental concave glass has not yet improved. It is not very likely that firms in Germany, concerned in this branch of industry, will succeed in keeping the American trade in future, as France and England are using their utmost exertions to fill the American markets, in consequence of which no orders were received from thence.

There is no statue in Paris better known than the equestrian figure of *Joan of Arc*, which stands in the Place des Pyramides, and faces the street where the Tuileries was once to be seen. It is a popular statue, especially with the representatives of Women's Rights, who generally after a meeting place a wreath or two with an inscription on the pedestal. The sculptor of this fine work is M. Frémiet. He is represented about the city by other works of a very different class. What can be more humorous, while recognising the dignity that should belong to sculpture, than his marble figure of the young faun who is initiating the two little bear cubs into the delights that abide in a piece of honeycomb? It is in the Luxembourg Museum, and in the gardens some of his work is also to be seen, in the fountains. The Gardens of the Trocadéro have groups of animals on a colossal scale by the sculptor. M. Frémiet now proposes to open a studio where amateurs as well as artists can practice sculpture. The variety of work produced by the teacher is a guarantee of the range of the instruction that will be imparted.

Edward Godwin was so distinct a personality in the little world of art that a void is left by his death which is not easily filled. Although he was neither painter nor sculptor, yet so well had he mastered their relationship with architecture that he might be said to belong to all three branches of art, and in that sense he resembled the Renaissance artists. As became a man who had made a speciality of Gothic, he was an archæologist, but not in the usual sense of that word. To his mind the past was something more than a mouldering skeleton. It lived for him, and buildings were only a background for figures. It was an easy transition when Edward Godwin passed from the architecture of the fourteenth century to the poems of Chaucer, and when he passed from a study of Shakespeare's characters to the buildings in which they were supposed to live. He was learned without having a particle of the Dryasdust about him. As an architect he was less fortunate than his friend Burges in obtaining opportunities to prove his powers, and his best designs are to be found only on paper. There is enough of them to show that he could impart grace to small as well as large works. Like all men, he was not without his weaknesses. Edward Godwin assumed an air of superiority at times, but he found many who willingly recognised his right to it. We have often thought that his removal to London did not help him as an artist. He found here too many distractions. If he had remained in Bristol he must have been more successful as an architect, and that means an enrichment of English architecture. Many of his friends believed that he might have been the first architect in England, and when it is known that Scott, Street, and Burges willingly recognised his great powers, it cannot be said that his friends were in error.

In Switzerland the employer is not relieved from liability if injury to a workman arises from the act of a fellow-workman. There is a difference between the responsibility for the condition of machinery, plant, and permanent appliances of the work, and for specific acts or defaults of workmen. But the liability of the employer is reduced if part of the fault falls on the injured workman; more especially if the latter has acted against the factory rules, or if he has discovered a default in the machinery, which was the cause of the accident, without having informed the employer himself or one in authority over him, except the injured man could prove that the employers or the superintendent were already cognisant of the faulty and dangerous condition of such machinery.

The site of the exhibition which is to be opened in Venice on April 25, 1887, is in the public garden at the end of the Quai des Esclavons. The building will have an area of about 6,000 yards, and it will be occupied by painting, sculpture in marble, bronze, and wood, mosaics, glass, and all kind of work that can be considered as related to art. The modern plan of eking out the interest by means of concerts, games, fireworks, &c., is also to be adopted; and as the exhibition is to remain open for six months, a great many people are likely to select Venice as the region for next year's holiday.

THE FURNITURE OF LOUIS XIV.*

IT is not unreasonable to believe that Carlyle's first and most characteristic book, "Sartor Resartus," was inspired by seeing the influence exercised by dandyism of the Beau Brummell sort about half a century ago. The maxim, "the tailor maketh the man," was accepted as a rule of faith in those days, and Carlyle, as a philosopher, was able to develop the important truths which are contained in the words, and to show the relation between the wise saw and the modern instances. It was only in the later years of his life that he gave much attention to his own coats and waistcoats. Dress in general was to him a subject of indifference, unless in its transcendental aspects. Had he appeared a little later in the world he might have discovered a worthier subject of speculation, and we should have an unrhymed epic of Furniture and the Man. An age to which Chippendale and spindle-shanked tables have become worthy of worship likewise deserves to have its poet and mystic.

For there is little which can be said or chanted about dress which cannot be made to serve for furniture if we give the word a wide meaning. Robes which were fashioned to excite envy among the grand dames of an imperial court may be seen doing duty in a show of waxworks on one of the Paris boulevards; but not far from them the hideous bath in which Marat met his death is also visible, and to the spectator who cares to meditate on the changes which all things undergo, it is hard to say whether the costumes worn by the fine ladies or the tub in which the unhappy horseleech sought a little rest will be the more fruitful of thought.

What would Carlyle have said if he could have beheld the two massive volumes which contain the list of the furniture of Louis XIV., and which seem like an inventory that was drawn up by Fate, acting as a broker, prior to the great catastrophe of 1789, when not only the furniture which filled palaces was dispersed, but the whole system of his predecessors, which Louis himself had perfected? When on one occasion he forgot the lessons of deportment, and chased the Marquis de Louvois round a room with a pair of tongs, the Grand Monarque was only a figure in a stately perruque of sanscullotism as it was to appear soon afterwards, with the great nobles of France fleeing before it. In like manner, when the catalogue of the treasures of the palaces was prepared by his command, Louis was getting ready a model register, which Republican stewards were to examine and utilise, and if necessary could imitate.

There were kings with larger realms and more subjects than Louis XIV.; kings with more servants, statesmen, and slaves; but we doubt if any monarch ever lived who possessed so many articles of furniture as he could claim. He might also claim the distinction of exceeding all kings, ancient and modern, in the number of his flatterers in prose and rhyme. Where he could store so much furniture is a problem which mathematicians might take up. One of the poets of that age was disgusted when he contemplated the Louvre and thought of its tenant. "When I see this palace that all the world admires," he said, "far from admiring it, I sigh to see it so limited. What! Prescribe to my prince a place so restricted? For majesty like his all the earth is too little." That may appear fulsome stuff if applied to King Louis, who was a little man when apart from his robes and trappings, but it is quite a reasonable sort of remonstrance if we fancy that it came from one of the furniture officials. Substitute "mobilier" for "prince" and "majesté," then the poem becomes quite a sensible production, especially if compared with works of its class.

It will be asked, Why did Louis order an inventory? and the answer must be, For the same reason that David took a census of his people. The French king was always thinking of his royal self, and he patronised artists, dined with dramatists, listened to praises of his genius in the Academy, made wars, and counted pieces of bijouterie with the same object. He not only believed what the poets told him—that he was king of kings, the wisest and most beautiful of men—but he wished to convince the world of the surprising facts. Louis, therefore, when writing the commission to his faithful and trusty councillor, the Seigneur Gédéon du Metz, frankly informed everybody to whom the presents might come that "there is nothing which is more suggestive of the magnificence of great princes than superb palaces and precious furniture." Hence, having given peace to his people, reformed abuses, and established good order, it was His Majesty's intention to complete the Louvre and to fill it with very rich furniture of all sorts which might be in keeping with the grandeur and majesty of that admirable edifice. The document was dated December 31, 1663. Louis was twenty-five at the time he proposed to exchange war for bric-à-brac, and as he lived until 1713 there were many opportunities during the fifty years of bringing a considerable number of objects to the palace. It is to be apprehended that the King occasionally was unable to pay for all his purchases.

As we have said, the inventory fills two thick quarto volumes of type. Everything was arranged in classes. First we have the works in gold and silver. They begin with the altar plate of gold that was given to the Crown by Cardinal Richelieu, consisting of a cross, two chandeliers, a chalice with paten, two cruets for wine and water, a ciborium, a stoup for holy water with sprinkler, a figure of the Blessed Virgin, a figure of St. Louis, and a pax. The plate was, moreover, enriched with 9,013 diamonds, 355 rubies, and 29 pearls. This formed a present worthy of a king's acceptance. The cross, by itself, was enriched with 792 diamonds. There were sixty-four works in gold, some being of a secular character. The church plate of silver numbered 132 articles. There were also 210 examples of silver-gilt work. It suggests the position which artists held in the eyes of the officers who made the inventory, when we find that it is rare to have any mention of the designers of the objects. Several of the great artists of the Renaissance must have modelled the plate, but they were commonly ignored in the registry. It is cases of this kind which reveal the insincerity of the admiration for art which was supposed to distinguish Louis XIV. and his Court. As it was said that the King imparted honour to the throne, so the beauty possessed by works of art may have been believed to be due to his ownership. Out of His Majesty's palace they would become hideous.

The objects of silver (*argent blanc*) are enumerated up to No. 1,192, when there is a break. The work was probably continued in other manuscript records which have not come down to us. This is the more to be regretted, since the goldsmiths' work that was the pride of the monarchy only exists in name. The King wished to enjoy the luxury of war. His poets told him he was invincible, that the gods were in fear of him, and that it was better for a country to have all the Olympians for enemies than His Sacred Majesty. He was said to be more than Alexander the Great, and, as it was necessary to keep up the reputation for truth of the forty venerable Academicians who prayed that Heaven might allow them to write and think, and protect the French language with the power displayed by the King in war, to war the King often went. In spite of the wonderful victories which Racine and Boileau were employed to record, there was the commonplace difficulty of sending money to feed the soldiers. The silver plate had to go to the melting-pot. The reader on looking over the inventory will find asterisks against the numbers on almost every page. They stand for the marks which were affixed by the keepers as the different pieces left their possession to be transformed into coin.

But the royal service did not suffer much by the removal of pieces of plate, and Madame Sevigné recorded the event as if the King needed no condolence. M. Guiffrey, the editor, is somewhat shocked when he has to describe the ostentatious prodigality that reigned in the household, and of which the number and weight of the dishes, flagons, goblets, and other utensils for the table are evidence. He evidently was in doubt about giving such information. Then there were the utensils for other kinds of service. Macaulay tells us how the King took his emetics in state and vomited majestically in the presence of the *grandes* and *petites entrées*. On those interesting occasions the privileged persons were able to observe that all the apparatus called into use must be of gold or silver. The royal boluses, clysters, and alteratives were compounded only in vessels of silver.

* *Inventaire Général du Mobilier de la Couronne sous Louis XIV.* (1663-1715). *Publié pour la première fois.* Par Jules Guiffrey. Paris: J. Rouam. London: Gilbert Wood & Co.

Several of the objects in the glass cases of the Louvre, and especially in the Gallery of Apollo, at one time formed part of the collection of Louis XIV. M. Guiffrey does not, however, identify them. He leaves that task to the reader. But his volumes would have vastly increased in value if he had made some effort towards connecting the national collection with the King's. If a reader were possessed of time the identification would be a pleasing exercise in archæology, but we are afraid few will venture on it.

The part relating to tapestry is of importance for several reasons. It is evidence that the Gobelins factory was at that time able to undertake the most difficult classes of weaving. The King's collection contained 334 works, forming 2,600 pieces, besides 140 pieces that are not easily classified. Now it is found by the inventory that the Gobelins was represented by 822 pieces, or 101 works—that is, nearly one-third of the entire number. It is worth noting also that England supplied several works. An elaborate pictorial work of the story of Vulcan is said to have been wrought at Mortlake from a cartoon by Raphael. Tapestry might be supposed to endure the vicissitudes of more than two centuries. It is evident that several of the more important works in the inventory have disappeared. There would be no advantage in destroying pieces of tapestry, and they could not be applied to other purposes. A search might lead to the discovery of some, and this forms another opportunity for amateurs of an investigating turn.

The part relating to pictures is disappointing ; indeed, in its vagueness it bears a close resemblance to the catalogues of auctions in which pictures are sold of doubtful authenticity. Apparently Louis XIV. did not care much for a picture unless it represented himself. There are several portraits of Court beauties and other dames, all of which are probably in the retirement of the garrets of Versailles. The indifference of the compilers to artists is again exhibited in this part of their work. Can we suppose the fine gentleman of the time admired a picture without asking the name of the painter? The same neglect is seen in the list of statues and busts. The only name that appears is that of Bernini, who in those days was greatly esteemed in the French Court.

The collection of arms contained 350 objects, and therefore corresponded with the position of so famous a warrior. The porcelain follows in the inventory, and then the chandeliers and girandoles of crystal, which amount to 232 pieces. The latter was a class of work that was in vogue at the time. Some of the light-holders—such as the one for the throne-room at Versailles—were of large dimensions and elaborate in execution.

The list of cabinets is enough to excite the envy of a collector. It is often possible to imagine what the furniture was from the matter-of-fact description of the inventory maker. Thus one cabinet of ebony was known as the "Cabinet de la Paix." It was said to be "all covered with jasper, lapis lazuli, and agates," but the words refer to the spaces where ornament of another kind was not found. The lower part was ornamented with a portico, having a niche containing a statue of Louis XIV. as Mars. Above were the arms of France supported by angels, and at the sides were four figures of heroes in high relief. The upper part had also a niche with a figure of Peace. There were also figures emblematic of the principal rivers of the world. A companion cabinet was adorned with the figure of the Queen, and Virtues were substituted for heroes. Another cabinet is described as an example of marquetry ; the "fond" was of ivory, with leaves and flowers of divers colours in wood. There were eight ivory Corinthian columns in front, the shafts were stained to look like jasper, and the capitals and vases were of gilt copper. The cornice of the attic was carried by twelve caryatides of gilt copper. Above were the arms of His Majesty, accompanied by two figures of Fame, with sundry other ornaments of gilt copper. The cabinet was carried by a marquetry base enriched by metal work. But what must have been the quality of cabinets which the clerk was forced to describe as "grandissime"? On one was a figure of Louis as Apollo in a chariot drawn by four horses ; below were seventeen figures in relief, all being in gilt bronze. There were two columns of avanturine (not the imitation stuff) with Corinthian capitals, and several other precious stones were utilised in the composition. The inventory of cabinets, and similar pieces of furniture, fills fifty pages of print.

To judge from the descriptions, several of the beds seem to have been temples dedicated to Somnus, and many buildings of the sort may have had less painting, sculpture, embroidery, and tapestry about them. It must have been a relief to escape from a stuffy "lit extraordinaire" to a "lit de sangle," that is, a bed suspended by straps of the hammock class. The barges on the canal at Versailles were likewise crowded with rich materials. The "brigantin" had a style of its own, the "chaloupe verte" was fitted up in green, the "chaloupe jaune" in yellow, the "chaloupe bleu" in blue, and there were other vessels in violet, red, green, and white. One majestic canal boat must have had as much furniture as a man-of-war.

The furniture is so endless that the inventory becomes exhausting. It is unique among State documents. Historians and poets have been satisfied to use their imagination in describing the luxury of palaces, but here we have a detailed statement which appears to be as accurate as any composition of the kind by a duly licensed appraiser. The inventories of the contents of English palaces, which have been published, appear absurd by the side of the two volumes. It was a common practice among the writers about the Court of Louis XIV. to say there was no use in writing a history of their time, for the deeds being unprecedented, posterity would suppose truth to be fable. If any of these gentlemen described the contents of the King's palaces the account would be treated as if it resembled the descriptions in the "Arabian Nights." M. Guiffrey's two volumes contain evidence that cannot be impugned in respect of the luxury which surrounded Louis. But costly as the furniture may have been, it did not cause the bankruptcy of the King. As he told his little successor—a boy of five years—Louis loved war overmuch ; he loved it even more than furniture, and any one of his marshals was more expensive than a hundred Boulles and his assistant *ébénistes*. It must, however, have been the palmy days of the furniture trade. The King not only was lavish in his expenditure, but every loyal noble and gentleman felt it was his duty to imitate his Sovereign. But in spite of its costliness, most of the work of the time has fallen into disrepute.

The volumes which M. Guiffrey has edited are published under the auspices of the "Société d'encouragement pour la propagation des livres d'art," and without such aid they could hardly appear. The work can appeal to amateurs, and for them every entry will have interest. Many of the words employed are now obsolete, but care is taken to give explanations of them.

THE ARCHITECTURAL ASSOCIATION.

LAST Friday evening the annual conversazione of the Association was held at 9 Conduit Street, the rooms of the Royal Institute of British Architects having been placed at the disposal of the members to supplement their usual accommodation. A large gathering of members and their friends were assembled, and the evening's entertainment was most successful. As Mr. J. A. Gotch, the president, through an accident, was unable to attend, Mr. John Slater received the visitors. The proceedings were purely of a social character, and during the evening a varied programme of music was executed by the band of the 2nd Life Guards, conducted by Trumpet-Major J. J. Barrett. Much interest was afforded by the introduction of a concert as part of the entertainment. During the interval between the two parts of the concert Mr. Cole A. Adams gave some dramatic sketches of an amusing character, very similar to Mr. Corney Grain's in style. Mr. Adams went in rapid review through various phases of the drama, his illustrations being taken from the modern stage ; farce, comedy, &c., transpontine drama, and the impressions left on the mind of a playgoer who was unacquainted with the French language were admirably rendered.

The concert comprised the following programme :—Mr. F. R. Kinkee gave a pianoforte solo, "Rondo Piacevole," by Sterndale Bennett. Songs followed :—"The Eyes of Heaven" (M. Valerii White) and "My Love is Come" (Marzials), by Mr. Harold Savery ; "The Last Milestone" (Pontet), by Miss Edith Touzeau ; "I'm a Roamer" (Mendelssohn), by Mr. W. H. Brereton ; and "The Angel Guardian" (Austin), by Miss Mary Morgan. The second part began by a solo on the pianoforte,

"March à la Fantasia" (F. R. Kinkee), by Mr. F. R. Kinkee; after which "Only Once More" (Moir) was sung by Mr. Harold Savery; "The Harp that Once" (Moore), by Miss Edith Touzeau; "The Leathern Bottle" (old song), by Mr. W. H. Brereton; and "Old Fashions" (Milton Wellings), by Miss Mary Morgan—Mrs. Dyke being the accompanist. Messrs. Kirkman & Son kindly lent one of their concert steel grand pianofortes for the evening. The singers had most generously given their services for the entertainment of the members, practitioners in another sphere of art. The ladies and gentlemen who represented the art musical are singers of note; Miss Mary Morgan quite lately has added to her reputation at the Gloucester Festival.

Among the works exhibited in the different rooms were a number of water-colour drawings by Mr. R. Phené Spiers, being illustrations principally from the Loire, with one of Winchelsea and a scene in Holland. Mr. Sydney Vacher had several cases of rare ivories, casts, &c. Photographs were spread about the library, of views taken during the annual excursion of the Association, during the visit to Oxford, and the results from two days in France, the photographs being by Mr. J. L. Robinson. The prize drawings executed by the members formed a large array on the walls of the Institute hall.

The following is the Prize-list:—

A.A. Travelling Studentship.—First prize and medal, R. W. Paul; second prize of 5*l.*, T. E. Key.

A.A. Medal.—10*l.* 10*s.*, W. A. Webb; hon. mention, H. P. B. Downing, W. F. Kelsey, W. H. Raffles, H. H. Gordon.

Essay Prize.—10*l.* 10*s.*, H. E. Mellett; extra medal suggested by judges, T. L. Worthington; hon. mention, A. B. Mitchell, T. E. Key, H. Wilson.

A. Union Company's Prize.—First prize 5*l.*, H. J. White; second prize 2*l.* 10*s.*, J. M. Brooks.

Elementary Class of Design.—Section I. First prize 2*l.* 2*s.*, H. S. Wood; second prize 1*l.* 1*s.*, H. G. Lidstone; hon. mention, L. Jacob. *Section II.* First prize 2*l.* 2*s.*, A. B. Yeates; second prize 1*l.* 1*s.*, H. S. Wood; hon. mention, B. M. Southall.

Elementary Class of Construction.—First prize 3*l.* 3*s.*, B. M. Southall; second prize 2*l.* 2*s.*, T. C. Agutter.

Class of Design.—First prize 3*l.* 3*s.*, R. A. Rix; second prize 2*l.* 2*s.*, E. F. L. Seaman.

Class of Colour Decoration.—3*l.* 3*s.*, and with it Mr. S. Vacher's prize, H. Wilson.

Class of Construction.—First prize 3*l.* 3*s.*, C. C. Winmill; second prize 2*l.* 2*s*, R. A. Rix.

Advanced Class of Construction.—Prize of 3*l.* 3*s.*, J. Hudson.

Class for Study of Quantities and Specifications.—First prize 3*l.* 3*s.*, E. J. Cooper; second prize 2*l.* 2*s.*, J. Hudson; hon. mention, B. Potter.

Sketch Book Title Page.—First prize 5*l.* 5*s.*, G. G. Woodward; second prize 4*l.* 4*s.*, S. Vacher; third prize 3*l.* 3*s.*, J. Oakeshott.

Lectures in connection with Classes of Design.—First prize 3*l.* 3*s.*, B. M. Southall.

Lectures in connection with Classes of Construction.—First prize 3*l.* 3*s.*, T. C. Agutter; second prize 2*l.* 2*s.*, W. D. Gravell; third prize 1*l.* 1*s.*, B. F. Fletcher.

A number of high-class firms responded to the invitation of the hon. secretaries to send specimens of artistic work for exhibition, and it will be conceded that an interesting little exhibition of works of art was got together. To give a slight sketch of the exhibits:—

Messrs. Doulton & Co. sent many most handsome examples of their Lambeth pottery. As is well known, these beautiful objects are all the work of artists: each is a work of original design of which no duplicate is made. Two charming vases were the work respectively of Miss Barlow and Miss Florence Barlow. Miss Barlow, we believe, has been longer connected with this firm than any others on the artistic staff. On the vase is a spirited scene of animal life, the horses being depicted by incision, while in Miss Florence Barlow's the animals are painted. A vase of Lambeth *faïence* was a lovely work of the potter's art. Another of what is called Silicon mosaic, having an effective circle ornament for the groundwork, appears to be a novelty. In addition to whatever artistic merit may be bestowed on this Silicon by means of design, a peculiarity is observed in the absence of any glaze, which, under certain circumstances of lighting and position, is a decided advantage to the eye of the beholder. Mr. George Tinworth's well-known work was represented by a panel containing the word "Genesis." Grouped about each of the letters of the word, which served to suggest compartments in the panel, were carved scenes from the life of Adam and Eve. Many other ornamental objects of great interest were to be seen, and among the designs the apple blossom on a soft green ground was second to none. The enamel-painting by means, we believe, of coloured clays on stoneware body, is newly introduced.

Messrs. Jeffreys & Co. on this occasion contributed a goodly show of wall-papers of their newest designs, including specimens of embossed leather papers, flocks, hand-painted and inexpensive machine-printed papers. The names of the designers are familiar, several of them members of the Association, viz., Messrs. Lewis F. Day, J. D. Sedding, Sydney Vacher, Walter Crane, Brightwen Binyon, E. Swinfen Harris, G. E. Fox, F. Vincent Hunt, A. Silver, &c. A bright lively paper amongst the machine-printed papers, "The House that Jack Built," would not escape attention as a new nursery paper designed by Mr. Walter Crane. The "Golden Age," an embossed leather paper, may already have been seen by some at the Edinburgh or Liverpool Exhibitions. This is designed by Mr. Walter Crane. The hand of Mr. Lewis F. Day would be readily traced in a boldly treated design for staircase decoration.

Messrs. H. Scott, Richmond & Co.'s name appeared over a handsome collection of silks, tapestries, wall-papers, &c. These, which were all designed by Mr. H. H. Mott, the senior partner in the firm, included a reproduction of an old fabric—late sixteenth-century work—gold on a soft olive ground; a specimen of work in grey-blue and old red, done for a well-known firm of architects, to go behind an old tapestry; a remarkable hanging, all cotton, with chintz flowers on silver-grey ground; a handsomely-designed fabric in wool; a reproduction, but slightly modified, of a rich old brocade, in which the colours are all hand-sewn; a special yellow in silk damask; a rose du Barri; and a rich combination in dove-green and silver. One cretonne was shown, and some interest attached to the design, as it was mainly taken from an Indian tent in Mr. Mott's possession. A fragment of an old Italian silk formed the basis of a clever reproduction of old work, in which it would be difficult to point out the missing details of the original design that have been restored in harmony with the lines suggested by the existing fragment. A variety of wall-papers were arranged on the wall above the tapestries. The designs are copyright, and the papers themselves are becoming popular.

Messrs. Laing, Wharton & Down spared evidently no pains to add considerable interest to the proceedings of the evening by their exhibition of electric lighting. The lamp fittings, &c., designed by Mr. Benson, were particularly noticed as quite a new departure from the usual hammered work. They have taken the fancy of the Prince of Wales, who has had them introduced at Marlborough House.

Messrs. Morris & Co. contributed a selection from their tapestries and wall-papers, and among them the thistle, chrysanthemum, and the wild tulip papers, one of the features in this latter pretty design appearing to be the effect sought by a careful arrangement of spots. There was a specimen of a richly-worked embossed velvet, the pattern being probably unique. An example of a carpet showed, perhaps, the nearest approach in rugs to old Oriental work that could be now met with. A woollen fabric, designed in low tones on blue ground, was a peacock tapestry, those aristocratic birds being prominent in the work. Several other interesting specimens completed the collection shown.

Messrs. Hart & Co., metal workers, had sent a nice collection of domestic and ecclesiastical metal work, and though their work is too well known to need describing, they were able to show articles of much artistic merit which were probably new to many. Among these was furniture for a writing-table, with candlesticks, &c., worked in metal, a feature of which was the delicate grey filagree inlaid in the ornamental brass work. Also there were handsome bronze or rather gun-metal candlesticks. This material, gun-metal, was shown also in contrast with ornamental wrought-iron work, the effect of the two together being rather admired now. Messrs. Hart & Co. have had a customer for it in the Prince of Wales, for Sandringham.

Messrs. Longden & Co. had examples of ornamental work mostly in regard of fireplaces and fireplace fittings, bronze and other ornamental fire-dogs, samples of brass *repoussé* work, &c. Dr. Salviati & Co. sent a collection of their wares specially selected for the occasion. Mr. Alfred Newman showed among the articles he sent quaint specimens of wrought-iron work after old work. Mr. Wm. de Morgan, among his samples of pottery, sent some fine vases, &c., a peacock tile panel, and specimens of ornamental tile work. Messrs. Shuffrey & Co., chimneypieces, &c., in marble, wood, &c. Messrs. Jackson & Sons, an extensive display of their decorative work in fibrous plaster, of which they manufacture friezes, cornices, ceilings, &c.—a material so light that it admits of ornamental treatment, which would be dangerous to attempt in such heavy substances as ordinary plaster. Messrs. Verity & Sons brought for display a nice assortment of art metal work and electric lighting appliances.

Messrs. Knowles & Essex had a large collection of artistic wall-papers, including examples of raised-flock decoration, frosted gold, crystal damask, &c.

Messrs. Wm. Woollams & Co. sent a large selection of non-arsenical wall papers, special designs by various artists, and handsome samples of Tergorine—a kind of imitation leather—the designs being effected by embossing, lacquering, painting, &c.

Mr. Montagu H. Scott took part in the electric exhibition, and showed in action some table lights. These consist of a primary battery within an ornamental metal casing, the whole occupying no more standing space than an ordinary small table lamp, and giving light for several hours without replenishing. Mr. Scott has in hand also a cellar lamp, a particularity of which is it lights up at once on being taken in the hand, and is self-extinguishing when put down, but this extinction of the light can be prevented as long as necessary if wanted.

Messrs. Farmer & Brindley showed handsome marbles and inlaid marble work, together with a most extensive collection of very old wood-carving, ecclesiastical and domestic, the result evidently of many years' collecting here and abroad.

COMPETITIONS IN FRANCE.

IT is often supposed that in France competitions are managed on a more equitable principle than in England. The French have not as many opportunities for venting grievances as we have in London, and, in consequence, the knowledge of strange transactions is confined to those who perpetrated them and those who suffered by them. But from time to time there are revelations, and if we may judge from letters which appear in the last number of *La Construction Moderne*, the town of Bordeaux has been lately the scene of as odd a way of arriving at the best design as will be found in the annals of English competitions. It is difficult to understand why architects of the standing of MM. Garnier, Sedille, and Pascal, whose names are associated with the affair, do not protest against the conduct of the authorities towards them. They were appointed as judges, but the selection of the designs in the first competition took place in their absence. English Town councils do not all believe in the advantage of assessors—but when one is appointed he is allowed to go through the process of examination of all the designs, although his recommendation may not be accepted. The French judges can be ignored in the most important part of the inquiry, and apparently they have too much respect for authority to whisper a remonstrance. The two letters we give will more clearly reveal the competitive system of France.

First comes a letter from a correspondent of the journal. He writes :—"The judgment in the Bordeaux competition has been given in the second trial, as you will see. The jury who were charged with the examination of the plans for the transformation of the lecture-room of the old Faculty of Letters in the Rue Monbazon into an assembly-room for the Municipal Council, met at the Hôtel de Ville on September 29, at nine o'clock in the morning, and proceeded to examine the four designs forming the second stage of the competition. With the jurors were associated MM. Charles Garnier, member of the Institut and director of the Academy of Fine Arts; Paul Sedille, vice-president of the Societé Centrale des Architectes; and Pascal, architect of the Bibliothèque Nationale. The classification was as follows :—

"No. 1. 'Virtus,' by MM. Moulinié and Bergerot.

"No. 2. 'Subjove,' by MM. Larregien and Courrégelongue.

"No. 3. *Ex æquo*, 'Minerve,' by M. Bontemps; and 'Honos alit artes,' by M. Lacombe.

"An exhibition of the designs will shortly be held in one of the rooms of the Hôtel de Ville.

"The eminent architects who desired to join the local jury for this adjudication had not seen the sketches of the twenty-one competitors, and it is a fault on the part of the municipality to have refrained from asking their aid in the first stage of the competition, for the jury of Bordeaux had made a selection which would not be ratified by such high and independent personages. The four prizemen are :—

"1. M. Moulinié, an employé by M. Charles Durand, a member of the jury.

"2. M. Larregien, patronised by M. Olagnier, a member of the jury.

"3. M. Bontemps, an employé of M. Valleton, a member of the jury.

"4. M. Lacombe, an employé of M. Charles Durand, a member of the jury. *Quod erat demonstrandum.*"

M. Duprat, an architect, has addressed the following letter to the mayor and municipal councillors of Bordeaux :—

"You have instituted a public competition between the architects of Bordeaux for the construction of the buildings of the old Faculté des Lettres into a hall for the meetings of the Municipal Council. This competition had two stages, the first of sketches, which was closed on March 31, 1886. Although limited to the department of Gironde, twenty-one competitors presented themselves.

"Contrary to custom, there was no public exhibition of these designs. Judgment was, however, given. There was no clause in the programme indicating so novel a procedure, I believe.

"A second competition for a school in the Rue Belcier has been instituted, and the judgment given under similar circumstances. But about it I need say but little, since many architects in addition to myself took no share in it.

"Is it not extraordinary that in the competition for the Council Chamber the competitors were not admitted to examine the collection of projects? It appears the Municipal Council has not seen them. The public, who will have to pay for the work, has not seen them. Men who are interested in buildings, and who go far to see designs, the students of the school of design—everybody in fact—have not seen them. What was there to conceal? According to the jury, the competition of sketches was remarkable. If so, why were not the people of Bordeaux allowed the advantage of profiting by such a collection of studies in the art of construction? An exhibition of architecture is always interesting. By it people are taught how to read a plan, and how to judge, and it sometimes helps to form their taste.

"But what is still more grave in this competition is the composition of the jury. The masters and friends of certain competitors would naturally select their sketches. Is that loyal to all? It is far from my thought to have any suspicion of unfairness, but it is certain that a design which is worked out under the direction and inspiration of a master will always appear to him to be clearer and better conceived than a work which comes before him abruptly, and of which he has not had the leisure to study the detail, and which, moreover, may exemplify some other principles than his own. Strange to say, the second competition could not be decided without the aid of architects who were strangers to Bordeaux! It is due to yourselves, Messieurs, to put a stop to every unworthy suspicion and unfriendly rumour by setting aside the first judgment, by recalling the sketches of the first competition, by holding an exhibition of them, and by delivering an impartial and unassailable judgment.

"It is only a sentiment of justice which obliges me to write this letter, and I declare that, if I happened to be successful, I should renounce my reward in favour of the poor of Bordeaux."

RUNIC CROSSES.

AN address was delivered by Professor Boyd Dawkins at the opening meeting of the Lancashire and Cheshire Antiquarian Society on the study of ancient art, referring particularly to early Christian art as exhibited in the ornamentation of Runic crosses. That ornamentation, he said, had always been believed to be due to the early Irish missionaries. The illuminations of the Irish missals and the ornamentation on the crosses were of the same character, and hitherto most people had believed that both were the work of the early Irish missionaries. Indeed, many of his friends had regarded him as heretical because he had expressed the opinion that the Irish missionaries had very little to do with either. That opinion he held very strongly, and he thought his opinion could be shown to be the right one. The ornamentation on Runic crosses could be clearly divided into two parts. One portion of it was, he believed, directly traceable to the ancient Etruscans, whilst the other portion was equally clearly traceable to the ancient Germans. The invasions of the Germans and the consequent fusion of the peoples led to the combination of the two portions, and he held that all the early Irish missionaries did was to foster and diffuse the art.

TESSERÆ.

Salisbury Cathedral.

J. Fergusson.

BESIDES the ornamental disposition of masses, any one building may be so ornamentally arranged as to produce the best possible architectural effect without ornament, or with only the smallest possible amount of applied decoration. The Gothic architects were the great masters in this department of art. Take, for instance, Salisbury Cathedral. The windows are without mullions, the buttresses without pinnacles, and with very few mouldings, while the walls are singularly plain; yet with all this the nave, the transepts, and the choir are so pleasingly arranged as to produce the best effect; and if you come to look closely into it you will find that the problem being given of producing a vaulted hall of a certain height to cover a given area of floor space, it would be hardly possible to do it at less expense. The buttresses, for instance, on which the external effect mainly depends, are the most economical way of disposing of the quantity of materials required for the purpose, and the intersecting transepts the cheapest conceivable mode of roofing a great area of floor space, and at the same time of making a small building look large internally as well as externally. The Italian architects, who neglected these expedients, used in consequence three or four times the quantity of material which the Gothic architects employed. In St.

Paul's, for instance, one of the most mechanically perfect of modern buildings, the area of the solids as compared with the voids is 1 to 6, St. Peter's as 1 to 4, St. Isaac's and other churches about the same; while at Salisbury, and in most early Mediæval buildings, it is as 1 to 8, and in later Gothic buildings it generally may be quoted as 1 in 10, and in some in even a lower proportion than that.

Blue Lias Lime in Mortar.

Sir C. W. Pasley, R.E.

Blue lias lime will not make good mortar if mixed with more than 2 cubic feet of sand to one of lime. This opinion first formed by me from analogy, and in consideration of the blue lias approaching very nearly to a water cement, proved on due inquiry to be borne out by, and exactly conformable to, the practice of the masons of Lyme Regis. But Captain Savage of the Royal Engineers, who was employed professionally some years ago in improving the cobb or pier of that little seaport, which was done by tide work, and in which no other kind of lime was used, assured me that he found that a smaller proportion of sand than two to one made still better mortar. We have since ascertained by repeated experiments at Chatham, that 1 cubic foot of blue lias lime from the kiln weighing 47 lbs., mixed with 2 cubic feet of sand, and about three-quarters of a cubic foot of water, made mortar fit for use, but which could not have borne more sand without becoming too short. The average quantity produced was 2 cubic feet and one-fifth, which, contrary to the result obtained with the purer limes, occupied more space than the sand alone originally did. We found also that blue lias lime from the kiln, like all the other limes that we experimented upon, filled only about two-thirds of its original measure, when reduced by pounding to the state of quicklime powder; but 1 cubic foot of blue lias lime, when slaked, only dilated into 1 cubic foot and a third of slaked lime powder, not including about one-eighteenth part of a cubic foot of core, which we threw away. Hence it expands less by slaking than either chalk lime or Halling lime.

Laminæ of Slates.

A. Ure.

It deserves to be noticed that blocks of slate may lose their property of divisibility into thin laminæ. This happens from long exposure to the air, after they have been quarried. The workmen say, then, that they have lost their waters. For this reason the number of splitters ought to be always proportioned to the number of block-hewers. Frost renders the blocks more fissile; but a supervening thaw renders them quite refractory. A new frost restores the faculty of splitting, though not to the same degree, and the workmen, therefore, avail themselves of it without delay. A succession of frosts and thaws renders the quarried blocks quite intractable.

Spanish Cathedrals.

F. Y. Hurlstone.

There are some arrangements in respect to the Spanish Gothic cathedrals which mark them as distinct from the cathedrals of this country, France, or Germany. The great altar is in nearly every instance isolated, the side aisles passing round it, and is placed east of the crucero or transept. The choir, or coro, is on the opposite side of the transept, and is also isolated. Immediately over the crucero, or intersection of the nave and transept, is the cimborio, a compromise between a Gothic octagonal tower and a dome, often of exceeding beauty. The trascoro is the back or outer side of the coro, relieved throughout with chapels. There is generally no gate or opening for entrance to the coro anywhere but by the transept, so that upon entering the western or principal entrance to the cathedral, you have before you the back of the coro, which shuts out of sight the high altar, which for effect would be much better seen upon entering. The rejas, or brass or iron gates and railings which enclose the choirs, altars, and chapel, are of extraordinary and peculiar beauty, and are characteristic of Spanish cathedrals. It was in the great time a branch of art of itself, and the rejeros, or ornamental iron-workers, justly figure in the lists of illustrious artists. The most celebrated were Villapando, Dominge de Cespedes, and Anenas of Cuença. Those rejas are of wrought-iron or brass, with forms and figures of the most exquisite designs. In the Spanish cathedrals, the number of sacristies is a remarkable feature. Besides the principal one for the ordinary service of the church, many of the larger chapels have their own attached. The Spanish cathedrals have also a segrario, or chapel, where the sacrament is administered and the host kept; often a separate building, like the baptistery was with the Italians. The cathedral has also almost always attached to it the parish church, which sometimes performs the double office of segrario. This of itself, as at Seville, is frequently of imposing dimensions. The retable, the structure which fills the space of the high altar in Spain, is usually of three or four ranges of architecture one above the other, with columns, entablatures, and other parts ornamented with statues, bas-reliefs and paintings, the finest works of the school. The cathedrals of Spain have also some distinguishing characteristics amongst themselves in the different provinces. Thus, those of Catalonia, for instance, besides the remarkable shortness of the nave and aisles in proportion to the width, giving the church a compressed look, have always the principal entrance reached by a lofty flight of steps, of circular form, as the cathedrals of Barcelona and Gerona.

Professor Cockerell, R.A.

T. L. Donaldson.

Throughout his whole life architecture was to Mr. Cockerell what Coleridge describes poetry to have been to himself. "Poetry," he said, "has been to me an exceeding great reward. It has soothed my afflictions; it has multiplied and refined my enjoyments; it has endeared solitude, and has given me the habit of wishing to discover the good and beautiful in all that meets and surrounds me." So was architecture Cockerell's passion and delight. He followed it not from mere mercenary considerations; he spared not himself to revise, correct, and chasten each vivid idea as it presented itself to his fancy, and which he appropriated to his work on hand; he was never weary if he could improve, and, anxious for novelty, he occasionally transgressed the severe principles of the antique. In fact, if fault could be attributed to a man of such genius, he was, perhaps, often too fastidious, and occasionally ready to retouch and to adopt a supposed improvement where possibly the original thought was simpler, wiser. In him the young architect found an encouraging monitor, and one of kindred feeling—ever ready to assist and discover latent talent. And perhaps one of the most remarkable traits in his character was that, with all his prepossession for the chaste and simple sublimity of Greek art, he could bow, as before a superior and supreme spirit, to the genius of Wren, whose noble productions are at such variance with the supposed canons of antiquity.

The Travellers' Club and the Pandolfini Palace.

Sir M. D. Wyatt.

In the designs for the Travellers' Club, which were submitted in limited competition, Barry first revealed his resources in planning and that refined perception of just proportion, both in detail and general distribution, in which he has scarcely ever been rivalled. The garden front is, so far as my knowledge extends, an absolutely original conception, and as such may, I consider, take its place in the history of art. The Pall Mall front has been frequently characterised by superficial observers as a copy or reproduction, with slight modifications, from Raphael's Pandolfini Palace at Florence. One moment's comparison of the two elevations will suffice to entirely dispel the idea. The Pandolfini Palace has only in common with the Travellers' Club-house the accidents of being two-storeyed, having rusticated angles, and a doorway at the extreme right-hand side of the ground floor. In every other respect the dissimilarities are most striking. The proportions of the windows are about one-third narrower in the Travellers' than they are in the Pandolfini; in the former they are Ionic on the first floor and Doric on the ground, while in the latter they are Corinthian on the first floor, and have simply returned architraves and no order on the ground floor. The four windows of the first floor of the Florentine façade are surmounted with alternately angular and segmental pediments, and united by panels in the interspaces and horizontal members, while the five of the Pall Mall building are precisely uniform, and the wall is entirely free from panelling, and the running through of any of the members forming or decorating the fenestration above the cill level. One of the leading features of the Pandolfini is its deep plain frieze, adorned only with a very simple classic-looking inscription; while in the entablature of the Travellers' Club the frieze is reduced to so small a proportion, and is so highly carved, as in fact to do duty rather as an enriched member of the cornice than as a distinctive frieze at all.

Malling Keep.

J. H. Parker.

Having thus ascertained, by the best possible authority, that Malling was the usual place of residence of Bishop Gundulph, the next question naturally is, are there any remains of his house? Fortunately there are: it is perfect except the roof and the parapet. He lived, according to the fashion of his age, in a massive Norman keep, very much upon the same plan (though smaller and earlier) with the White Tower, which he built for the king. This house, castle, keep, or tower, for it may be called by any of these names, I believe to be the very earliest Norman keep we have remaining anywhere, either in England or Normandy. It is probably the earliest building that Gundulph erected on his first arrival in England; it was necessary for him to build a secure place for himself to live in, and the character of this building is certainly earlier than that

of any of the others. A bold theorist might venture to assert that Gundulph was the inventor of the Norman keep, and it would be difficult to disprove the theory by referring to one of earlier character, or known to be of earlier date. It is certain that in the Bayeux tapestry, some of William's castles are distinctly represented as consisting of earthworks and wooden palisades only, and that at Dol the soldiers are ordered to dig a castle (*fossare castellum*). That this form of castle was of Norman origin there is no question. It goes by the name of a Norman keep or donjon all over Europe, and continued to be used or copied for several centuries as the place of security in the last resort. This form of castle or keep was used both in Scotland and in Ireland, and even in Italy, as late as the sixteenth century, so that it continued in use for five centuries. This one at Malling I believe to be the earliest now in existence, and it is built entirely of rubble or rough stone, with scarcely any ashlar work about it. There are rows of putlog holes for throwing out wooden galleries. These galleries are called by the French *hourds*, a word evidently borrowed from the English "hoards," or boards, which we still retain in "hoarding," a term still in every-day use in the streets of London, and it is not a French word. So many of our technical words come from the French or the Normans, that it is interesting to find an example the other way.

Strength of Buckled Plates.

W. Humber.

A 3-foot square buckled plate of ordinary Staffordshire iron, ¼ of an inch thick, with a fillet 2 inches wide, and the total curvature amounting to 1¾ inches, supported only all round, requires 9 tons weight, diffused over about half the surface at the crown to produce failure, and double this, or 18 tons, to cripple it if it be firmly bolted or rivetted down all round its edge. A similar plate of soft puddled-steel will bear nearly double the weight, or 35 tons per square yard. The buckled plates used in the construction of New Westminster Bridge, each averaging 7 feet by 3 feet, and being a ¼ of an inch thick, were proved by lowering upon the crown of each a block of granite weighing 17 tons, which did not produce injury; the plates have a curvature of 3½ inches. In bridge flooring the plates should only be subjected to one-sixth of the crippling load.

Egyptian Architecture.

Sir J. G. Wilkinson.

I can fully appreciate the merits of Egyptian architecture but I can see its faults; and though I admire the vastness o conception, the knowledge of constructiveness, the skill they showed in sculpturing as well as in transporting granite, I must allow that the Egyptians were deficient in real taste; and while it is the exception to find any object of Greek workmanship deficient in grace and beauty, it is the exception in Egypt to find it possess those high recommendations. There is little that we can adopt from the Egyptians, either as tasteful in itself or adapted to the style of our monuments. The curve of the cornice, which is broad in its character, the simple shaft of one of the old Egyptian columns, with its graceful shallow grooves (the prototype of the Greek Doric), and a few devices—as the papyrus, the lotus, and some others—are of a pure and elegant form, but the general character of Egyptian architecture is remarkable rather for solidity than beauty; and though the Egyptians deserve credit for being the first to lay down the principle of variety in the juxtaposition of columns with different capitals, and in avoiding the monotony of repetition of form and ornament throughout a building, we can neither imitate their columns, the style of their buildings, nor the character of their sculpture.

The Entasis of Greek Columns.

F. C. Penrose.

The entasis of the columns is the most wonderful and beautiful of all the curves. It is so delicate that its existence was for some time doubted; and yet I found it by careful measurements, in a manner which was suggested to me by Professor Willis, which I will here describe. A fine harp wire was strained from the top to the bottom as tight as it would bear, close to the edge of such flutes as preserved a sufficient number of points with the original surface, and by means of a rule with a vernier I was enabled to measure from the flute to the wire with the greatest accuracy to about half one-thousandth foot. I took such measures in several columns of the Parthenon, which I found to be wonderfully true and identical. I measured also the entasis of columns from the Erechtheum, Propylæa (both orders), temple of Theseus, and Jupiter Olympus. In those of the Parthenon, Erechtheum, and Propylæa I find the correspondence with hyperbolic arcs which I have calculated so exact, that the mean of from fourteen to twenty measurements in each column differs from the calculated curve less than one-thousandth foot, and none of them, where the surface was to be depended upon, differs by so much as one five-hundredth. The entasis of Jupiter Olympus gives also a very true hyperbolic arc. The columns of Theseus are so much worn in their outer edges that I was obliged to content myself with measures within the flutes, which never give such regular curves as the fillets, although the flutes are worked with a nicety far exceeding that found in any other style of architecture. Still, a mean from four different sections within the flutes gives a very accurate hyperbolic arc, although no one is a perfectly regular curve. These hyperbolas are all chosen with their axes, multiples, or aliquot parts of the attic foot. The Greek architects acted with great judgment and knowledge of the nature of the curve they were employing, as it is the only one of the conic sections which can produce variety in such delicate curvature as they have chosen for their entasis.

Gothic Capitals.

F. A. Paley.

Gothic capitals may be divided into two kinds, moulded and floriated. The upper member or abacus is common to both, and is the relic of the rude impost which first surmounted the stone post, from which it was transferred through the medium of the Classic to the Christian styles. This seems, in fact, to be the primary and essential, and, as it were, *practical* member, the others being only decorative adjuncts. The lowest member, called the *neck* or *astragal*, is also common to both kinds, but in floriated capitals foliage covers the intermediate space, which is otherwise occupied by the overhanging and undercut member called the *bell*, with its accompanying mouldings. In the Transition-Norman and Early English, the foliage, as is well known, is arranged vertically; in the Decorated it twines horizontally, or rather transversely, round the capital. In Perpendicular, floriated capitals are particularly rare; more frequently small leaves, or *paterœ*, are set like studs at intervals round the shaft above the neck, as in Great St. Mary's Church, Cambridge. But the vine and the strawberry leaf is sometimes seen, very differently worked, however, from the deep overhanging foliage of the earlier styles, being only a shallow kind of surface ornament.

Architecture and Craftsmanship.

R. Thissen.

If art is to have a great future it will be necessary that in its highest manifestations it does not keep aloof from contact with trade and workmen, and that all branches of art be combined again on the basis of architecture, as has been the case in all great and productive periods. From thence they sprang, and thither they will have to revert. By the separation of art from the artisan it has lost the solid basis of the people's sympathies, and it has almost sunk to be a toy for the amusement of the rich. The trades from the same cause became tributary to manufacture, by which they have descended to mere mechanism, which cannot compete to any advantage with the machine-powers of the capitalist. Art has again to proclaim the people to the people, and to become the life of their life. The necessity for architecture to combine with sculpture is evident from a comparison between the monuments with which public places and markets were adorned in the Middle Ages, and our modern monuments. While formerly art-wrought fountains and huge pyramidal cathedral steeples were erected—where, amidst the beauteous foliage of Gothic art, or on projecting pedestals, historical or allegorical figures were placed, which corresponded to every thought and feeling—the monuments of the present time are all manufactured after the same pattern, and are only remarkable for monotony, poverty, and want of character. The people cannot help being indifferent to them. Look at the hundreds of monuments erected to princes, statesmen, generals, and other celebrities throughout Germany. In all we observe the same poverty of idea and form. Although most of them are supposed to be derived from antique forms, they are neither Greek nor German, neither Heathen nor Christian. They belong neither to the past nor to the present, and have none of those qualities which are worth transmitting to futurity.

Expansion of Concrete.

G. Robertson.

Some experiments on the expansion of concrete proved to me that it varies a little with the season of the year. In hot summer weather the expansion of a cubic foot in twenty-four hours after mixing was as much as one-thirtieth of its bulk, usually one thirty-second; but in frosty weather it rarely exceeded one forty-eighth. The force exerted in the expansion was always sufficient to burst the box in which the concrete had been deposited; the amount might even be measured by the distance the nails were drawn out. Whenever the expansion exceeded one-thirtieth of the bulk I considered the concrete too rich in lime, and that there was more than would, when slaked, fill up the interstices of the sand and flints, and coat each grain with a thin pellicle of lime. More than this is not required, for too thick a coating of lime causes weakness, and not strength.

NOTES AND COMMENTS.

The *envois* of the students of the Villa Medici in Rome are on view in the Ecole des Beaux-Arts. Among the paintings, most interest is excited by the picture by M. Fournier, *The Last Chant of Velleda*. The prophetess who incited the rebellion of the Bataves against their Roman conquerors in A.D. 70 is seen surrounded by prisoners from Gaul in a dungeon of the Mamertine, and is encouraging them to die bravely. With upraised arm she invokes the vengeance of the Gods on their oppressors. Velleda did for a time aid the Romans when she found they were too powerful for her countrymen, but she was afterwards brought to Rome and exhibited in a procession. She serves well as a model Frenchwoman in the present state of affairs. M. Puech's plaster figure of the *Seine*—a shapely model in relief—deserves to be commissioned by the city authorities. M. Deglane has a fine restoration of the Palatine Palace. There are the usual number of copies from existing works in Rome.

The new picture and sculpture galleries of the Luxembourg having been re-arranged, the Parisians can now enjoy one of the most delightful galleries in Europe. In London if a stranger has a wish to see typical specimens of modern English art where is he to go? In Paris a stranger need only visit the Luxembourg, and there he can see what is best in contemporary painting and sculpture. It is not only a kind of guarantee of immortality that is acquired by an artist when his work is selected to adorn the Museum, the market value of his future works is also enhanced. Painters and sculptors are therefore willing to sacrifice a good deal in order to acquire the distinction. The prices paid by the Municipality of Paris for works are known, but what the French Government pays is kept secret. The reason is that the announcement would not serve the artists. Two cases have been made known. The *Decadence of the Romans*, by Couture, which is generally considered to be the noblest picture in the Gallery, was bought for less than 500*l.*, although it is full of figures nearly life-size. The little picture of *The Battle of Solferino* was sold by M. Meissonier for 1,000*l.*, which was hardly one-fourth its market value. If it were necessary to dispose of the contents of the galleries—which it is to be hoped may never be the case—it would be found that there was no investment of the French Government which could equal that of modern paintings. Since 1818, when purchases of that kind were approved, the total expenditure has been about 136,000*l.* For that sum all the provincial museums of France have been enriched with more or less paintings, and many have been added to the Louvre. But there is not a picture-dealer who would not gladly give more than the original outlay for those pictures alone which are retained in the Luxembourg.

The commemoration of Domesday will commence on Monday, the 25th inst., and last until the following Friday. On the first day, at 3 P.M., the committee and those who take part in the proceedings will pay a preliminary visit to the Public Record Office, in Fetter Lane, when the Domesday Book and MSS. relating to it will be exhibited by the authorities in whose custody they are preserved, and a paper on the book will be read by Mr. Hubert Hall, F.R.Hist.S. At 8 o'clock the same evening there will be read a popular lecture on the same subject by Canon Isaac Taylor, M.A., LL.D., at the rooms of the Society of Arts, in John Street, Adelphi. This lecture will be open to the public without charge. On Tuesday, at 3 P.M., a similar visit will be paid to the British Museum, when the MSS. relating to Domesday Book deposited there will be exhibited by the head of the Manuscript Department; and at 8 P.M. in the evening, either Mr. Charles I. Elton, M.P., Q.C., F.S.A., or some other member, will read a paper in the hall of Lincoln's Inn, the use of which has been kindly granted by the Benchers. On Wednesday there will be another gathering in Lincoln's Inn hall, at 4.30 P.M., when papers on Domesday land measures, &c., will be read by Canon Isaac Taylor and Mr. J. Horace Round, M.A. On Thursday the friends of the celebration will meet again in Lincoln's Inn hall, at 4.30 P.M., when Mr. J. Horace Round will read a paper on "The Danegeld and Finance of Domesday;" and Mr. Walter de Gray Birch, F.S.A., of the British Museum, will read another paper on "The Materials now Available for Re-editing Domesday Book." On Friday, at 4.30 P.M., the final meeting will take place in Lincoln's Inn hall, when sundry papers on local and topographical subjects will be read by Sir Henry Barkly, K.C.B., and by Messrs. H. E. Malden, M.A., and Frederick E. Sawyer, F.S.A.

Water-colour painting is less popular in France than in England. One of the few of the artists who have been fortunate in gaining a high position is Madame Madeline Lemaire. A flower piece from her hand is necessary in every collection that is supposed to be representative of modern French art. Madame Lemaire, as becomes an artist who is successful, lives near the Parc Monceau, and a few days since her house was the scene of a crime that must be classed among the mysteries of Paris. During the absence of the lady in the country the house was entered. Whether it was for the purpose of carrying away some of the valuable objects remains uncertain. What the police did observe was that nearly all the articles in the rooms were broken or defaced, and that the house was on fire, spirits having been introduced into each of the rooms for that purpose. It is hardly necessary to say that the house contained much pottery, enamels, and *bric-à-brac* of many kinds. That thieves should wantonly destroy the things they were unable to carry off does not tally with experience, and it is possible the criminals may have belonged to a different class. It is rather remarkable that the only room which escaped was the artist's atelier.

The Town Council of Northampton have narrowly escaped the performance of an act that might be called liberal. The Town Hall needs enlargement, and a plan is necessary to show how the space can be utilised for a new or enlarged council chamber, offices for the town clerk, including a new or enlarged fireproof room, offices for the water department, police station, additional committee-rooms, galleries to increase the accommodation in the large hall, improved accommodation for fire engines. In a generous mood, the Town Hall, Fire Engine, and General Purposes committee proposed to ask the local architects to compete, on the condition that the author of the best plan should have the carrying out of the work, the author of the second best receiving 20*l.*, and the remaining townsmen 10*l.* each. But one member when he heard the proposal remarked that some of the 10*l.* plans might not be worth twopence. With that view others agreed, and the subject was accordingly postponed. It is not complimentary to the Northampton architects to estimate their designs at so low a figure, but town councillors have a lofty idea of what architecture should be.

The hill of Montmartre continues to excite apprehension among the inhabitants of the streets around its base. In spite of the number of schools, science has not made its way among all classes, and it is generally believed that the mass of masonry in the new church is forcing the hill outwards. In order to make assurance doubly sure, the authorities have ordered the construction of a retaining wall of a size that will give confidence to the most timid people. At present twenty-four wells are being excavated on the eastern side of the hill. They will be filled with béton, which will serve as a foundation for massive piers, that will be connected by vaulting. But all this work takes time, and little will be visible before the end of the year. The houses are not of much value in the district, and the majority of them have a tumble-down appearance that is not suggestive of construction that will be able to sustain a movement of earth. The streets incline with much rapidity, and there is a flight of steps leading from one street that is almost as good a test of strength as a turn in the Alps. When the new church is completed there will be a strange contrast between its solidity and the ramshackle tenements that are around. The district is so remote from the centres of Paris life, it is difficult to suppose a time when a speculative builder will secure the ground to erect a better class of houses.

ILLUSTRATIONS.

COMMERCE AND NAVIGATION.

THE two decorative figures we give this week are taken from the cartoons prepared by M. Ehrmann for the French section of the Amsterdam Exhibition. They are too important in character to be passed over without being placed on record. They have the characteristics of M. Ehrmann's work—vigorous drawing, a happy arrangement for filling space, and an ideal character that approaches the sculpturesque.

THE PUBLIC HALL, BECKENHAM.

THIS illustration is taken from a drawing exhibited this year at the Royal Academy, by the architect, Mr. George Vigers, 4 Frederick Place, Old Jewry.

NOS. 29 & 30.—CHALICES FROM THE MUSEUM, PERUGIA.

OPEN-AIR LANDSCAPE PAINTING.

A WRITER in the *Nottingham Guardian* having stated that a landscape by Mr. Andrew McCallum was an aggressive picture, the painter has given the following explanation of his method :—

After a long and varied experience I am convinced that it is not for a painter to argue with his critics. It is for him to paint and for them to criticise. I am little used to the pen, and my works must speak and plead for me. However, the very kindly and discerning critic in your impression of the 17th ult. speaks of my *Golden October* painting as "an aggressive picture." Indeed, it is so. It seems very aggressive to me, and it must to a still greater degree seem so to the public, who do not, like myself, spend their days in woods and forests, striving to "catch Nature round a corner," and endeavouring with all my powers of mind and body to place upon canvas her fleeting humours and beauties. I know—how well I know!—after thirty years' incessant labour, labour alike of soul and body, how impossible it is to give a worthy rendering of that which is impossible to the finite mind; but I leave my works to speak for me, how I have to that end given all the powers with which I have been endowed. The landscape-painter must be a student from his cradle to his grave, and to the youth of my native town of Nottingham I leave my reputation as a faithful and diligent student of Nature. To them I explain how, in my endeavour to make pictorial art in landscape a power, I came to paint such an "aggressive picture" as *Golden October*. A work I also exhibit on the walls of your Castle Museum is, perhaps, of all other pictures in that splendid collection, the most antagonistic to it in point of treatment. I have no preferences or prejudices. Nature to me is a mistress, a most imperious one, whom I am bound to serve without argument, and in this instance I followed her without question. A many years' study, I might say truly, life work, in forest and autumnal scenes, had taught me that there was one effect that I had not yet secured, nor had any one secured it on canvas, and that one, indeed, the most glorious of the year. There is a moment when the evanescent hues of autumn have reached their deepest and most gorgeous colouring, when nature seems, as it were, to exhaust her dying energies in one blush of loveliness, that if not transferred to canvas in a few hours, will not be transferred at all. Many a time I have marked my subject and have mentally noted down every particular, and have mixed every tint of colour, and have made every arrangement for starting work early on the morrow; when the frosty night has loosened the leaves, and they have fallen off in showers at my feet at the first touch of the golden sunshine; or the blast has come and swept the leaves away, leaving only dark and wintry boughs. Thus I was tempted, nay, well nigh driven, to adopt the quickest method of accomplishing that I had in view.

I challenge any painter to draw the foreshortened leaves of the flaming beech with the brush, those smooth glistening surfaces catching the sunlight, and where it can be seen through the leaves, giving a colour that no paint can equal in brightness. Then the grey-reflected light on the mirror-like surface, their sharp edges and sharper points coming towards you, no dull hog hair-brush or brighter sable can touch. It must be done with the knife. One momentary flick of rightly mixed colour, rightly and knowingly laid on, and the effect is gained at "once and for ever." I am afraid to speak of the exaltation of mind the lover of nature feels in presence of such a scene as I am imagining. The absorbing passion for painting such an autumn picture, in the actual presence of Nature, of course, is for the moment a kind of madness, a joy not to be told in words. Nor must we forget the deep dark shadows full of transparency and of tender form, discerned but dimly, but needing portrayal; and over and across them the gold beech boughs waving and dancing, flinging cross lights and shadows over the ground, must find a place in any true picture. The picture is before me, and I regard my lovely subject with reverent eyes; and fixing on its strongest part, with one sweep I lay in my darkest tones, surrounding them with half tints of thicker colour, and always careful not to destroy their breadth. Thus I get it ready for the glorious branch that seems as though it were on fire before my eyes. The local colouring of ruddy life, or some streak of golden sunlight on a dying bough, must be dashed in, and in it goes, rapidly, fully, and freely—here putting on the sharp shadows on the neighbouring leaves, and there touching the half-tints with grey, and flicking on the highest lights in almost as short a time as it takes to write it. There, too, stands the plumy and shining bracken defying translation almost. What joy is there like the feeling of mastery over one's materials? We are engaged in a race and struggle against time, and the brush means defeat. The good knife leaps lovingly up the stalks to their tips, and runs down the frond, dallies a moment with the drooping tips, and in a moment charms everything into its proper place and shape, and the knife has done in a minute what the brush could not do in a day. The boles of the trees, if small and thin, we treat in the selfsame way, and lay with loving finger into the wet, full, dark, and absorbing ground, the mosses and lichens on the delicate birch. If it be a beech in shadow it needs a low-toned treatment in much smoother colour; but if it be a mighty oak in the foreground, we model it with the knife in white, and let it take weeks to dry and harden; but when complete it is delicious to paint upon, and strong and pure and lasting. Such impasto is imperishable, and if walked upon would take no more harm than an oilcloth for the floor.

This pursuit of truth in Nature has been and is a life's passion with me. It is my highest joy to effect something that all people can read and understand. I am afraid, however, my work appeals to those who have most knowledge of the subjects I depict, and can appreciate the life work there is in it. Nature, to be won, must be boldly won. In the rigours of winter she must yet be sought face to face; in the mists and blasts of autumn she must be pursued; and amidst the deluge of spring and the sweltering heat of summer, the artist who means to conquer must throw pleasure behind him and prepare for a life of severe toil. His joy must be in the work he achieves. I know there is a kind of landscape art that is begotten of a sketch and born in a studio; but this is not the kind of art I have pursued or shall pursue. Steady, calm, and resolute work, face to face with the object depicted, is what I reckon to be the only true method of interpreting Nature, and the only one I can follow.

I fully admit *Golden October* is an exception to the ordinary rules of landscape art; and my only apology for it is its truth. To make the landscape a living reality, as far as it is possible for it to be made a reality by means of oil painting, has been my object, and I am ready to stand the fire of criticism. I take the prime object of landscape painting to be a bringing some touch or aspect of Nature into our homes and galleries. Rules are only valuable when they conduce to this end, and when previously formed rules are impossible to effect it, it is plainly the call of the painter to think for himself, and make a new rule if necessary. The knife is no new instrument. Rembrandt wielded it with magical effect, and the flat impasto of the great artists of the Renaissance had a further development in their nimbi about the crown of the Virgin, and in the arrangement of ornament. I have applied it in this instance to the leaf and the blade, and to the rugged oak. An intense study of Nature, pursued under almost every condition of sky and climates—in the valley of the Nile, and amidst the scenery of Greece and Italy and France—has proved to me that mere flat painting is purposeless to reveal the effect of intense sunlight. Why should not the painter inherit some of the powers of the sculptor and modeller? Shall Nature make the rule, or shall the rule make Nature? As an humble student of Nature I have thrown in my lot with her. She tells me the plan I have pursued is the one of truth and faithful interpretation; and as in the picture of snow and ice I have found that it demands perfect flatness and softness to render it truthfully, so I have found that to portray such a scene as that of *Golden October*, it demands a method exactly the reverse.

I end this letter as I began by saying that I know that I am in error in attempting to reply even to favourable criticism; but having given my life to the pursuit of truth in Nature as a landscape painter, and having had the good fortune to find purchasers of my works in those whose knowledge and culture have made them the best judges of my efforts to attain it, I feel that I am but giving back a little to those art workers in the good old town of Nottingham, wherein I first drew breath and first felt the command laid upon me to work for the glory of true art, by telling them how, at a late period in my career, I

felt a new command to accomplish the portrayal of one aspect of ever beautiful and changeful Nature, by an unaccustomed, though not new, method of interpretation of her beauties. I ask them to give me this one point of credence, that I could not and would not have departed from accepted rules and traditions, had not a life's effort to accomplish this one aspect of Nature faithfully proved to me that other methods than those I have followed were impossible. There are and may be rules consecrated by tradition, and accepted by the schools, for other branches of the art of painting; but the landscape painter is always a rule to himself. The more humbly and the more heartily he strives to approach the pictorial representation of the beauties, the terrors, and the sublimities which Providence presents to his vision, the more nearly will he approach to the high ideal of his calling as a maker and teacher of men. And it is in the hope that this one picture will be a cause of thought to others of a younger generation, that I have dared to exhibit it upon the walls of the Castle Museum. Its approval or condemnation are equally acceptable to me. I have fought my fight almost with Nature. I have pursued her only, when to have avoided her were fame and power; but I would not desert her for mere rules and regulations, and this one aspect of her thousand beauties I respectfully submit as the only true and possible one.

INIGO JONES.

THE fourth number of the quarterly magazine, "The Century Guild Hobby Horse," which appears this month, is interesting for illustrations and writing. There are reproductions of a broadsheet by William Blake and of two cartoons for stained glass by Dante Rossetti, who also saw visions. The editor, Mr. Mackmurdo, continues his papers on the National Gallery. The longest essay in the number is by Mr. Herbert P. Horne, and is entitled "A Study of Inigo Jones." The extract will suggest its character as well as that of the magazine and Guild. The Guild "seeks to emphasise the unity of art;" the "Hobby Horse" deals chiefly with "the practical application of art to life."

Though much of Gothic detail and ways of building remained in the early part of King James's reign, mingled with strange distortions of Classic forms, the spirit of Gothic had for ever passed away. The Elizabethans were perpetually striving to regain this departed temper, and recreate the old Gothic under the semblance of Ionic pilasters and egregious arabesques. That was impossible, for Gothic was as much the unconscious expression of the Middle Ages as were the temples of Athens of the ancient Greek souls. Jones instinctively knew this. He knew also that architecture to him must ever be the effort of an individual, not the outcome of an age, and his art must therefore be eminently traditional or Classic. Now the great law of Classic, or traditional architecture, is the predominance of the horizontal over the vertical lines; while that of Gothic, or spontaneous architecture, is the ascendancy of the vertical over the horizontal. For Classic, with its lines stretching over the earth, was the architecture of enjoyment; Gothic, with its spires and thousand pinnacles, the architecture of aspiration. But men—nor was Jones excepted of them—had lost the zest of Mediæval days, and had found that, with all its vices, there was still something in the philosophy of Epicurus that was just and worthy. No example, I think, of his work shows Jones's acceptance of these things more clearly than the church of St. Catherine Cree in Leadenhall Street. The old church where Holbein was buried, and which seemed "to bee a very olde thing, since the building whereof the high streete hath beene so often raysed by pauementes, that now men are faine to descende into the saide church by diuers steppes, seuen in number," was, it is said, pulled down in 1628, and the present church finished in 1630. But there are many things which incline me to place the rebuilding several years earlier, perhaps anterior even to 1613; especially the three circular pediments and the fantastical parapet that originally surmounted the south front, and which were replaced by the present plain parapet between 1733 and 1838. At the same time a square turret, which Jones had designed, and the old Perpendicular windows, were destroyed, and the present bell-cot and belfry windows worked into the Gothic tower of 1504. A plain parapet also, in all parts of the church, took the place of Jones's strange device, of which a mere fragment may yet be traced on the west front, between the tower and the end of the nave. Inigo Jones, in rebuilding this church, though he retains the general arrangement of the Gothic architects, their arcade and clerestory, together with much of their detail, as their vaulting, their cusps, and their mullions, yet nowhere does he violate the Classic spirit, nowhere are the horizontal lines broken, because he felt that his life was not spent in reaching after the aspirations of Mediævalism, but after a new morality, the sensuous disciple of art: therefore thus much he took from the Gothic builders, thus much and no more.

But to turn from the reasons of his perfected work to the work itself. Of this there is, perhaps, no finer example than the Banqueting House at Whitehall, now the Chapel Royal, so long as we remember these two things—that the plinths in the balustrade were to have carried statues, and that the present building is, comparatively speaking, but an insignificant portion of the palace as first planned by Jones, one of the two side blocks, in fact, separated from each other by a central and larger block exceeding them in height by another storey, the three forming together the east side of the great central court, which measured 740 by 378 feet. Of the whole palace, there are the drawings on rollers at Worcester College, probably by Webb, the unsatisfactory plates of Kent, and the still more unsatisfactory series of Colin Campbell, together with some few odd drawings in the Soane Museum and elsewhere. But as all these designs contain errors of taste which any real study of the portion erected would not allow us for a moment to ascribe to Jones, I am inclined to think, with Walpole, that these various plates and drawings are a cento from his sketches, and done from no finished design. Much, however, remains to us of the palace that would have exceeded all palaces, even the Escurial, the building that might have held the Titians, the Mantegnas, the Raphaels, and all the pictures and sculpture of Charles: its front of a thousand feet of columns and statues, its seven courts, chief amongst which was the surprising circular or Persian court, with its many orders and caryatides crowned with a crown of statues. But let us not search too nearly into this unsubstantial fabric; rather let it be

> A wilderness of building, sinking far
> And self-withdrawn into a wondrous depth,

divining it, perchance, in our minds, as at times haply one might dare to call back from the Ivory Gate visions of the tomb of Julius or of the unwritten soul of Keats.

The present Banqueting House was commenced in 1619, six months after the old building had been destroyed by fire, and it was finished within two years, the master mason being Nicholas Stone, the sculptor of the shrouded figure of Donne in the choir of St. Paul's.

From a "base of rustique" rises the first order, which is Ionic, the capitals and entablature of which first tell of the growing richness of the order above, which the architect intended to close magnificently in the statues of the gods standing against the heavens. In the second, or "compound order," an entasis in the columns and pilasters, fuller than that of the lower order, brings additional life into the work and leads the eye up, through the band of ornament in the frieze and capitals, to the pedestals for the statues, each statue repeating a capital beneath it; while the growth of the whole is aided throughout by most subtle relations of proportion both of the chief parts and of the details. The gradually increased richness of this elevation is as organic and reasonable as the growth of a plant whose lines become less restrained until they at length burst into a crown of flowers; and yet, with all its luxuriance, it is as broad and simple as the most Classic of buildings, and the reason is simple, for none of the surfaces are broken, and all the ornament is, theoretically, in shadow.

It is well also to notice the manner in which the capitals have been thought of as masses, and the volutes and leaves as minor masses; and the superb art with which these masses are echoed along the frieze, in the wreaths and masks, exquisitely connecting capital after capital, weaving them into a decorative whole. This band of sculpture has a beauty and fitness akin to the best Florentine work, and equalled by no architectural carving that I know of in London. Certainly it is above all comparison with the florid wreaths that Wren finely placed on his halls and churches.

Here, lastly, as in everything he did, is particularly marked Jones's orthodox use of the Classic orders, the result of his long study of Palladio and Vitruvius.

In contrast to this palace of Whitehall, before we pass on to something more nearly connected with it, let us stop to see how our master treated an ordinary street of houses. The whole of the south side of Great Queen Street, Lincoln's Inn Fields, was originally built from the designs of Jones, tradition says, at the expense of the Jesuits, and was to have formed one side of a square which, like the greater part of his essays in architecture, was never completed; and as the north side was not built until nearly a century later, this tradition may not unreasonably be accepted. Of this series of houses, only two, Nos. 55 and 56, or, what is more probable, one house divided into two, remains. The character of the cut brickwork between the first and second floor windows of No. 55 would seem to date it anterior to his second visit to Italy, and also that form of capital so peculiar to him, and which is presently made perfect at Whitehall, is here exaggerated in a manner suggestive of an early period. But how prodigal of effect is the cornice, broad, delicate, and yet so bold: broad in its treatment, exquisitely delicate in its mouldings, and bold, beyond imitation, in the light and shade thrown by the eaves. With what advantage might the builders of our new London study this little example of our master's art, for this could unerringly show them, if

indeed anything were able, that coarseness is not boldness, neither is meanness delicacy.

Francis Bacon, Lord Verulam, had at length, in 1622, given up York House in the Strand to George Villiers, first Duke of Buckingham. Villiers was assassinated in 1628. It was during this interval of six years that he borrowed the stone collected for the repairs at Old St. Paul's, and employed Jones to design the Water Gate still remaining on the Thames Embankment near Charing Cross, as a first step towards the rebuilding of York House. Campbell says it was erected in 1626, and there is no reason to suppose that this is incorrect. In Hollar's drawing in the Pepysian Library the river surrounds, on the three sides, a plain plinth supporting the gate, which plinth extends in front of the bases of the columns so as to form a platform, from which a broad flight of steps, equal in width to the space between the two outer columns of the river front, leads to the water. We now not only look down upon it, as it stands in a hole away from the river, but the plinth and steps, if they still exist, are completely buried ; so that we see it shorn of its proper height, and deprived of the reason of its existence. The felicity of its proportions has long been praised ; not so its simplicity and the largeness of scale on which it is conceived ; yet the quality which is here most worthy of our study is, I think, the sense of fitness which it reveals.

Of the palace that Jones had hoped to raise behind it, all that a diligent search could discover was a drawing at Oxford for an enriched and panelled ceiling, decorated with gold and blue, and bearing the motto of Buckingham, "FIDEI CORTICVLA CRVX," inscribed on the frieze. There is nothing on the drawing definitely to tell us that it was intended for York House, but as the same motto is cut on the frieze at the back of the water-gate, this seems sufficient ground for the supposition. Dallaway speaks of a painted ceiling like that at Whitehall, though I can find no other mention of such. But this comparatively slight relic is sufficient to show us the palatial character of building to which this grand rugged gate was intended as a foil. Magnificently would the fine sense of texture obtained by the contrast of the severe Tuscan pillars and the strange elongated keystones with the great masses of rusticated work have told against the delicate breadth and richness of a frontispiece, like that of the Banqueting House. Here, too, as at Whitehall, we find his accustomed concentration and reserved use of ornament; the decorative placing of the escallop shells finely preparing the eye for the masterly masses of carved work above. Nor must we forget that the low side walls yet mark the original height of the walls of the garden terrace up to which the river once flowed. In those days who would might have rowed quietly up to the gate, and standing on the steps have seen through its repeated archway John of Bologna's *Cain and Abel* in the garden beyond, and would not have been surprised if, having passed into that enchanted plot, he should have found Francis Bacon walking there.

Yet these are but exterior examples : of his interiors, however, not so large a number have escaped the hand of the last two centuries. Somerset House, Shaftesbury House, Physicians' College, "my lo Matrauers his house at loatsbury," Sir Peter Killigrew's "in y^e^ black fryers," no longer exist; whilst the houses in Lincoln's Inn Fields and Covent Garden have been too frequently patched and altered, especially inside, to give any adequate idea of their first state. But Ashburnham House remains, hemmed in by the cloisters and conventional buildings of the canons of Westminster. Here is the same restraint, the same breadth with boldness, the same simplicity with richness, but altered to the new conditions of light, and coupled with a certain picturesqueness proper to interior effects —a picturesqueness, however, very different from that unreasonable bringing together of what is wholly unlooked for which characterises our modern houses. That is the picturesqueness of fashion which passes, this is the picturesqueness of mind which endures, for throughout the continued change of effect which is seen by ascending its largely planned staircase, everywhere beneath the apparent confusion are the order and repetition which are the first part of architecture. But the relief work with which our master here enchants his ceilings, cornices, and walls, chiefly attracts the eye by its difference from the ornament which our modern architects scatter over their buildings. We have already noticed the felicity of the decoration on the frieze of the Banqueting House at Whitehall. As that for stone, so this for plaster is equally admirable : the design on the broad ribs of the ceiling of the drawing-room is as fine and delicate as Florentine work. The upper wreath of the cupola over the staircase has all the forms and decorative placement of Luca della Robbia's bands of Italian fruits and flowers, while the lower wreath with the same charm of light and shade might have been gathered from our own English gardens. But besides this Italian exquisiteness, they have a strength and directness which is altogether of England, yet without a taint of her vulgarity or her coarseness, and upon the whole is set the seal of the times of Charles I.

There is yet another little work of his, weather worn, mutilated and forgotten, still remaining within a few yards of the busiest part of Tottenham Court Road, which is worthy of a brief notice. In 1634 had died his "ancient poor friend," George Chapman, "silently glanced that, like a thunderbolt, looked to have shook and struck the firmament." He died on May 12, and was buried in the yard on the south side of the church of St. Giles in the Fields, that was presently to hold the ashes of Andrew Marvell. "Soon after," says Anthony a Wood, "was a monument erected over his grave, built after the way of the old Romans by the care and charge of his most beloved friend Inigo Jones; whereon is this engraven, 'Georgius Chapmannus, poeta Homericus, Philosophus verus (etsi Christianus poeta) plusquam celebris, etc.'" The little monument still stands on the south side of the modern church of St. Giles ; but a new slab has been let into it, bearing a different inscription from that which Wood gives.

St. Paul's, Covent Garden, though commenced in 1631, was not finished till 1638, being consecrated by Juxon on September 27 in that year. It seems to have been the last of his works, certainly the last of any importance.

THE PRESERVATION OF OUR RUINED BUILDINGS.

A LETTER appeared in the *Times* of Wednesday from Mr. E. P. Loftus Brock, F.S.A., honorary secretary of the British Archæological Association, on the subject of restoration, in which he says :—

The discussion which was begun by Canon Venables in your columns, having for its subject a title very similar to that which forms the heading of this letter, seems likely to be continued merely as a subject of difference of procedure relative to one important building, and no more.

I think that this is matter for regret, since it is likely to divert attention from what is a large subject, one that has great need of consideration, and which must receive attention before many more years pass away, namely, the care and protection of the ancient ruined buildings of our land. Most of your readers are now returning from vacation, during which not a little of the most pleasurable and instructive of these times of rest have been devoted to what is becoming year by year a special feature of such times—visits to all the ruined buildings in the various localities of their temporary residence. They probably have, therefore, many varied experiences of continuous decay, want of care, necessity for speedy attention, and many such ; all of which would indicate the pressing need of more notice being taken of the whole subject and of the benefit of its discussion. With your permission, therefore, I venture to make some observations and some few practical suggestions in the hope that, attention being given more generally to our ruins, these valuable records of the past may be handed down to future generations in as good a condition as the state of the case admits.

These ruins are no longer objects of indifference as they were a generation or two ago. On the contrary, they are of extreme interest on the part of the community at large, and were it possible to publish statistics of the number of visits paid to them it would clearly show the great amount of regard which is evinced by the people at large in their inspection. The number of visitors at Netley, Fountains, Tintern, and Valle Crucis Abbeys, and many others which are doubtless well known to a goodly number of your readers, are illustrations in point. In many of these cases a charge is made for admission, and the income thus obtained is sufficient to pay for the presence of a caretaker and for purposes of repair. Here is at once a suggestion which may at once be acted upon by any proprietor, who in these hard times of agricultural depression may well be concerned at the suggestion that it is his duty, as the owner of property of interest to all, to incur now an outlay in upholding his ruin lest it should become lost to posterity. In almost every case the attractive nature of the ruin might be made more so by excavation, to reveal the portions that may be buried beneath the accumulated earth of centuries. Still, it is only in certain positions and under certain circumstances that an owner can make his ruin be self-supporting. That there are very many cases in which it may, may be readily conceded ; and I make the above remarks in the hope that more owners will adventure it. Still, there are a great number of cases where the modest sum charged for inspection is altogether inadequate to meet the needs of the case. An unfortunate instance exists at Bignor, Sussex, where some of the very finest Roman pavements are gradually perishing for want of a little more outlay for covering. I can bear abundant witness of the great interest taken by the farmer owning the site, and also by the pressing need of the work. If this is so where interest is actually shown, what can be expected when no interest exists on the part of the present owner, and when no income is derived? Visitors may come, to the annoyance and disturbance, more or less, of the owner, and visitors may go ; but how is the ruin to be upheld? And if not upheld by this genera-

tion, can it be expected to be handed down to posterity except in a lessened degree? It is seldom, however, that no interest exists, for homely and illiterate as the owner or tenant may be, yet it is often matter of pleasurable gratification to witness the interest taken in the "old, ancient place;" but no money is at hand to arrest decay. The same remark applies with respect to many corporate bodies, whose funds are devoted to specific purposes which may with difficulty be applied to the upholding of ancient works of art.

Little Leighs Priory is owned by a London hospital. Its brick chimneys, loosened for want of pointing for many a year, will come down with a run before very long. Lawhaden Castle is owned by an Ecclesiastical Commission. It is a mass of tangled undergrowth, and sadly needs attention. These are but two examples which come to my mind, neither better nor worse than others, but they are typical ones out of a very long list that could be swelled to any extent. I refer to them, not in any spirit of fault-finding—although, perhaps, in such cases the owners ought to spend a little money in taking care of their property—but only to indicate the state of things that exists with a view to a remedy.

My experience of owners when they have been possessed of means is, however, far from discouraging, rather the reverse; and on behalf of the British Archæological Association I have had not infrequently to make friendly suggestions which have been acted upon. Thus, for instance, we found during our congress at Tenby that Carew Castle was in considerable danger from the usual causes—want of attention to the loose portions of the masonry, the inroads of frost, &c. Representation was made to the present descendant of the ancient owners, who cordially responded, and the castle is now safe, Mr. Cobb, whose careful works uphold his own castles at Pembroke and Manorbeer, kindly undertaking the oversight. Our works in this respect are doubtless no more, if no less, than those of other antiquarian societies, and I refer to this particular instance, not only because it is a very fair example of the mode in which such works should be carried out, but also to indicate what may be done in obtaining practical and permanent results from such meetings as that to which I have referred. Still I think that antiquarian societies may, all of them, turn their meetings to better account if such objects as this, the preservation of antiquities when in want of attention, are kept in mind.

The promoters of such meetings are then almost always in friendly correspondence with the owners, and a few words of advice spoken with tact and judgment may not be taken as offensive, or as from busybodies, and will get listened to at some convenient season.

While I gratefully admit that individual effort on the part of owners is doing much in this present time, whereas formerly it hardly did anything, while it can yet do much more as it becomes interested either through public opinion or any other cause, yet it will but touch a certain number of our ancient monuments. It may exist for a lifetime, and may not exist when pressing need arises. It will not and cannot be expected to be steady and continuous, while the requirements of the buildings are just those that need such attention.

I have now made some suggestions relative to individual works on the part of the proprietors, but that which concerns the whole of our ancient buildings is a far larger matter. It is that they should all be put under the care of the nation through its Government, and that the cost should be borne by the nation. That the latter proposition is but just will, I hope, be readily assented to, for it is the nation that would benefit by the due preservation of its national antiquities, which would thus be handed down as intact as possible to generations yet to come. The subject, pressing as it is, is, however, far too large to be dealt with, with any chance of success, so far as the case of every individual antiquity is concerned, and private owners must go on ruthlessly to demolish their property, as has been the case within the last week or two at Colchester, where a fine Norman building has been in the hands of the destroyers. There is, however, a step towards it that may be taken to meet many cases. The machinery is actually in existence. The Ancient Monuments Bill, 1882, one of the wisest Acts that have ever been framed, provides briefly as follows:—The owner of any ancient monument to which the Act applies may constitute the Commissioners of Works the guardians of such monument. The owner shall, save as is provided in the Act, have the same estate and right as if the Commissioners had not the guardianship. The Commissioners to undertake the work and the cost of maintenance. Her Majesty may from time to time, by order in Council, declare any monument of like character to those in the schedule to be deemed an ancient monument.

Now these provisions unfortunately at present only relate to one class of monuments known as prehistoric, and only a certain number of them, which are scheduled in the Bill. They may be made, however, as applicable to a ruined castle or monastery, a Roman villa, or a Saxon earthwork. It but requires an addition to the Bill to include all the other classes, and the Act becomes a part of the law of the land.

It will be noted that the Bill's action is purely voluntary, and so it had better remain. Even when an ancient monument is taken over, it does not cease to be private property. Now, if the Act be altered, and if in addition an easy process for increasing the monuments scheduled be framed, any owner could then place the monument, whatever its nature, under the care of the Act. It would then be safe for all time, and the cost of upholding would be spared to the owner. As the Act now stands, an owner may offer a standing stone or an ancient British pit dwelling, but if an owner be desirous of offering a Norman keep or a ruined abbey the offer could not be listened to.

This suggestion will help to meet many cases if carried out, and carried out, I venture to predict, it will be. Still it will only meet certain out of many classes of cases. There is another of which Canon Venables's letter stands as a permanent reminder. Kirkstall Abbey is a huge ruined and roofless church subject to the gales of every season and the frosts of every winter. The great mass of its tower fell many years ago, doubtless then for want of attention, as did the tower of Whitby Abbey more recently. The remainder, thus deprived of its abutment, still stands. Is it likely that it can stand permanently? There are also other parts of the fabric in need of repair. On this account I hope it is made hard for any modern maid of the mill to seek the interior during a stormy night, or she will run some chance of losing more than her senses, as did her prototype. Now this abbey is of a class of ruin too large, in almost every case, to be kept standing by individual ownership. Why are they not acquired by some corporate body and surrounded by a people's park? The spirited and far-seeing action of the Rochester Corporation in obtaining Rochester Castle, that of Nottingham in securing the Castle, and that of Birmingham in acquiring Aston Hall, are all cases in point. The buildings are in security, the localities derive not only the benefit for the townspeople on the spot, but strangers are naturally attracted to these localities to inspect.

With regard to ruins generally, it will really be found that the actual need of many ruins is not that of large outlay. Continuous care and very moderate expenditure are often more desirable. I need not add much to Canon Venables's specification, except to urge more than he has done the importance of careful pointing to the walls to exclude wet as often the most pressing work to be done, the pulling out of roots where likely to spread unduly, and the exclusion of wet from the tops of walls and any vaults with gas tar. This is better than cement, for it does not so readily crack or scale off if laid on where the walls are dry and vegetation is removed from all places where it would do mischief. I do not advocate that our ruins should be made unpicturesque—far from it—but only the doing of such works as are most pressing to avoid decay. Much ivy may remain if judgment be used. Some weak walls are pulled to pieces by ivy, but if left to themselves they would suffer the like fate from frost; but if ivy cover them they may stand a chance of avoiding the former. Ivy will not penetrate a solid wall, nor will it one that is fairly well pointed. Whether, therefore, to strip, to point, or let the ivy cover the weak wall must be a matter of individual judgment on the spot.

THE BIRMINGHAM SCHOOL BOARD.

At the last meeting of the Birmingham School Board the Sites and Buildings Committee reported that each of the five architects invited by the Board to send in competitive plans for the schools to be erected in the Soho Road had complied with the invitation, and had submitted designs. The committee had carefully examined these plans, and found generally that they fulfilled the conditions which had been issued. The names of the competing architects were not attached to any of the drawings, but each sheet was marked with a word or motto. The seals of the envelopes which contained the names of the architects had not been broken, and the committee were of opinion that the set of plans marked "Slow Steps Upward" was the best sent in, and recommended that these plans be accepted, subject to the approval of the Education Department. The committee also reported that negotiations had been entered into with the owners of the land in Inkermann Street, Vauxhall, and recommended that an area of 4,300 square yards of land, having frontages of about 45 yards to Inkermann Street and 46 yards to Alma Crescent be purchased, at a price of 1,827*l.* 10*s.* and costs, being at the rate of 8*s.* 6*d.* per square yard.

Mr. Kenrick, in moving the adoption of the committee's recommendation with reference to plans of the Soho Road School, said that the committee had been saved a good deal of trouble in superintending the competition by having a list of regulations for the erection of schools passed by the Board some time ago. The committee, however, gave certain other instructions, one of which related to a matter that had lately excited considerable attention, and in which the committee had taken a line that would free them of the censure passed in the

case of another building. The buildings were to be constructed either in red or in other brick, and terra-cotta or stone might be introduced in the elevation. In the event of the lowest tender upon the accepted plans being higher than 10*l.* a head, the Board would not be bound to accept the plans. All the competing architects had done their utmost to produce a building thoroughly efficient in internal arrangement and handsome in external appearance, and the committee had been very much pleased with the competition. There was more than one plan which merited very high commendation. He thought, moreover, that all the members of the Board would be better satisfied now that a competition had been held. He did not mean to say that the Board would be thereby induced to pursue the system further. When the schools were up they would know more about the results of competition. The plans, in the opinion of the committee, were of course the best; but it must be understood that many things might happen before the schools were erected, and he would not go so far as to say that schools erected by one of the other architects might not turn out as well, for the committee had had only the plans before them, not having taken professional opinion, and having been guided solely by their own knowledge and experience.

The Rev. E. F. M. MacCarthy seconded the motion, and was especially glad to do so, because the accepted plans had approved themselves primarily on educational grounds. It was enormously important in the erection of the schools—important in a way which teachers only knew—that the arrangements in even the minutest details should be of the best possible kind. The author of the plans seemed to have had a finer educational instinct than his competitors. Every classroom had its own exit to the playground without passing through the central hall, an arrangement which enabled the children to get the full benefit of the play-time, and also to assemble and disperse quickly.

The motion was agreed to, and the Chairman, on breaking the seal of the envelope, read out the name of the successful firm of architects as Messrs. Thomason & Whitwell, Cannon Street, Birmingham.

Several members asking that the other envelopes should be opened, the Chairman pointed out that these might be needed in case the contractor's lowest tender was at the rate of more than 10*l.* a head.

USK CHURCH, MONMOUTHSHIRE.

By S. W. Williams, F.R.I.B.A.

THE priory church of St. Mary at Usk illustrates the growth of some of our larger parish churches, from the original Norman building of moderate size down to the end of the Perpendicular period, when it probably attained its largest dimensions before the dissolution of the monasteries in the time of Henry VIII.

This priory of Benedictine nuns was founded by Earl Richard de Clare, the well-known Strongbow, Earl of Pembroke and Lord of Striguil, whose uncle, Walter de Clare, was the founder of Tintern Abbey; and it appears, from an entry in the valuation of its revenues made at the time of the dissolu- of the priory, about 1535, that one pound was to be expended annually "upon Sherethursday in almes to pray for the founders, viz., Sir Richard de Clare, Sir Gilbert his son, Earles of the Marches," and for other descendants and benefactors.

The date of the foundation of the priory can, therefore, be fixed approximately about the early part of the twelfth century, say 1135 or thereabouts. The architecture of the original Norman church, of which there are still considerable remains, most certainly dates from a much earlier period; and I think the cruciform church may have been built about the middle of the eleventh century, or at any rate soon after the Norman Conquest. Of the early Norman church there remain the south wall of the nave, with its massive south-western buttress of early type, which distinctly marks the length of the original nave, a portion of the west wall of the north transept, and the very fine central tower carried upon four massive piers, with its circular angle stair-turret approached from the north transept. Externally can be traced the water-tables of the roofs of the choir, north and south transepts.

The groining over what is now the chancel, in the interior of the tower, is carried upon angle corbels, and is of distinctly early Norman type. The tower itself is built in three stages, and is, I believe, of the same period as the nave and transepts to the top of the corbel-table; the battlements are modern.

I am of opinion that the early cruciform Norman church was the original parish church of Usk; that upon the founding of the priory by Earl Richard about 1135, considerable additions were then made, so as to accommodate the parishioners as well as the conventual establishment; the north aisle was also built at that period for use as a parish church, and the original Norman nave was lengthened about 10 feet or so, as shown on a plan by the dotted lines and lighter shading, indicating Early English or Transitional Norman work.

On the plan which is now in the church, showing the alterations made in 1844, a buttress is shown, which appears to have been taken down when the nave was further lengthened at that time, and which, I think, marks the limit of the west wall of the nave before the latest alterations were made. This buttress is in line with the west wall of the north aisle. It will be seen that the arcade is of the same period as the north aisle, and that when it was built the north and west walls of the early Norman church were taken down; but, doubtless, the transepts and choir were retained; the east wall of the north aisle was at the same period pierced for a doorway giving access to the north transept, which then, as now, was probably used as a vestry. At the same time, I believe, the doorway now blocked up in the south wall of the nave was opened, to give access from the church to the conventual buildings and cloisters; in the original Norman church the entrance would be by a west doorway, probably of very rich design, as at Chepstow Church. The arcade, which is of Transitional Norman, or very Early English type, consists of four obtusely pointed arches, carried on circular piers and responds, with moulded caps and plain splayed bases.

The pillar that is the first from the east end is different from the others in having four slender attached shafts, and I think that this difference was intended to mark the line of the chancel of the parish church, and that probably the door at the north-eastern angle of the aisle was the priests' door. If we assume that a screen extended the entire length of the arcade, it will be seen that the north aisle then becomes a separate church for the parishioners of Usk, as was the case at Leominster Priory Church.

The next important addition made was in the Perpendicular period; and from the character of the work I think the additions of this period, which consist of the north and west porches, the insertion of three windows in the north wall and the same number in the south wall, were probably made about the latter end of the fifteenth century, and are of a type common in this district. It appears to me that this was about the time when the later alterations were made, a period of great church restoration throughout Monmouthshire and part of Glamorganshire, and that the work was done by the same men who built the beautiful Perpendicular churches of Somersetshire.

The later additions and windows introduced in 1844 are, unfortunately, but inferior copies in point of detail of the older and much richer Perpendicular work, and this is especially noticeable in the tracery of the new west window. It seems unfortunate that the builders in 1844 were unable to restore and rebuild the transepts and choir, instead of lengthening the nave westwards, which has destroyed the original proportions of this fine old church; and it is to be hoped that if any further enlargement or restoration be attempted that it should in that case result in rebuilding the choir and transepts.

No doubt excavations in the Priory grounds would lay bare the original foundations of the missing portions of the early Norman church.

WIRE NETTING.

A COMPANY has been formed to purchase the patent rights and privileges, &c., &c., of Messrs. W. F. Dennis & Co. for an improved system of manufacturing hexagonal wire netting, under the name of the Dennis Patent Continuous Wire Netting Company, Limited. Mr. Latimer Clark, C.E., who is so well known as a man of practical experience, has pronounced most favourably on this system. Speaking of the very ingenious wire-netting machine invented and patented by Mr. W. F. Dennis, he says Mr. Dennis has made an entirely new departure in this branch of manufacture, which enables him to produce wire netting more cheaply and rapidly than heretofore, and also, when desirable, to make wire netting of hard iron or steel wire, which is scarcely possible with the old form of machine. In the ordinary wire-netting machine one-half of the wire is wound on bobbins, but the other half, or every alternate wire, has to be coiled into small spirals, and carried in tubes, or "spools," which are rotated round the wires coming off the bobbins. These tubes carry but a very small quantity of wire, and this wire must of necessity be of a soft description. The expense of coiling the wire into spirals, the waste of material, and the constant stoppages of the machine required to insert fresh spirals and to make the joints, are a cause of great delay and serious cost, and these disadvantages are inherent in the present system. Great difficulty is also experienced in equalising the tension between the bobbin wires and those drawn from the tubes. In Mr. Dennis's machines these evils are entirely obviated by an arrangement which enables him to draw the whole of the wire direct from bobbins, on which they are wound in long lengths, and which assume naturally an equal tension. As these bobbins contain a sufficient quantity of wire to keep the machine running con-

tinuously the whole day, the constant stoppages inseparable from the use of the old type of machine (from 100 to 300 stoppages per day) are entirely obviated, and the production of netting is proportionately increased, while the uniformity of tension enables a superior quality of netting to be manufactured. By the use of hard bright wire the machine produces a rigid description of netting not yet in the market, but which has long been a desideratum, and which will doubtless be much appreciated by the general public.

With the many advantages the above machine possesses, Mr. Clark considers it cannot fail to have a very important effect on the whole of the wire-netting trade.

Correspondence

The Royal Academy and Education.

Sir,—Your discursive contributor has certainly added to my amazement by the twenty-seven questions which he has put to me personally in your last issue. Indeed, I think it a little hard that I should be expected to supply you with twenty-seven readable paragraphs merely to gratify the *amour propre* or allay the self-reproaches of an anonymous writer, whose article on "The Royal Academy and Education" seems to have attracted little notice from architects prior to the appearance of the letter which you were good enough to print from me on the 1st instant.

He has, however, raised two or three dogmatic questions which, if I do not answer them with a distinct negative, may be regarded by many as possible truths, and so injure the good cause which others besides myself have at heart. I have more than once thought, it is true, that the Academicians might be justified in interpreting certain terms of their famous "Instrument," drafted by Sir William Chambers—namely, the "Arts of Design"—as intending merely the arts of delineation, not invention, particularly as in the last century the word "design" (or *dessein*) did not bear the developed meaning which it bears at the present day. But there exists at the Royal Academy the original "diploma" of the Academicians drafted by King George III. himself, in which he wrote, with his own royal hand, "We have thought fit to establish . . . for the purposes of cultivating and improving the Arts of Painting, Sculpture, and Architecture . . . the Royal Academy of Arts." Need you and I, therefore, waste any more ink over this point?

The writer of your article asks:—"(17) Is it not a consequence of the training of artists for State purposes in France that the condition in general of architecture in that country is far below the condition in England?" And again—"(21) Is it not the fact that, in spite of the existence of a process for preparing Government architects in France, so little esteem is entertained for the profession that the civil code makes no distinction between architects and contractors, and every architect is responsible equally with the contractor for the stability of a building during a certain number of years, and in other ways is put on a level with him?" Now, sir, we are treading uncertain ground, and it may be as well to begin by stating that the condition of architecture in France and England cannot possibly be compared. The architect in Paris, and, indeed, in all the great Continental cities, practises architecture pure and simple. He is absolutely what in this country is called, with some affectation, an art-architect. The prosperity of the profession in England cannot be ascribed to profits realised from such a kind of practice, and if, here, wealth accumulates, it is due principally to the inclusion of surveying, valuing, house and estate agency, and similar branches of business, which in France are not generally included among the functions of an architect. The Parisian is, however, often compensated in other ways—within his legitimate artistic sphere—which do not obtain in England, for he will be generally employed on the same building for years after it has been completed, in order to keep it in repair, add to it, or embellish it. He is, moreover, the master of the several contractors he employs, and their social as well as artistic superior. In France the master artificer still exists, and the general contractor is still unknown. Hence the French architect is, as of old, the sole "master of the work," and responsible for it during ten years after he has delivered it up to his client. His responsibility, indeed, is very great and various. When I was practising in Paris, between 1860 and 1870, a well-known architect having stated in writing to his client that a certain building would cost so much, exceeded that amount, and was condemned by a court of law to pay the difference with costs. The Parisian architect, practising architecture pure and simple, is paid less, has more defined responsibility and larger powers, and a much greater amount of work to do for his "five per cent." than his *confrère*, the English art architect. The Parisian, moreover, is better trained and more highly respected than the Londoner; nor do I see how the State injures him or the condition of architecture by its fostering care of distinguished students. On the other hand, I must leave your contributor to sketch the relative condition of the mass of English art architects, toiling manfully over their drawing-boards, and of the eminent contractor whom they sometimes employ.

The writer of your article asks:—"26. Is it not contrary to experience, and to what is called common sense, to say with Mr. White, 'While a dominant body like the Royal Academy maintains a sham school of architecture, no institution in this country can succeed in establishing a real one'?" Sir, such windmills as that of Burlington House are not to be tilted at without first calculating the consequences. If the Royal Academy is still injuring, from a professional point of view, both sculptors and architects, let us not forget that the injury is inflicted with the personal approbation and sanction of the Queen's Most Excellent Majesty. Surely no institution, particularly one of which the Queen is a gracious benefactor, can loyally set up anything in opposition to a body whose active head and "great prime mover" is the sovereign in Her Majesty's personal capacity.

And now, Mr. Editor, if your discursive contributor thinks otherwise, and proposes to ask me any more questions, I must beg him to wait for my answers until next September, which is my only month of leisure in the year.—I am, Sir, your humble servant, William H. White.

London: October 13, 1886.

Damp Spots and Water-Colour Drawings.

Sir,—May I ask, through your queries column, if there is any means of eradicating or of preventing the growth of damp spots on a water-colour drawing?—Yours, &c.

Morley Street, Manchester: October 12, 1886. Collector.

GENERAL.

The Pictures for exhibition in the galleries of the Institute of Painters in Oil Colours will be received on Wednesday, November 3.

The Fine Art Jury at the Edinburgh Exhibition began their work on Thursday in last week. Sir John Millais, R.A., was, however, unable to attend.

The late Alderman Boothroyd, of Hanley, has bequeathed a sum of 5,500*l.* to the local school of art.

The Winter Exhibition of the Birmingham Art Circle opened on Wednesday.

The new Roman Catholic Church, at Chiswick, was formally opened on Wednesday. The building is Italian in style. On the exterior the walls are faced with red brick. It consists of a nave and two aisles, and deserves notice as an example of an effective but cheap church. Mr. John Kelly, of Leeds, was the architect.

Keymer Junction Station, on the Brighton Railway, between Burgess Hill and Hayward's Heath, which was opened for traffic early in September, gave way on Wednesday, carrying with it about 40 feet of the platform.

Messrs. Campbell, Smith & Campbell have supplied the whole of the stained and leaded glass that is seen in the Constitutional Club. By an oversight their names were omitted in the description given last week.

The Richmond (Surrey) Select Vestry are applying to the Local Government Board for sanction to borrow 100,000*l.* for sewerage works and purchase of land.

The Question of erecting the proposed Public Buildings at Newcastle-under-Lyme has been relegated by the outgoing town councillors to their successors.

Mr. T. Lockerbie, a brassfounder, of Glasgow, who died lately in London, has left 30,000*l.* for the building of almshouses in Edinburgh. It is proposed to erect cottages at a cost of 400*l.* each.

Mr. J. W. Dod, a merchant, of Bristol, has offered 5,000*l.* towards the completion of the western tower of Bristol Cathedral.

Terra-cotta has been definitely decided on for facing the proposed Birmingham Assize Courts.

Referring to our description and illustration of the Constitutional Club in last week's issue, we omitted to mention that about 1,000 feet super of Hayward's patent "Semi-prism" pavement lights, supplied by Messrs. Hayward Brothers & Eckstein, of Union Street, Borough, S.E., have been fixed some 3 feet wide all along the front. This firm recently fitted their pavement lights to the whole of the Hotel Métropole, and we understand they are now proceeding with those required for the Northumberland Avenue Hotel.

The Architect.

THE WEEK.

The project for the Jubilee Church House has so far advanced that the Committee are instructed "to select a site in a convenient position; to choose an architect of the highest standing; to arrange that the building shall contain one large hall capable of holding 3,000 persons, two smaller halls, some half-dozen (more or less) smaller rooms to serve the purpose of committee-rooms, an office and chambers for a secretary, with clerks'-rooms adjoining, and accommodation for providing light refreshments." As yet, nothing is said about the means that will be adopted for the selection of an architect, nor is it certain what is meant by "highest standing." Is it social position that is desiderated, or artistic power? The design for the building should undoubtedly be sought by competition. It is not an every-day subject, and could hardly fail to excite interest in every architect's office in the country. The importance belonging to the work would spur young and old to put forth all their power, and we are confident the committee would have many admirable designs offered to them. On the other hand, if there is any suspicion of favouritism attached to the selection of an architect, we are afraid that the enthusiasm in the memorial will be abated.

An interesting discovery has been made at No. 23 Arlington Street. That and some adjoining houses are being demolished to allow of an extension of the Bath Hotel, of which Mr. E. J. Tarver is architect. Sir Robert Walpole once lived in No. 23, and it was there his son Horace was born. On removing some woodwork a distemper painting was found of *Hercules and Omphale.* According to Mr. Tarver, the figures are of life size, and are represented in the grotto on Mount Tmolus, beyond which a landscape is seen. Hercules sits to the spectator's right, holding a distaff, from which he twines a thread in the direction of Omphale, who is clad in the lion's skin and leans on the club, which she holds in exchange for the distaff. It is hardly possible that, if the picture had been painted by an artist of any eminence, the owners would have covered it in a way that seemed likely to last as long as the house existed. We consider it is no more than an example of the wall-painting that was quite common in London houses of the early eighteenth century. There were a good many foreign artists in England at that time, and, as they painted decorative work with facility and for very small pay, many of them were employed on landscapes and classical scenes—the latter being only adaptations of engravings.

Can anyone explain the reason which induces competition committees to steadily oppose the exhibition of designs? So many cases have occurred lately that it may now be said to be an exception when designs are shown. The latest case is the Infectious Hospital in Liverpool. The Architectural Society of the city, and many of the competing architects, have vainly requested the Council to exhibit the designs. The conduct of the competition has, of course, been straightforward, but the unsuccessful competitors cannot help feeling dissatisfied unless they are able to discover why they were defeated. When designs are seen together it is often possible for an architect to derive a hint from some of them, and which may be of use in other cases. A committee is rendering a service to many people by an exhibition, and if for no other reason one ought to be held in every competition. Unless competitors stipulate for an exhibition they may give up the hope that an opportunity will be given to follow out the process of selection.

The Royal Commission has at last been appointed to inquire into the harbour accommodation, the arterial drainage, and the railway system in Ireland. The members are Sir Joseph Allport, Mr. James Abernethy, C.E., Mr. J. Wolfe Barry, C.E., and Mr. J. Todhunter Pim. Railways are well enough represented by Sir Joseph Allport, who has acted as a manager for many years, and Mr. Barry. Mr. Abernethy has a reputation as a harbour engineer, and he has even reported on one of the Irish harbours. Mr. Pim is a statist, and will represent commerce. But it is remarkable that no one on the Commission can be considered as an expert in drainage, although the districts specified in the Commission—viz., the Shannon, Barrow, and Bann—have swallowed up enormous sums of money without any advantage to the country, because works were carried out on the reports of engineers who were without sufficient knowledge of the conditions of the districts. Unless another engineering specialist is appointed the report can hardly fail to be misleading in one department, which by many in Ireland is considered to be the most important.

The arrival of a new Lord Lieutenant is of late made the occasion of exhibiting the grievances of the Royal Dublin Society. The Society has done good work for a century and a half. It has, at the same time, fostered agriculture and art. But it had to succumb to the centralising spirit which reigns in South Kensington. As yet the advantages are not apparent. Irish farming continues to be in a backward state, and the art schools have not produced a sculptor that will serve as successor to John Henry Foley. By great pressure the Government were obliged to grant money for the erection of a museum which is in progress. But no provision appears to be made for the erection of a building to contain the library which belonged to the Dublin Society. The address which was presented to the Lord Lieutenant on Saturday implores His Excellency to help the Society in its difficulty, since the temporary provision which it has been possible to make for the national library has become so insufficient as seriously to cramp the usefulness of that which is, perhaps, the most directly useful of the group of institutions.

There is an end to the proposal for erecting statues of kings on Blackfriars Bridge. Few except the favoured sculptors will regret the fiasco, for the subjects selected by Corporate wisdom had as little to do with the people who would gaze on them as any mythological abstractions. If wiser counsels had prevailed there is no doubt that four valuable commissions would be now in the hands of sculptors, and the Coalbrookdale Company could show what is possible in bronze casting when conducted under favourable conditions. What is now proposed is to place clusters of lamps on the pedestals. If of good design they will be better than nothing. In designing the bridge nobody seemed to care whether the blocks were occupied or empty, for the engineer's power of ornamentation could not go beyond the parapet.

There was much local satisfaction when it was found that the field known as Ravenscourt Park, in Hammersmith, was to become metropolitan property, and to serve as a public park. The sum of 50,000*l.* was to be paid, and the price could not be considered too low for ground that is intersected by a railway viaduct. The Metropolitan Board of Works intended to bring in a Bill authorising the purchase, but now the trustees of the property announce that they can obtain a larger sum from a private purchaser. So much eagerness prevails to secure the place that the Metropolitan Board can hardly help paying the trustees any sum they may fix. But the arrangement must be determined without delay, or it will be too late to give the notices that are requisite for a Bill.

The French Minister of War has somehow excited the opposition of many French newspapers, but, as an equivalent, he has gained the approval of painters. At his desire, the Ministry of Fine Arts has given commissions to thirteen of the principal painters of military scenes for pictures which are to be placed in the regimental salles d'honneur. Among the artists are MM. Protais, Detaille, Berne-Bellecour, Le Blant, Lewis-Brown, and Morot. The scenes depicted will be generally modern battles, such as Sebastopol, Solferino, and those in Algiers. But Hohenlinden, Marengo, and Moscow are not forgotten. We are glad to find that as yet nothing is said about Waterloo. General Boulanger also proposes to have a history of the different regiments prepared, which will be illustrated by photographs of the large paintings.

THE BARONY CHURCH COMPETITION.

IT was natural for architects to suppose at first that the principle of professional assessorships in competitions was henceforth to insure equitable decisions. They forgot that the great law of compensation could not be evaded, and that the new conditions of selection would bring new causes for complaint. It was also forgotten that everything which arises in the Institute seems doomed to be a failure.

Mr. John Honeyman, of Glasgow, was a zealous member of the Council of the Institute at the time when the new scheme for competitions was prepared; indeed, it could be said of him that every meeting he attended involved a sacrifice of time and money that was exceptional in the history of the Council. Mr. Honeyman was sanguine enough to believe that what he had aided in doing was to be the means of reforming all the abuses of competition throughout the country. His letter which appears in another page reveals that he has become a victim on the first trial he made of the new machinery, although it was of the most regular form.

It is needless to say to our readers that Mr. Honeyman has deservedly enjoyed the esteem of his countrymen, and that for many years the commissions for the principal Presbyterian churches in the West of Scotland have been placed in his hands. His clients were satisfied. It was not, therefore, extravagant to suppose that when the Barony Church in Glasgow was to be rebuilt Mr. Honeyman would be asked, as a matter of course, to undertake the work. But new ideas have forced their way into the Presbyterian curia, and, like the rest of the world, they are converted to a belief in the virtues of competition.

A limited competition was arranged, and Mr. Honeyman was asked to take part in it. We say deliberately that he should have declined. Practice is as indispensable to success in competition as in dancing on the tight-rope, and it is one of the exceptional events in the history of such struggles to find a man carrying off the prize in his first attempt. There are many dodges, legitimate and otherwise, which are only to be derived from experience, and by comparing one's unsuccessful work with the prize-winner. Now Mr. Honeyman, although he was willing to approve of the competitive system for others, and to support it as a judge, had steadily declined to become a competitor himself, and since he was successful, his career was often selected to point the moral of opponents of competition.

Mr. Honeyman was so much of a novice in competitive contests, that when he was told the Barony Church was to cost 13,000*l.* he acted as if the commission had been put into his hands, and prepared a set of designs that could be carried out for that sum. That we need hardly say was an infraction of the golden rules which lead to success. It is needless to add that Mr. Honeyman stood almost alone; the majority of the unsuccessful, as well as the successful, competitors had acted on the principle that is as effectual in competitions as in drapers' shops, namely, that judges and committees are liable to be tempted, and when they see a fine thing will make a sacrifice to secure it. If that mode of doing business is unknown in Glasgow, Mr. Honeyman had only to recall the history of the most important of the modern competitions in Scotland. How did Sir Gilbert Scott contrive to carry off the Edinburgh Cathedral from native competitors? He displayed drawings in what might be called the subjunctive mood of design, and the pictures were too much for northern caution to resist. The trustees set aside the report of their adviser, and crippled their resources to erect the building with the lofty steeple which is now to be seen.

When, therefore, we find Mr. Honeyman asking, "Could the designs submitted in this competition by Messrs. Burnet & Sons, Messrs. Landless & Clifford, Mr. J. B. Wilson, and Mr. John Hutchison be carried into execution, with spires and every other feature and detail exhibited on any of the drawings to the committee, for the stipulated sum of 13,000*l.* or not?" he is simply revealing his own inexperience as a competitor.

We believe that Mr. Honeyman, when he acted as judge in the Hawick competition, began his duties by setting aside every drawing that was supposed to be without relation to the sum that was named. He gave dissatisfaction by so novel a course, and we imagine a larger sum has had to be expended than was anticipated. Such trifling affairs as competitions cannot escape the eyes of Nemesis. Mr. Honeyman now suffers because he interpreted the Glasgow conditions as he did the Hawick. The fact is, that in competitions as in theology there is an esoteric as well as an exoteric meaning for words, and the safe man is one who has been successful in making out what was intended rather than what is written. With a rigorous interpretation of formulas a modern Presbyterian church becomes an impossibility.

It is sad to find that Mr. Honeyman entered on a competition with so little acquaintance with the equipment that is necessary in such encounters for anyone who is eager to be victorious, and that he persists in an endeavour to force the committee and judge to explain matters which are tacitly accepted as fitted for concealment. He begins a long correspondence by asserting that up to the present there has been no competition at all, because in the successful design the condition of cost was disregarded. "Every member of the committee will, I think, see and acknowledge," says Mr. Honeyman, "that they have seen and been impressed by a design by Messrs. Burnet, which would cost about 18,000*l.*, when they have only seen a design by me costing about 12,000*l.*, and that they have not the least idea what kind of a design I could produce for 18,000*l.*, or how it might have affected their judgment." But why did not Mr. Honeyman endeavour to discover the inclination of the committee and act upon it? He tells us he was acquainted with the clergyman. Now a thirteen-thousand pound church is manifestly inadequate to display the orators who are selected to hold forth in the Barony Church. There is money in the congregation, and if one of the select competitors sent in a design to cost 28,000*l.*, the pastor of the church would be sure to set his heart on such a shrine for himself, and the design might therefore win. We admit the risk, but it is generally by risking much that big competitions are gained.

There is another point which suggests that Mr. Honeyman is outstepped by the age. Evidently he believes that architecture, like doctrine, should be orthodox. He writes to the secretary of the committee saying, "I have the very greatest respect for Mr. Pearson's judgment as a Gothic architect, and would never think of questioning his decision as to the relative artistic merits of the designs submitted to him, but in the present instance that was not the only consideration—there was special adaptation of the building as a place of worship for Presbyterians." What would become of assessors if a restriction like that suggested was enforced? By virtue of their appointment assessors must be held to know everything and to be infallible, otherwise the old system would be preferable. May we not even suppose that one of the causes through which Mr. Honeyman failed was the orthodoxy in his arrangements? Every day there seems to be an approach towards English ways in Scotland, and we are surprised that Mr. Pearson was not asked to design the Barony Church instead of reporting on the designs. If Mr. Honeyman insists on consistency with the old ways, he will find that he must betake himself to the hills like the Covenanters, and run the chance of arrest as a trespasser.

When we said that architectural assessors are supposed to know everything, we should have made one exception. The gentlemen who are selected occasionally show a strange unacquaintance with the ordinary laws of courtesy. Mr. Honeyman wrote a civil letter to Mr. Pearson, announcing that he had declined to accept the fee which was the reward of the unsuccessful competitors until the affair was cleared up, and he requested Mr. Pearson to aid him in expiscating the facts. Mr. Pearson is a timid gentleman, and may have fancied at first sight of the word expiscating that he was expected to assist in skinning the committee by whom he was employed, or in some similar operation. But whatever may be the extent of his temporary embarrassment, it was not enough to explain the sending of a curt letter written by a clerk to a brother-architect in the position of Mr. Honeyman.

Having failed in his own applications, Mr. Honeyman, still clinging to old ways, and believing that writers are possessed of an extractive power, turned the case over to his lawyers. He might have known that the committee had also a resource of that kind. Mr. Honeyman's lawyers

argue that their client has a right to see Mr. Pearson's report and the measurer's estimates, the committee's lawyers say they are confidential documents. Mr. Honeyman's lawyers assert that there were two designs submitted by the winners, although described in the explanatory statement as "the design." The committee's lawyers reply by saying "it was not intended that this explanatory statement, prepared for the committee alone, should be subjected to the minute verbal criticisms of competing architects or their agents. All of these criticisms, moreover, could have easily been obviated in the present case by the simple expedient of preparing two descriptions instead of one, or by the use of the plural 'designs' instead of the singular 'design,' and other like trifling alterations. What difference this could have made in the merits of the case we do not see," and they maintain that the committee's procedure has been in harmony with the conditions of the competition. Mr. Honeyman's lawyers retort by writing—"The contract from its nature required exact performance, and infers the right of each architect to see the plans and descriptions of the other competitors, and the right to receive from the committee the frankest statement of their proceedings, and the production of such papers as may be required to show that on their part they have observed the conditions which they imposed. The committee in this case have persistently refused all information and all access to papers under their control, and we share our client's opinion that he has been treated uncourteously and unjustly."

Here the case ends for the present. Will it go further? Considering the hazy language of the conditions, we do not advise Mr. Honeyman to seek the opinion of the Scottish Courts on the matter. But we have so often condemned the procedure for conducting competitions that we have no hesitation in saying that Mr. Honeyman has right on his side. Under the new system the merits of competition designs are ascertained in secret, and no one but the judge knows what process is adopted. It is only in exceptional cases that the report appears. If it is withheld, it is supposed to be out of commiseration for the competitors. In the case of the Barony Church it is said that all the designs are "freely criticised," and in consequence the report was reserved "only for the consideration of the committee." Now, we hold that the judge is not worthy of his office who does not freely and severely criticise the designs, but the competitors should not be condemned behind their backs. A competitive architect cannot afford to be thin-skinned, and he is not likely to wince under a statement of his defects. This is only common justice. When the system was introduced the utmost publicity should have been advocated; but at that time what was sought was the creation of a body of judges, and their convenience rather than the needs of architects in general. The Barony Church case is only one among many in which disappointments have arisen from the system which Mr. Honeyman himself helped to create.

THE TREASURES OF CHANTILLY.

IF anyone will open the volume on Mdlle. de Longueville by M. Cousin, says M. Charles Yriarte, and read the chapter devoted to the Grand Condé, they will see from a note written in 1843 that the Duc d'Aumale (then a young officer in command of a column in Africa) was thinking of a reconstruction of Chantilly, and had obtained several projects for the work. The prince had even caused something to be undertaken under the direction of M. Duban. But the Revolution of 1848 suddenly burst out, the projects were set aside, and the "Châtelet" was let to Lord Cowley. Things so remained until 1875.

Twenty-seven years after the revolution of February the prince, who was still under the sway of his idea, which had meanwhile refined and developed, called M. Henri Daumet to his aid. He explained his programme to the architect, and asked him to direct the reconstruction. The prince was a widower; he had also lost his sons, the Prince Condé and the Duc de Guise. There was no longer a necessity to provide for grand installations. Chantilly could thus become a residence, and a museum of souvenirs of its old days and of the Renaissance. In it could be placed memorials of the Grand Condé and the superb relics of the Château of Ecouen—examples of French art in its finest epoch which had come to Condé as heir of the Montmorencies.

Instead of constructing a new château and ordering decorations and furniture for it according to determinate plans, the château may be said to have been constructed for the sake of its accessories, since they were not merely works of art of great value, but they were the only witnesses remaining of the history of the building which had been destroyed. In them lies the spirit of Chantilly. The stained-glass windows of the Château of Ecouen, which are *chefs-d'œuvre*, had been found under one of the last Condés. The architect had, therefore, to provide a chapel to enshrine them as well as the old woodwork from Ecouen—which was also admirable in style. The latter comprised the fine altar by Jean Bullant and the bas-reliefs by Jean Gougon. The reliefs had been confiscated, but at the Restoration they again came into the possession of their legitimate owner.

Nearly everything had a similar history. Statues, altars, tapestries, furniture, enamels, bronzes, tombs, and funeral urns, which had been violated during the Reign of Terror, were only brought together by great trouble after forty years' seeking. Some objects were carried to the prince because it was known that, in his enthusiasm as a collector, he paid liberally for such things. When secured they had all to be adjusted and put in position. In fact, the programme which was laid down for the able and ingenious architect arose from the possession of so many historical waifs and strays.

There was another influence at work to aid in determining the character of the new buildings. The marvellous substructure existed still. The fosses, the triangular site, and the subterranean parts prescribed the form of the upper portion. The architect was therefore forced to keep within the rather bizarre perimeter laid down by the early builders. It had been accepted by Montmorency, and then by the Grand Condé, so the Duc d'Aumale could not avoid following them. The great towers of defence at the angles, the massive counter-forts, the posterns, and the drawbridges existed on the plan, and it was inevitable that they must also form a part of the new façade.

Let us suppose that the visitor enters the modern château by the "Constable"—that is, by the great slope which unites the rock with the esplanade where a statue of Anne de Montmorency is placed. In the centre of the façade is the postern; right and left are the approaches (the substitutes for the drawbridge of the heroic times) by which the fosse is scaled. On entering we find ourselves in the Cour d'Honneur; on the left is the vestibule leading to the interior. It gives access to a second, and we find on our right the Galerie des Cerfs; on the left is a staircase which leads to the chapel, and in front is the upper storey of the châtelet, which is built at the foot of the rock.

In the "Galerie des Cerfs" the visitor observes the chimney-piece over which is painted the *Vision of St. Hubert* by Paul Baudry, the saint being a portrait of the Duc de Chartres. Over the entrance is the Minstrels' Gallery, which is carried on sculptured corbels in Renaissance style; access to the gallery is obtained by a narrow staircase concealed in the wall. On one of the walls are the great tapestries by Van Orley, formerly belonging to the Comte de Toulon. The "Galerie de Peinture" adjoins, and is the largest of all. In it all the schools are represented by some specimen that was carefully selected. The "Tour du Nord" is devoted to drawings by the great masters. The ceiling has for subject the *Flight of Psyché* by Baudry. The same artist has painted the voussoirs with winged figures that are typical of the arts.

The "Galerie de Psyché" is long and rather low. It was constructed specially in order to receive the important series of stained glass windows from the Château d'Ecouen, representing the story of Psyché. They are most precious examples of grisaille, and local tradition has attributed them to Bernard Palissy himself. Marc Antonio made engravings from them. On one of the walls appropriately lighted by the glass are original historic portraits of French celebrities of the age of Henry II., with drawings by various masters.

At the extremity of the gallery is the "Tour du Trésor," which is a sanctuary of art. It is devoted to objects which have to be enclosed in cabinets, such as small antique bronzes, statuettes, gems, bijoux and other interesting objects.

As the "Galerie de Peinture" and the "Galerie de Psyché," meet at an angle, the Florentine plan is adopted, and a tribune is formed in the intervening space between the two. It contains the cabinet of engravings. Here, also, is placed the famous Raphael which the Duc d'Aumale purchased from Earl Dudley at a fabulous price. Beside it is another Raphael, the *Vierge des Orleans*, and it has for companions pictures by Lippi, Botticelli, and other masters of the fifteenth century, with pictures which belong to the period of Romanticism in France. This tribune will be hereafter a shrine to which students of art can turn from all countries.

The chapel, as has been said, is enriched with works from the chapel of Ecouen. The windows form a *chef-d'œuvre*. The glass represents the Constable Montmorency on his knees with his wife and children. The woodwork from the same building reappears on the walls. The altar is by Jean Gougon. In the

circular *chevet* are the tombs of the Condés, which were rescued during the Reign of Terror, after being carried off from the Church of St. Paul, Paris. They are adorned with statues by Pierre Sarkazin, and it may be remarked that all the artists whose names are associated with the chapel are Frenchmen, and belong to the best period of French art.

The small "châtelet" is interesting for two reasons. It is probably the only example that remains intact of the work of Jean Bullant, the architect, who worked with Philibert de Lorme, and is especially associated with the Grand Condé. The hero of Rocroi, amidst all his alterations, respected this part of the Chantilly of the Renaissance. While the château might be said to be assigned to the King, and to expensive assemblies, Condé made of this his own habitation, and desired to give a modern character to the interior. The woodwork, paintings, tapestries, furniture, decorations, are masterpieces of the best artists of the period of Louis XIV.

It is unnecessary to say that the cavalry of Augereau, the Récidivistes of the Terror, the Tricoteuses, and the Black Band left little behind them. The Minister of War under the Directory had, however, saved the façades. Years afterwards, by force of patience and gold, many of the objects were brought back and restored to their original places. Several salons have been reconstituted. In one of them the Duc d'Aumale has deposited his famous collection of rare and unique books.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

THE first ordinary meeting of the winter session of this society took place on Monday evening, in the new rooms of the Institution, Croft's Chambers, Infirmary Street, Leeds. The chair was occupied by Mr. C. R. Chorley, F.R.I.B.A., president. On the walls of the lecture-room and library were exhibited the drawings of the students connected with the society.

The Secretary (Mr. Bulmer) read a letter in which the Royal Institute of British Architects expressed their sense of the zeal, energy, and professional good-will shown by this society in organising and carrying out the examination held in Leeds during February last.

The President distributed the prizes won by the successful students, the results of the examinations being as follows :—

The society's silver medal and five guineas, to Mr. Fred. Mitchell, for a set of drawings of Oakwell Hall, Birstal.

Three guineas for drawings of a warehouse showing construction, to Mr. Hardman.

Three guineas for the best design of a fountain, to Mr. Tute

Two guineas for the best set of drawings done at the class of design, to Mr. Twist.

Two guineas for the best work done in connection with the Sketching Club, to Mr. Bedford.

Three guineas, given by Mr. John Franks, for the best design of a country hostelry, divided equally between Mr. Rhodes and Mr. Hardman.

The President, in his opening address, congratulated the members on the uniform success which had attended the work of the society. The younger members had been enterprising and active, and the Sketching Club had worked assiduously. He had no desire to decry the value of sketching, but he would offer a word of caution against devoting too much attention to that enjoyable department of work to the detriment of the more solid and less pleasurable portion of an artist's acquirements. The architectural student could no longer plead ignorance of the curriculum to be followed in preparing for his future calling in life. That had now been carefully laid down by the Royal Institute of British Architects, and it could not be too often or strongly impressed upon the coming race of architects that in the near future no one could hope to be held in esteem by the public, or consider himself qualified for the pursuit of the profession of architecture, who had not, by successfully passing the examination, qualified himself for admission into the circle of the Institute. It was to be regretted that Leeds students had not yet shown themselves fully alive to the duty which lay before them of preparing for taking this examination, and it was a melancholy reflection that the town, in this respect, compared very unfavourably with others of the same importance. There was no lack on their part of industry, yet it was at present undisciplined and often misdirected. He urged them to pursue their studies with a definite object in view, viz, qualifying themselves for reasonable proficiency in all the branches of knowledge which the practice of architecture demanded. He must speak in the highest terms of the quality as well as the quantity of the work done by some of the associates. The drawings presented in competition for the different prizes offered by the society were admirable. He particularly mentioned those submitted by Mr. Mitchell, which had carried off the silver medal of the society. These were all executed in the most praiseworthy manner, and their number showed an industry of which he could not speak too highly. The general work of the society had shown uniform if uneventful progress during the year. The most significant mark of this was seen in the necessity which has arisen for removal to larger premises. Less than ten years ago they met in a cellar of the Mechanics' Institution. The advance made in so short a time had been manifestly considerable. They must strive to maintain the same rate of progress, and seek in all directions for openings of usefulness. Financially the society was in a sounder condition than it had ever been before. They had been able to almost extinguish the liabilities which the activity of the past had laid upon them. Their assets, he believed, were more than sufficient to meet any claims that could be made against them. He acknowledged the great services which Mr. Fraser had rendered as hon. treasurer, and hoped they might long retain him in that position. They had been enabled to make an addition to their very insufficient library. All the works purchased had been selected with a view to assisting those students who were desirous of preparing themselves for the examination of the Royal Institute of British Architects. The library should have the first claim on the attention of the committee whenever they had any spare funds at their disposal, and he looked forward to constant additions being made to it in the future. He would particularly invite the attention of the members to the certainty of their being held in grateful memory by the society if they had the generous foresight to bequeath the architectural and artistic contents of their bookshelves to it. Amongst all the provincial architectural societies theirs had steadily led the way hitherto, and set an example of energy and foresight which others had not been slow to emulate. If they were to maintain this position, there must be no relaxation in their watchfulness and no stagnation in their movements. Above all, they must ever remember the pre-eminent importance of collective action, and the pressing need for setting aside individual advantages for the general good. A pleasing result of their change of premises had been that they were now enabled to place their sanitary exhibits in a position where they could be properly seen, and where the public could assess readily the advantages offered by the many improvements which recent years have made in sanitary science. They must foster this particular section of the museum in order that it might illustrate the practical aids which manufacturers now afforded towards the establishment of really healthy houses, and towards which object their indefatigable townsman Mr. Teale had done such yeoman service. Attention had recently been again called to the ever-recurring question of competitions, by the erratic and aimless movements of the Corporation Committee, who had in charge the arrangements for the erection of an Art Gallery for Leeds. Not the least peculiar of the resolutions arrived at by this body had been one rejecting, somewhat brusquely, the advice of the society regarding the sum to be expended on the erection of the new building. The opinion of nearly all the leading architects of Leeds, men of all others the most competent to form a sound judgment on a question of the cost of building operations, was entitled to influence the decision of the Art Gallery Committee, however well and wisely they might consider themselves to be advised. That opinion ought to have been doubly binding on them, because the most experienced of their professional advisers held views in the matter coinciding with their own. How absurdly ridiculous the amount fixed for the erection of the art galleries was, in comparison with the work to be done, any rational and honest architect would admit, when he heard that the rate per cubic foot which the Leeds Art Galleries Committee considered sufficient to erect public buildings hardly exceeded threepence. This, too, to include fireproof floors and all the special arrangements for lighting, ventilating, heating, &c., which the future presence of valuable contents demands. With care and economy a cottage house of the poorest character might be erected at this rate; but he defied the committee or their advisers, whom they quoted, to name one single public building of the same class, which was not a temporary erection, that had been completed for anything, even approximately, near the sum they had named. The curt disregard which the committee had shown for skilled testimony in the matter would certainly end in their landing themselves in a position from which they could only be withdrawn with ridicule to themselves and injustice to others. It was the duty of the society to keep a watchful eye on all that concerned the art of architecture, and to use their special knowledge in such a way as to prevent other bodies, which could not possess the same information on particular subjects, from misleading the public or wronging the ratepayers. That duty they would practice in spite of any taunts of being an "interfering and fussy body," and thus throw on others the onus of having involved themselves and the town in an undignified and ridiculous position. The committee had resented one very natural objection to their having widened the area of competition at the eleventh hour. That they had a perfect and

undeniable right to invite open competition no one would wish to gainsay; but, having once tempted local architects to engage in the preparation of designs by a distinct promise that the competition should be limited to them, it became a distinct breach of faith and a gross injustice to local architects to alter the whole basis of the contest long after the issue of the conditions of competition. Some of the local competitors would not have taken part in the contest had it not been a distinct engagement that the number taking part in it should be limited; others were actually debarred, in the absence of a professional assessor, from making use of the work they had already done before the changed conditions were issued, and in reliance on the belief that the word of honour of a committee would be as binding as it would be in the case of an individual. Having referred to some of the buildings of note which have been erected in the town during the year, the President called attention to the completion of the new charter of the Royal Institute of British Architects, so far as the labours of the Institute itself were concerned. This document was now before the Privy Council, and so soon as their and the Queen's assent was given to it they hoped to find the Institute engaged in the preparation of the by-laws. Another subject for congratulation was the increased tendency which the promoters of public architectural competitions showed in favour of the appointment of professional assessors to assist in the decision of these contests. That this movement was largely the outcome of the great spirit of cohesion which architects now exhibited was unquestionable. In conclusion, he said the cloud which had so long rested over building industries had as yet shown no decided signs of lifting. At all other points except the one of material prosperity their profession had advanced, and was advancing, and he earnestly trusted and believed that this progression, artistic and moral, would continue, and that the society would play well its part by helping on all that was for the true benefit and interest of the noble art of architecture.

Mr. T. Pridgin Teale moved a vote of thanks to the President for his address. He remarked that there were points of contact between the architectural and medical professions. Perhaps the most important of these was the sanitary one. It had been the business of the medical profession to discover how much illness arose from sanitary defects, and, having discovered it, to go to the architectural profession and say, "Will you find out the best way of getting rid of them?" Since those discoveries there had accrued an enormous amount of knowledge about architectural details which had a bearing upon the health of the occupants of houses, and there had been added to the duties of architects, and in some senses to their labours, a new department of their studies. It was a curious coincidence also that that evening they were meeting in the old operating theatre of the Leeds Infirmary. Referring to the education of the rising members of the architectural profession, Mr. Teale urged the importance of practical work being made a test in examinations.

Mr. L. Cooper, in seconding the motion, concurred with the remarks of the President with respect to the proposed Art Gallery, adding that people would not send pictures, statuary, or other works of art to be placed in back premises and in the most beggarly constructed place in the whole borough. He trusted the society would use every effort to prevent such a great wrong being done to the town.

Mr. E. Birchall and Mr. J. B. Fraser supported the resolution, and it was adopted.

It was announced that a contribution of five guineas had been received from Mr. Chorley in aid of the library of the Institution.

MR. HENRY MOORE, A.R.A., ON ART.

At the last distribution of prizes to the students of the Ealing art classes, Mr. Henry Moore was present, and delivered the following short address on "The advantages of learning to draw, to the skilled workmen and workwomen of all kinds." He said:—Though I am a painter, rather than a decorative designer, I may be able to suggest to you a few ideas which you may be able to turn to practical account, and, if I do, I shall have succeeded in my object. The decorative instinct seems to be inherent as part of our nature, for we find indisputable testimony to the fact that the prehistoric races possessed this faculty in a high degree, and the carving on the tusks of the mammoth and on the horns of the reindeer, executed by those races, show an amount of art feeling far in advance of that displayed by the modern Esquimaux, and who do similar work, but indifferently. Drawing is the beginning of everything. It is almost like the discovery of a new sense, and from the time we begin to draw objects we begin to discover their beauties, for it is a fact that we never draw without comparing, and this comparing one thing with another is the beginning of the formation of taste or judgment. The moment you represent an object you begin to discuss its artistic worth; you weigh its proportions and lines, and, in fact, judge it from the art point of view. It seems to me that so much has been said and written on the advantages of cultivating this faculty which is inherent to us all, more or less, that it is almost superfluous to press the subject on you. But the recent inquiry by the Royal Commission and the Press have proved, beyond doubt, that we are behind in these matters, that is, we have the sense to know a good thing when we see it, without having the power of originating it, consequent on our want of facility in drawing, and that is why we prefer many goods of foreign manufacture to those of home produce, and we are told by dealers that they are in better taste. It may not seem very patriotic, but it seems quite natural that we should take a thing that pleases us—dress or what not—without stopping to inquire whether it is of home manufacture or not. Formerly we were content to get our articles of taste and luxury from abroad, or to employ foreign designers; but we have entered upon the race, and it is no longer a matter of choice whether we will continue it. Our national prosperity depends in a large degree upon it, so it has become a matter of the extremest importance that we should make art education a serious business, and the facilities for doing so much more numerous than they were formerly, in the way of art schools, &c. When I was a youth an inclination to art was looked upon as a sort of amiable weakness, and parents did their utmost to dissuade their children from choosing it as a profession. Holman Hunt and many other great men are what they are in spite of opposition. Now it is quite a different matter, and art training has become a necessity. What is there, from a button to a girder bridge, to which it is not of importance? I have been round the room to see the drawings, and find many of them to be excellent, and would say, in conclusion, be serious in your work, always do the best work that is in you, and never leave what you have begun so long as you can add to it quality, texture, reflected light or shadow, anything that will add to its truthfulness, for in that consists what we call finish, not mere smoothing and labouring of the tints, but actual additions that will make it nearer to nature than it was before.

THE CORPORATION ART GALLERY, BIRMINGHAM.

Some of the pictures lent to the gallery by Mr. G. F. Watts, R.A., have been returned to London, as Mr. Watts desires to work upon them before sending part of his collection to South Kensington. The other portion Mr. Watts has sent to the Corporation of Nottingham for exhibition in their Art Gallery at Nottingham Castle. The whole collection will, says the *Birmingham Post*, leave Birmingham towards the end of the present month, after having been here for nearly a year, during which it has been greatly appreciated by the public. Birmingham, indeed, is very sensible of the obligation conferred upon it by Mr. Watts by the prolonged loan of so many of the greatest works of his life, some of them ranking with the noblest examples of English art.

On the removal of the Watts Collection, another of great interest will take its place: one the preparation of which is already so far advanced as to be nearly complete. This is an exhibition of the landscapes of Mr. F. H. Henshaw. Though, in his earlier life, Mr. Henshaw spent some years in London, yet, like his friend and former fellow-worker, David Cox, he chose Birmingham—his native place—as his permanent home. For over fifty years his name has been intimately associated with the town, and many of his finest works are the records of scenes in Warwickshire, notably in the Forest of Arden, especially in Packington Park, where some of the grandest oaks in England are to be found, and where they were still more plentiful forty years ago. But Mr. Henshaw's works are by no means confined to that district. The West and South of England, Yorkshire, Wales, Scotland, and Ireland were, for many years in succession, the scenes of his studies, and occasionally he extended his painting tours to Switzerland and Italy. In all places and at all times he was constant to his favourite subjects of wood, mountain, and water, in all the varieties of season and of effect; his pencil was capable of rendering with equal perfection the solemn shade of English woodland, the brightness of pastoral landscape under a summer sky, and the poetic gloom of an Alpine or a Highland pass. In the painting of trees and of river scenery few English painters have approached and none have surpassed him. When his works are brought together, representing a period extending from 1828 down almost to the present day, they will, in the range of Mr. Henshaw's subjects, constitute well-nigh as great a revelation of variety and power as did the first great collection of David Cox's works at Liverpool. It is rare indeed for one town to have the records of its art enriched by two such landscape-painters as Cox and Henshaw, and it is a source of high satisfaction to those who justly appreciate the survivor of the two to know that his genius will be worthily illustrated by the exhibition of this collection, while he is still with us in the enjoyment

of the calm repose of age, and with the capacity still, in a quiet and leisurely way, to practise his art.

We are glad to say that the desire of the Art Gallery Committee to form a collection of Mr. Henshaw's works has met with a prompt and hearty response from the possessors of the best examples of the painter. In no instance, we believe, has there been hesitation in complying with the request of the committee, still less a refusal; and we look forward to an exhibition containing probably a hundred and fifty carefully chosen works, all of high quality, and so varied as to illustrate all the fields in which Mr. Henshaw has studied, all the subjects which have specially attracted him, and the full period of his activity as a painter. One feature of the collection will be very notable, namely, that a large proportion of the pictures will be actual out-of-door work, for long before landscape painters generally finished their pictures on the actual scene, Mr. Henshaw learned and practised the great secret that a picture made up in the studio, from notes and sketches, never can possess the charm, the freshness, or the truth of one studied direct from Nature, and then left untouched. We must not, however, be tempted into an anticipatory criticism; all we have now to do is to tell the public what is being prepared for them, and to promise all true lovers of Nature a great enjoyment. We may add that some time will necessarily be occupied in bringing together and arranging the pictures already promised; but that it is hoped to open the Henshaw Collection in the course of November.

THE BRITISH SCHOOL AT ATHENS.

A MEETING of the supporters of the British School at Athens was held in Albemarle Street on Monday. Professor C. T. Newton was chairman.

The following report of the executive committee was read by Professor Jebb :—

The principal duties imposed on the committee at the meeting of February 2, 1885, were two—first, the building of a suitable house for the director, with a library and lecture-room attached; and secondly, an appeal to a large number of learned bodies for assistance in providing a suitable income for the maintenance of the school. The committee are happy to report that the first of these proposals has been successfully carried out. With the generous assistance of Mr. Penrose, who placed working plans at the disposal of the committee free of charge, a suitable house has been built on the plans submitted to the meeting, and the final instalment of the amount due to the contractor has been forwarded to Mr. Merlin, British Consul at the Piræus, with a request that he should take possession of the building in the name of the committee. The committee take this opportunity of thanking Mr. Merlin for the warm interest he has taken in their work, and the invaluable assistance and advice which he has at all times been ready to place at their service. The contract for the building amounted to 76,467 frs., almost exactly the 3,000*l.* at which Mr. Penrose, when laying his plans before the subscribers, estimated the cost. The honorarium of the Athenian architect, Mr. Theophilas, to whom the superintendence of the work was entrusted, and certain extras, chiefly connected with the garden, have brought up to the total cost to 3,240*l.* Mr. Penrose, who has, at the request of the committee, twice visited Athens during the progress of the works, has expressed his entire satisfaction with the manner in which the contract has been carried out. The committee have much pleasure in reporting that an immediately adjacent site at Athens has been granted by the Greek Government to the American school. In August 1885, Professor Charles Eliot Norton, on behalf of the American committee, wrote a most cordial letter when this offer was in contemplation, suggesting that a great saving of expense might be made by both schools if it were possible to build a common library, and thus avoid the duplication of expensive books of reference, and generously offered as a foundation the considerable collection which had already been made by the American school. The English building, however, was by this time too far advanced to admit of any common structure; but, in reply to Professor Norton, the committee expressed the hope that, by agreement as to purchases and a liberal system of mutual lending, it might be possible to effect the saving proposed by the American committee, so far, at least, as regards the rarer and more costly works so essential to an archæological library. This suggestion was very favourably received by the American committee. It remains only to indicate briefly the present aspect of the undertaking. The total amount subscribed and promised towards the capital of the fund has been 4,474*l.* 6*s.* There thus remains a balance in hand, as appears from the financial statement, of 1,027*l.* 14*s.* 4*d.*, including, of course, the subscriptions promised but not yet paid. Of this it is estimated that about 350*l.* will be required for furnishing, &c., leaving some 650*l.* for the foundation of a library and other initial expenses. In accordance with the second resolution above alluded to, applications for annual subscriptions were sent to the following bodies :—The Universities of Oxford, Cambridge, London, Durham, Dublin, Edinburgh, Glasgow, Aberdeen, and St. Andrews; University College and King's College, London; the Royal Society, the Royal Academy, the Hellenic Society, the Royal Geographical Society, the Royal Institute of British Architects, the Society of Antiquaries, the Royal Society of Literature, the Royal Archæological Institute, the British Archæological Association, and the Society of Dilettanti. Most of these, we regret to state, replied either that they had no spare funds beyond what was required for pressing needs of their own, or that they were precluded by their constitution from subscribing to such a scheme as the present. But it is with great pleasure that we can report the handsome offer of 100*l.* a year from the University of Oxford, and a like sum from the Hellenic Society, in each case to be continued for three years, and to become payable as soon as the school is in working order. The Hellenic Society further stipulates that their subscription should be conditional upon the provision of at least 300*l.* a year from other sources. Of this 300*l.*, the contribution from the University of Oxford provides one-third, and annual subscriptions to the amount of about 70*l.* have been promised by individuals. An anonymous donor has most generously offered to guarantee the balance of the 300*l.* for the three years covered by the grants from Oxford and the Hellenic Society, so that an income of 400*l.* is now, at least provisionally, secured. This fact has enabled the executive committee to avail themselves of a most timely consent on the part of Mr. F. C. Penrose to assume the directorship of the school for the first year, beginning in November 1886. The committee need not point out the importance to the welfare of the new British school of its being thus inaugurated under the guidance of an archæologist of European reputation in his own department, and an authority second to none in regard to the architectural monuments of ancient Athens. But the satisfaction which the committee naturally feel in announcing Mr. Penrose's appointment must not blind them to the duty of reminding themselves, and the general body of subscribers, that strenuous efforts are still required to place the school upon a thoroughly sound financial basis. In the first place it is not right that the anonymous donor above referred to should bear the whole burden of making up the income of the school from about 270*l.* to 400*l.* for three years. In the second place it must be remembered that this income of 400*l.*, though sufficient to justify the opening of the school, is a bare minimum for its maintenance and proper development. The committee have already stated in a previous report their conviction that an annual income of from 700*l.* to 800*l.* is essential to the thorough efficiency of the school. The most satisfactory plan would be to secure a permanent endowment, whether by investing a large sum of money, or by the application of educational funds already existing. But if this be not practicable, the only remaining course is to solicit annual subscriptions from those who are interested in the undertaking. The treasurer will gladly forward the usual banker's order to all who are willing to act upon this suggestion, and to promise subscriptions annually or for a term of years. The Bishop of Durham, who presided at the last meeting of subscribers, justly urged that the honour of Englishmen was nearly concerned in the speedy establishment of a British school at Athens. The committee feel that the permanence and efficiency of the school when established is a matter of not less national importance. They appeal, therefore, confidently to all who have helped them so far, and to those who have, for whatever cause, held aloof, to see to it that an adequate endowment is provided, in order that the British school may compete, in generous rivalry and on equal terms, with the French and German and American schools, which have already done such excellent work in the field of Classical archæology.

The Chairman, in moving the adoption of the report, congratulated the meeting on having obtained the services, as their new director, of such a veteran in archæology as Mr. Penrose. What was now wanted was an efficient staff to work under the director and to go hither and thither, reporting every fresh discovery, first to their chief and then to the committee of the school and the subscribers. To provide such a staff we ought to imitate the example of Germany and France, which are in the habit of sending out young men who had received special training under archæologists, such as M. Waddington. Special measures would have to be taken for the training of such students. To enable the school to do its work efficiently money was absolutely required, in order to make allowances for the travelling and other expenses of young men engaged in the work of exploration. He hoped that the interest shown in this work would not be of the temporary character which too often attended undertakings at first heartily entered into, but subsequently neglected or abandoned. It was a national disgrace that we should have left the peribolus of the Temple of Artemis at Ephesus to be explored by some future architect not of our own race.

Professor Jebb then moved the following resolution :—"That the present committees (general and executive) should

now be dissolved, and that a managing committee be appointed, to be composed as follows :—1. Of the three trustees and the treasurer *ex officio* and the hon. secretary. 2. Of five members to be appointed annually by the general body of subscribers. 3. Of members to be nominated, one by each corporate body subscribing not less than 50*l.* per annum towards the maintenance of the school." He said that it was just forty years since the French school at Athens was established ; it was just four years since the American school was opened there. If England was somewhat late in doing what France, Germany, and America had done, we might at least remember that the province of work was one in which Englishmen were not newcomers.

It was announced that Mr. Walter Leaf would be the treasurer and Mr. George A. Macmillan the honorary secretary, and that the five members of the committee appointed for the year were Professor Gardner, Mr. Gennadius, Professor Jebb, Sir F. Leighton, and Mr. J. E. Sandys, Public Orator of the University of Cambridge. Mr. F. C. Penrose had accepted the directorship for a year, and the school would be opened next November.

A vote of thanks having been passed to the Chairman, in replying he said that he wished he could look forward to pursuing the study of archæology in all its many branches. But in the small space which still remained for him he could only hope to devote himself to two subjects. One was the Corpus of Greek Inscriptions, the third part of which Mr. Hicks was now preparing, and which as far as Priene and Iasos would be issued to the public in a few days. The other was his lectures at University College. During the last year and a half he had brought out a course of lectures on Greek inscriptions, in which the subject was treated more popularly than by Mr. Hicks. He was sorry to say that at his lectures the only habitual attendants were one gentleman and three ladies, and one of the ladies was only seventeen.

ST. MARK'S, VENICE.

THE architect in charge of the work at St. Mark's, Signor Saccardo, has written a letter on his relations with the Society for the Protection of Ancient Buildings. He says :—

I thank you for having called my attention to the publication in the *Times* of London of the protest which the Society for the Protection of Ancient Buildings addressed some time since to the Prefect of Venice against certain hypothetical (*supposte*) alterations with which the pavement of the Basilica of St. Mark's is threatened.

It is a fact that such a protest came some time since to the Prefecture, but it is also a fact that it was found so devoid of foundation (*talmente priva di fondamento*) that it was not considered worth while to communicate it either to me, who have the direction of the work, or to the committee charged with watching it.

It is evident that in this case the good faith of the worthy society in England was deceived by inexact information. But it ought to know that, if formerly there was anything to be said about the restorations of St. Mark's, for some years now—*i.e.*, since the *personnel* and system have been changed—they are carried on irreproachably, so that the most vigorous and outspoken censors of past times have for them only words of praise and approbation.

I do not venture to urge my own name ; but, apart from what they may be worth, the worthy society should know my ultra-conservative ideas in relation to monuments, and especially in reference to the Basilica of St. Mark's, inasmuch as for some years they have prevailed and become known. And that they were known is shown by the fact that the St. Mark's Committee has counted me among its members since October 1880, and from Mr. William Morris having honoured me the year before by a very amiable letter on the part of the society so worthily represented by him.

Returning to the pavement, I do not know what can have given rise to a protest. It is true that in my report on the work done this year in the Basilica and that to be done next year, which was published in the "Archivio Veneto" and in a separate brochure, there was mention made of necessary repairs to be done to that large portion of pavement composed of great slabs of marble which is under the central cupola ; but it is also true that it is added "and this on account of the partial sinking, which seems to be increasing, and which causes frequent and dangerous falls."

Perhaps the word *riforma*, used without any expectation of false (*sinistre*) interpretations in an essay not intended for the general public, may have suggested who knows what alterations? In reality, however, there is only question of putting in their place those large slabs of marble, the support of which being continually diminished, there is danger of the fractures increasing, and in the meanwhile people slip or fall and break their heads.

Certain people believe that the pavement of St. Mark's was originally made unequal purposely to symbolise the waves of the sea. This is a prejudice—a fable. Whoever knows the structure and history of the edifice knows that there was once under the whole a crypt ; that this was demolished and filled up with rubbish without the precaution being taken to demolish the piers and columns which carried the vault, which, remaining upright, offer a resistance, while the earth round them gives way, whence the inequalities and the so-called waves of the sea.

However the matter may stand, no one thinks of correcting this peculiarity of the Basilica ; nor could it be done without the gravest inconvenience of another kind and much more serious, which this is not the place to discuss. But so far as the slabs of marble are concerned these waves never existed, and even of these there is no question of restoring the level (which is, in fact, hardly possible) ; but, as I have said, to prevent the matter getting worse, and that people should not injure themselves. Indeed, there are indications that the ground in certain points is still sinking, and accidents from falling are growing more and more frequent.

I have under my eyes a most sensible circular, dated August 1, 1880, which was sent me in that year by the aforementioned St. Mark's Committee, and which expresses clearly the object of the committee, and the perfect discretion with which it is intended to act for the preservation of our cathedral. Very well. After having proposed to "act with the greatest delicacy, with friendly observation, with the resolution to wound no national susceptibility," it added, very opportunely, "and without noticing simple and necessary repairs." Now here there is precisely question of simple and necessary repairs, with regard to which neither the well-deserving committee nor the most zealous society need have taken the pains to occupy themselves.

THE RHIND LECTURES ON ARCHÆOLOGY.

THE course of Rhind lectures now delivering by Professor Masson, of the Edinburgh University, has for subject "The Social System of Scotland in the Sixteenth Century." Professor Masson's extensive studies in this epoch of history are a sufficient guarantee that the subject will be handled in no exclusive spirit. Dealing in the first lecture with the country and its inhabitants generally in the period, the question of the size and distribution of the population was considered. The distinction of Highlanders and Lowlanders, with the prevalence of surnames in the various subdivisions of the country ; the state of the border clans ; the political unity of the country notwithstanding the turbulence and lawlessness of certain districts, and the reputed poverty of Scotland throughout the century, were brought under notice. The following lecture will be upon the sovereigns and the kingship, the recurrence of minorities among the sovereigns, its effect upon society, and the conception of the sovereign as theoretically the universal landlord in his dominions and head of the Militia system, with glimpses of Court life at Holyrood under James IV., James V., Queen Mary, and James VI. The third, fourth, and fifth lectures will treat respectively of the nobility, lairds, and unlanded gentry, the tenant-farmers, and agricultural population, in which many social features of interest for all time will be brought under review. The sixth lecture will be on the townspeople and the burghs, in which special reference is to be made to Edinburgh as a specimen burgh, with its crafts, guilds, and diversified community.

ASSOCIATION OF MUNICIPAL AND SANITARY ENGINEERS AND SURVEYORS.

THIS Association held its second examination of candidates for the offices of municipal engineers and local board surveyors at St. George's Hall, Liverpool, on Friday and Saturday, the 1st and 2nd instant. The examiners in the various subjects as set forth in the syllabus were, 1st, Engineering as applied to Municipal Work, W. G. Laws, M.Inst.C.E., City Engineer, Newcastle-on-Tyne (past president) ; 2, Building Construction, R. Vawser, M.Inst.C.E., Manchester (past president) ; 3, Sanitary Science, E. B. Ellice-Clark, M.Inst.C.E., County Surveyor, West Sussex (member of council) ; and 4, Public Health Law, J. Lobley, M.Inst.C.E., Borough Engineer, Hanley (president of the Association). Twenty gentlemen offered themselves for examination, and of these the following satisfied the examiners, and will receive the Association's certificate of competency :—E. Sykes, Reddish, Lancashire ; E. T. Beard, Lincoln ; T. Mallinson, Selby, Yorkshire ; R. J. Thomas, Carnarvon ; G. Ball, Scarborough ; Wm. Young, Pendleton ; J. S. Pickering, West Bromwich ; J. A. Crowther, Leeds ; V. H. Turner, Leeds ; M. W. Jameson, Leeds ; C. Brownridge, Leeds ; E. J. Silcock, Leeds. The next examination will be held in London in April 1887, particulars of which will be duly published.

NOTES AND COMMENTS.

The annual meeting of the Glasgow Institute of Architects was held on Tuesday under the presidency of Mr. James Sellars. The report referred to the efforts that the Institute is making for the study of art. Henceforth prizes called "The Glasgow Institute of Architects' Prizes" are to be awarded in the School of Art for the best set of four drawings of architectural ornament drawn from casts in the School of Art; the best set of at least four measured drawings from existing buildings; the best set of lecture notes on building construction. The first competition for the Travelling Studentship, in connection with the Alexander Thomson memorial, will be held next year. It is of the value of 75*l.*, and is open to students of the United Kingdom. Mr. Sellars said that the terms of the competition would be issued very soon, and the benefits would be enjoyed by the successful competitor during the summer of next year. Glasgow hardly knows the artistic treasures it possesses in Mr. Thomson's works. It is to a great extent true of Alexander Thomson, that a prophet is not honoured in his own country, and that a man is seldom known till he is dead. The following architects will hold office during the ensuing year:—President, Mr. David Thomson; vice-president, Mr. H. H. M'Clure; auditor, Mr. John Burnet; treasurer, Mr. T. L. Watson; and secretary, Mr. Wm. Maclean.

One of the most popular prints in France used to be the engraving after Horace Vernet's picture of Napoleon taking farewell of his Guard after his abdication at Fontainebleau. Afterwards Vernet's son-in-law, Paul Delaroche, painted the fine single figure of the Emperor as he deliberated over the sacrifice he was about to make. The abdication is once more to be painted. This time the commission comes from the Emperor of Russia. The artist is M. Berne-Bellecour, who has painted the Emperor seated, and showing the declaration he had signed to his marshals. The room in which the scene occurred was one of those appropriated by the Emperor, which overlooked the Jardin de l'Orangerie. In Vernet's and Delaroche's works little importance was given to accuracy of detail, but M. Berne-Bellecour has sought for garments of Napoleon, and will represent the furniture that existed in the room at the time of the abdication.

Some statistics have been prepared by the waterworks engineer of Bradford, which suggest how much water is wasted in a town of that size. An inspection was made in one part of Bradford comprising 18,774 houses. The consumption of water was 1,821,200 gallons per day of twenty-four hours, being at the rate of 22·47 gallons per head daily. It is needless to say many of the taps were found to leak. After the inspection and repair the consumption fell to 1,163,100 gallons a day, or an average rate per head of 14·35 gallons, the difference in the consumption of the twenty-four hours being 658,100 gallons, or at an average rate of 8·12 gallons per head. But when the calculation was restricted to the dead hours of the early morning, when there is most waste, it was found that the saving amounted to 966,000 gallons per head. In the remaining part of Bradford there was a daily estimated waste of 801,600 gallons. After no more than a partial repair the figures were reduced to 472,800 gallons.

The works at Pierrefonds, which were commenced by the late Viollet le Duc, are being completed under the direction of M. Lisch, who is one of the chief inspectors of historic monuments. The château of the Duc d'Orleans, the brother of Charles IX., was constructed in 1390, and was probably the greatest of the French seignorial palace-fortresses. It was strong enough to resist several attacks, but at length it was demolished by Richelieu's orders. The restoration was intended to be as exact a reproduction of the original building as could be devised with the materials that were available as guides, but the work has not satisfied all archæologists. A portrait-statue of Viollet le Duc is now seen at the entrance. He appears in a pilgrim's garb, with a gourd at his side and shells on his hat. In the principal chamber is a fresco, representing life in the fifteenth century, which was designed by Viollet le Duc.

At the present time there are not many English contracts that can be compared with one for completing the Ribble Navigation and the Preston Docks, which was undertaken by Mr. T. A. Walker, of Westminster. Differences have already arisen between him and Mr. E. Garlick, the engineer appointed by the Preston Corporation. Mr. Walker has asked for the supersession of the engineer, which is a rather novel proceeding. But after considering the subject in private at a special meeting the following resolution was adopted:—"That in reply to the letter of the contractor for the Ribble Navigation and Dock Works to the chairman of the Ribble Committee on the 8th inst., he be informed that the Corporation have every confidence in the engineer carrying on the works and doing full justice between themselves on the one hand and the contractor on the other, and decline to appoint or call in any other engineer, but require the contractor to proceed with the work in accordance with the contract." Any other result could not be expected. Unless engineers and architects are supported there is an end to building organisation.

The Liverpool Corporation have agreed to introduce the following clauses respecting building regulations in the Bill which they are to promote in the next session, viz.:—To require that when any street is laid out as a *cul de sac* it shall be at least 36 feet wide throughout. To prevent any court being laid out which does not at each end open at its full width into a street at least 30 feet wide, and shall not exceed 100 feet in length and 30 feet in width. To allow back streets which are to be paved as carriageways to be laid out at a less width than 15 feet, but not less than 9 feet. To make regulations as to fireplaces, stoves, flues, &c. To require, before the erection of any building is begun, plans and sections of the building to be submitted to the Corporation, and to be retained by them for the purpose of insuring the observance of their regulations and for future reference. To regulate the erection of hoardings in the streets with regard to—(*a*) their position and dimensions, (*b*) the length of time during which they may remain, (*c*) the fees to be charged for the privilege, (*d*) the "making good" or restoration of the footpath. To recover the cost of watching buildings or other property which the owners have failed to secure after receiving due notice of its dangerous condition.

The new Sorbonne in Paris could not do without sculpture, and several commissions have been received for the work. The two pediments are entrusted to M. Chapu and M. Mercié, who will fill them with figures that will typify the faculties of the Sciences and the Arts. The cost will be 60,000 frs. There will be eight figures, each about nine feet high, on the façade, of Literature, History, Philosophy, Geography, Mathematics, Natural Science, Physics, and Chemistry. They are to cost 5,000 frs. each. The ten seated statues will be 7,000 frs. each. In the grand vestibule will be two seated figures of Science and Literature, and in the rector's vestibule a figure representing the Sorbonne itself. On the principal staircase will be six seated figures of Frenchmen who have gained eminence in science and literature. Altogether the taxpayers will only have to pay about 9,000*l.*, and for that outlay they will acquire works by twenty-nine eminent sculptors.

The Scottish Law Courts continue to have the case of the Langholm statue before them. The right of one of the inhabitants to object to the removal of the Malcolm statue was not recognised, because he was not a subscriber to the original fund for the erection of the statue. Four subscribers have been discovered and they protest, but the Courts are opposed to their rights also. Lord Traynor says that the giving of a subscription towards the erection of a monument or statue does not *per se* confer on a subscriber any right of property in the thing erected. He is entitled to see that his money is expended for the purpose for which he gave it. But, that being done, he has no further right in the money given or in the object on which it has been expended. There may, however, be cases where by special agreement or by conditional subscription a right is conferred on the subscribers in the thing subscribed for, whether monument or anything else, but the Langholm case is not one of them.

NEW WESLEYAN CHAPEL AND SCHOOLS, DEWSBURY ROAD, LEEDS.

THIS design was recently submitted in limited competition for new Wesleyan church and schools, Dewsbury Road, Leeds, by Mr. T. Butler Wilson, architect, 12 East Parade, Leeds, and James Street, Harrogate.

DESIGN FOR THREE CUPS HOTEL, COLCHESTER.

THIS design, by Mr. Briggs, is also competitive. The drawing that is reproduced was exhibited this year at the Royal Academy.

FIGURES FROM ST. SPIRIDION, TRIESTE.

THE plate shows part of a frieze painted in fresco by Signor Barzaghi-Cattaneo, who now resides in Paris. A severe character was imparted to the figures in order to bring them in harmony with the building.

MANCHESTER ARCHITECTURAL ASSOCIATION.

THE twelfth session of the Manchester Architectural Association was opened on Tuesday with a conversazione in the lecture-hall of the Athenæum. There was a large gathering of the members of the society and their friends, the company numbering close upon five hundred. After the guests had been afforded an opportunity of inspecting the architectural drawings and models, specimens of decorative art and furniture, and specimens of building materials and construction, which were on view in the hall, the President (Mr. Lawrence Booth) delivered a brief address :—

The coming year, he said, would be made memorable as the jubilee of Her Majesty's accession. An exhibition was to be held at Old Trafford to illustrate the progress made in the development of arts and manufactures during the Victorian era. If that illustration should be made complete, the result would be the most marvellous exhibition the world had ever seen. No half-century, no century, probably no five centuries, could show such a record of real progress. They would probably be subject to the reproach that architecture as a fine art, distinct from the more general application of the term art, had not been enriched by the evolution of any new style that could with propriety be called the Victorian. Unless the "crystal" or glass and iron system of construction could be dignified by such an appellation, of which it could hardly be said to be worthy, they must accept the reproach for what it was worth, always remembering that the true principles of art were "not for an age, but for all time," and could not be invented like a new machine or those thousand and one industrial appliances which in the aggregate had conferred innumerable blessings on the people. Both the possibility and desirability were indeed debatable questions ; and whether in what architects had been privileged to do there were any germs of a new style time alone could determine. Those who were still engaged on the work were too near it to comprehend its proper proportions. It might, however, be fairly claimed for the Victorian era that, owing in a great measure to the initiatory efforts and fervid eloquence of the elder Pugin, it had seen the revival of Gothic architecture ; the resuscitation, for what it was worth, of the Queen Anne style ; and now they were in the throes of a struggle for the reintroduction of the so-called Jacobean. Concurrently with these efforts much that was best in the ancient styles of architecture has been faithfully adapted to the modern and diversified requirements of an exceptionally progressive age. Without wandering far afield for examples, the warehouse architecture of Manchester might be cited in evidence. Given the same atmosphere and other favourable conditions, there were streets in the city whose architecture was not unworthy to be compared with that of ancient Venice. But probably the architect of the period would prefer to base his credentials on the utilitarian and hygienic character of his work—the utilisation of such materials as cast and wrought iron and concrete ; terra-cotta, both as tiles and solid building material ; glass at its wonderfully reduced cost and in its almost unlimited capability of adaptation ; and even such articles as indiarubber and paper for constructive purposes. These, together with a host of "inventions" which the architect could for the most part only claim the credit of having adopted, had almost transformed the utilitarian character of modern buildings. He had, moreover, and none too soon, joined the ranks of the earnest and practical sanitary reformer. In all the essentials to comfort, to a healthy and therefore prolonged existence, the pauper of to-day was better housed than was the peer of fifty years ago—an assertion not less true than startling. Between these two extreme representative members of society there were others for whom much required to be done, and the architect of to-day was a willing co-operator in the good work. Aided, constrained, and sometimes, he was sorry to say, thwarted in his efforts by the numerous local sanitary authorities dotted all over town and country, he was actively engaged in the most beneficent branch of his profession—letting in light and air on thousands who had not hitherto had their proper share of two of heaven's best gifts. There was on such matters still much hesitation to be overcome in places where it should be least expected, and only the few had the full courage of their opinions. So recently as thirty years ago he (the President) industriously designed shutters for bedroom windows, not so much for the purpose of keeping out the burglar as for the exclusion of draughts of cold air, and incidentally the rays of the blessed morning sun. Since that time, and for nearly twenty years, he had slept with the bedroom window wide open, winter and summer, and had not paid the doctor 20*s*. during the whole of that period. Contrivances for blocking up the openings of bedroom fireplaces were gradually disappearing, and the old "four-poster," with its heavy and closely-drawn curtains, would, it might be hoped, soon be relegated to the museum of domestic curiosities. This partial awakening to the importance of a due regard to the laws of health was not confined to any one class. In so far as it increased it would be a valuable auxiliary to the architect's efforts, and be in most gratifying contrast to the supineness of fifty years ago. He trusted that in the arrangements for the illustration of architecture in the Jubilee Exhibition there would be the opportunity afforded of hygienic and utilitarian as well as artistic progress. Some disappointment, founded on the casual reading of the prospectus and the regulations, had been experienced at the apparent omission of provision for the display of architectural work ; but he was happy to say on the best authority that there had not at any time been such an intention on the part of the promoters, and he hoped his professional brethren would be well to the front in the display of what architects had done and were doing for the general good. A vote of thanks to the President for his address, proposed by Mr. Alderman Bailey and seconded by Mr. G. H. Gaddum (president of the Manchester Chamber of Commerce), was heartily accorded. Vocal and instrumental music followed.

ARCHITECTURAL FEDERATION AND THE R.I.B.A. NEW CHARTER.

THE replies to the circular issued by the Architectural Federation Committee are now nearly all to hand, and show over a thousand signatures in favour of closing the profession by Act of Parliament. With so large a response the committee did not think it right that any partial reform, such as that suggested by the proposed New Charter of the R.I.B.A., should be allowed to pass without discussion, feeling sure that if it were to do so it would greatly retard the progress of the greater reform so urgently needed by the profession at large. They have therefore decided to oppose the grant of the Charter, and have invited the Society of Architects to do the same. The latter body have, however, decided to meet the Council of the R.I.B.A. before entertaining the question, both bodies feeling that if the R.I.B.A. would defer their Charter and take the lead in framing an Act, they would achieve their object with rapidity, and raise themselves to the position they ought to occupy in the architectural profession, from which they have hitherto lamentably fallen short.

MR. RUSKIN'S MUSEUM AT SHEFFIELD.

RECENTLY communications have been passing between Mr. Ruskin and the local authorities of Sheffield with a view of obtaining some of the property of the St. George's Guild placed in Meersbrook Hall, Meersbrook Park, thus giving to all sections of the inhabitants ready access to some of the valuable treasures which that Guild possesses. Mr. Ruskin intimated his readiness to consider the question, thus conferring a new favour upon the people of Sheffield, although it was clearly intimated by him and quite understood by the authorities that none of the contents of the Walkley Museum were to be removed. The only other condition imposed was that any of the property of St. George's that might be placed in Meersbrook Hall would be liable to removal at any time. A day or two ago the Mayor wrote to Mr. Ruskin stating that he quite

understood this condition, and gratefully appreciated Mr. Ruskin's kindness in consenting to consider the placing of a portion of the property of St. George's at Meersbrook, a boon which he was sure would be most thankfully accepted by all classes of his fellow-townsmen. The following letter has been received by the Mayor:—"Brantwood, Coniston, Lancashire: October 15, 1886.—Dear Mr. Mayor,—I am entirely happy in the frankness and fairness of your letter, to-day received, and do not need to see the plan of the museum, but will at once begin the arrangement of a series of drawings, which may be placed anywhere so only that they have enough light well guarded; and a series of minerals which, if not equalling the Walkley ones, will be more generally useful. Nor shall they be taken away again unless the smoke or any other influence is visibly injuring them.—Ever faithfully yours, JOHN RUSKIN."—In another letter Mr. Ruskin says he will at once send the first instalment of minerals and the drawings, to be kept in the town hall, or wherever else it may be thought desirable, until the Park Museum is ready for them. He also states that every stone and every drawing will be catalogued when sent, with a sufficient description.

HAUGHMOND ABBEY.*

IT may not be amiss briefly to recall to our minds some of the characteristics which belong to the other three abbeys lying near to the foot of the Wrekin; to facilitate this, we may glance at the several plans which were made use of on the occasions of our visits to them. In the Cistercian house at Buildwas, dedicated to the Blessed Virgin, as all their churches were, the remains show in a very marked manner the grand simplicity which distinguished all they did—thick walls, low, massive piers, broad and simply-treated arches, and details of noble proportions. At this abbey the church and chapter-house form the principal part of the ruins; some of the domestic buildings have been turned into a gentleman's house. Lilleshall was a smaller house than Buildwas, and belonged to the Order of Austin Canons, and there the church again forms the main feature of the present ruin, but the remains of the domestic offices on the south side of the cloister are still extensive. That church was without aisles, and its sub-divisions are numerous. It is of later foundation than Buildwas, but the early parts of its work are very minute and beautiful. Very few changes were made in the buildings even at Lilleshall, and at Buildwas scarcely any alteration had occurred.

The Cistercians had no love of change, and as their rule remained unaltered, so did their ambitions.

The mighty works at Wenlock, built by the Cluniac Order, were far the grandest of these four abbeys, and there, again, the remains of the church are much the most extensive. They show more than usual changes during the occupation of the monks, as may be seen in the large lady-chapel at the east end of the church, and the prior's lodgings to the south. At this place also a gentleman's house has been formed out of the abbey buildings. It will be noticed that of the four abbeys referred to, three of them have the church to the north, with the conventual buildings to the south, whilst at Buildwas this arrangement was reversed, the church being to the south. No doubt the "lie of the land" and the position of the river at Buildwas dictated the change in this respect, but though their buildings were north of their church, they contrived to get southern fronts to some of them, as is seen by what remains of the prior's house and infirmary. But it is time we turned to our more immediate subject, directing our attention closely to these remains at Haughmond.

First of all, it should be said that the whole history of this place, so far as it has come down to us, is fully known, and may be read in the county histories, and in the Salopian guide-books by the late Mackenzie Walcott, published by Messrs. Adnitt & Naunton, of The Square, Shrewsbury. Next it may be pointed out that there has been a time when opportunities were better than now for getting a clear view of certain foundations which had been laid bare by excavations, but which are now more or less covered by vegetation or otherwise. Then, the descriptions of the buildings given by Mr. Walcott are patent to every one. So it must be at once said that perhaps there is nothing new to be told in respect of these buildings. It is, therefore, a mere matter of examination that is left to us. To this let us now proceed, first premising that the priory was founded between 1130 and 1138 by William Fitz-Allan for the Austin or Black Canons, and in 1155 was raised to the dignity of an abbey. It had many benefactors, and at the dissolution was valued at about 260*l.*

The present approach to the abbey is on the western side, and the buildings on the western front present an extensive range. To the north is a long blank wall of considerable height, which originally formed one side of a large block of buildings to the west of the cloister square. Then comes a gable end with a central arch, now the principal entrance to the premises, with an arch on each side, filled in with masonry. This is said to have been the refectory with an "undercroft;" next, a length of wall broken up by two large projections, which formed the kitchen fireplaces, and at the southern end the gable of a building flanked by turrets, which now forms the most prominent feature in the ruins, and said to be the infirmary. At the extreme north of this range stood the church, the southern wall of the nave of which in part still remains.

The outline of the church may be tolerably well made out from excavations which were made some years ago. It seems to have consisted of a nave with a north aisle only, with a projection to it near the west end either of a porch or tower; transepts, with eastern chapel or chancel. The foundations of the west end of the church are traceable; also some of those of the south transept, and in a degree the rough mounds appear to indicate the general outline of the building. The doorway on the south side of the nave from the cloister is complete, and in the south wall are the remains of a later doorway inserted near to the original one, and at about the centre of this wall the lower part of the side of a recess is visible. Two flat gravestones on the south side of the floor of the choir are still preserved and carefully railed off. They are dated, and bear inscriptions given by Mr. Walcott. To the south of the church is the cloister square; to the east of it is the front wall of the chapter-house, with its three elaborate openings; to the north the enriched doorway in the south wall of the church; to the west the long wall, which originally flanked a western range of buildings, and in it at the north end are two doorways, one blocked up and the other converted into a window-opening, in times much later than the original building. At the south end are two lofty arched recesses which have been called the "lavatories;" but there has been a doorway in each recess, and at present there are no indications of lavatory troughs or drains. The importance of these features hardly point to their use as lavatories, not that very beautiful work has never been employed for this purpose, for such is seen at Wenlock and elsewhere; but the loftiness of these arches is not consistent with the strong sense of appropriateness which characterises all early architecture. These points lead me to demur to the dictum assigning this as the place for ablutions. The west and south walls of the chapter-house are its only ancient ones, and they bear signs of a vaulted roof. In the floor may be seen a stone coffin built of a number of stones. A cover stone, if placed on this coffin, would be useful. To the south of the cloister square are considerable remains of what has evidently been a two-storeyed building, the main floor being entered by the fine doorway now remaining at the cloister level. No doubt this has been correctly named as the refectory, which invariably was entered from the cloister, and generally by a doorway of importance like this, which is a very fine example. The remaining features of the refectory point to a large and nobly-proportioned room with wide and lofty windows, as seen by those on the south side and the arcading in the south-west corner. It is seldom that the refectory is placed on the first floor, but it is evident that in this case the ever-varying levels of the ground have dictated it.

Taking the floor level of the church as being fixed, together with the desire that the cloister should be of one level, it is clear that the natural level of the ground on the southern side afforded height for a basement floor, which the ever-present ingenuity of the early builders failed not to avail themselves of. The varying forms of the arches employed in the front gable of this building is noticeable. In a very short length of wall the pointed, segmental, and semicircular arch are all used, and that in a manner dictated by common sense and the particular requirements of each opening. This block did not extend east and west the full width of the cloister square, for there are not only the remains of foundations showing its eastern end, but also distinct evidences of there having been a groined passage-way between it and the eastern line of the cloister buildings. This passage would connect the cloister square with the smaller court southward. The springers in this passage and a short length of groin shaft on the inside of the northern opening of the chapter-house are the only indications of groined ribs about the buildings. In a line with the western side of the chapter-house there runs southward an original wall of considerable length, and to the east of it there are indications of this wall having formed the western flank of an extensive range of buildings, and several remaining doorways in this wall point clearly to the same fact. The published plan defines such buildings as "the dormitory, with undercroft." Still further eastward of this range the position of the "Abbot's Lodge" is suggested, but the actual evidence of the appropriation of these buildings is not very strong. High up in the south wall of the chapter-house an original doorway, with an external staircase, are plain enough, and this rather points to a difficulty of direct approach to the church from the monks' dormitory, which was a very general rule. Here it may not be out of place to suggest that the monks

* A paper by Mr. C. Lynam, F.R.I.B.A., read on the occasion of a visit to the ruins.

dormitory might very well have been over the western range, as at Durham, and this would give point to the doorways at the north end of this range opening into the cloister, and also explain satisfactorily the position of the doorways on the south side of the church, which at Buildwas, Lilleshall, and Wenlock are opposite the eastern walk of the cloister, and not the western, as here.

Up to this point all the buildings are of the same date—that is to say, the church, the chapter-house, the refectory, the western cloister block, and the range running southward from the chapter-house are all unmistakably of twelfth-century architecture, but the remainder of the buildings are of later date. To the south of the refectory is what has been termed the "Base Court," a term adopted from the French monastic arrangement. To the west of this open court the cottage of the present abbey-keeper is placed, which erection has been made up for the most part of fragments from the original buildings; and on the outside of its western wall are two huge projections, which are said to indicate the kitchen fireplace, but this part has been so much altered and interfered with that its present condition does not very clearly declare itself.

Flanking the south side of the "Base Court" runs a very important line of buildings, the most perfect of any of the remains. This has been one great hall, with two entrances from the base court, two at the east end, two to the west, and a garden entrance in the south flank. Its windows have been admirably planned, not only for the admission of light and air, but for the enjoyment of the prospect without, as the seats in their recesses testify. The west end has been screened off; a passage has run between one stair turret and the other, which still exist at the angles of this building, at the west end. This hall is but of one storey in height, and a very noble apartment it must have been. The published plans assign it to the "Infirmary," and no doubt the monks took care of those of their number who from age or infirmity were unable to perform the round of daily task and nightly vigil, which the young and strong of their house had to perform, and no doubt monastic infirmaries were buildings of no mean order; but then, as with the other arrangements, so with this—they were strictly appropriate to their purpose, pleasantly situated away from the traffic and bustle of the general house, and having nearly always a chapel either within or adjoining. These were the usual accompaniments of a monastic infirmary. But who can say that they are present here? This hall is pleasantly fixed with its low-silled southern window no doubt. But then others than the infirm might well covet that advantage. All the other characteristics of the place point rather to the seat of entertainment than of repose, and it may well be that the abbot of this great house made this the hall of entertainment for his guests. In considering this suggestion it should be borne in mind that this building was erected at least two hundred years after the original works, when perhaps the possessions of the abbey had not yet grown less, and when it may be that the first strict rules were not absolutely sustained.

There is one small matter in connection with this building which is not without interest. It will be remembered that at Abbey Hulton the monks were almost convicted of having taken the gravestones of their earlier brethren and made use of them for the floor of a drain from their kitchen, Such was the position many of these stones were found to be in, but then the fact was covered by the possible excuse that a "scamping" builder might have put them there unknown to anyone; or it might be that an "Irish labourer," so to speak, had laid hold of them and put them unseen in the trench of the drain; but here all excuse is unavailable, for there is the fact that in one of the stone treads to the north-west angle turret of this building a former gravestone or coffin-lid has been made use of, mutilated, and brought to shape for its present purpose; so we see that hundreds of years ago a "society for the protection of the memorials of the dead" might even then have been useful, and that amongst a class of men we should least expect to have required it.

The great fireplace on the north side of this apartment is, of course, of much more recent date than the building itself. At the north-east angle of this room is a stone staircase, which leads to the upper floor of the long building running north and south at the eastern end of this hall. This building has been altered to such an extent as to make it difficult to unravel its puzzling fragmentary state. If the suggestion that the building which has been called the infirmary was in reality the abbot's hall, this range of buildings was most likely his private quarters. In modern times it seems to have answered the purposes of both kitchen and parlour, and it appears probable that originally it contained the offices required for service to the great hall. Its southern end projects into the original sunny gardens of the monks or abbot, parts of the ancient walling of which still remain. Having got to the brightest side of this venerable establishment, we might perhaps not inaptly close our inspection; but there are one or two further general points which should be noticed. The burial-ground was probably to the far north of the church. The walls are generally built of rubble from the rocks on which the establishment is built; the dressings are of, perhaps, Grinshill stone, and to this day bear the marks of the mason's tool and of his own distinguishing sign. The water supply came from a conduit in the wooded hillside to the east, and it is said that the fishponds lay in the valley to the north, whilst the entrance-gates, with their chapel and almonry, were to the west.

THE YARMOUTH TOWN HALL.

At last week's meeting of the Yarmouth Town Council the subject of the town hall was once more brought forward.

Mr. Wiltshire, in moving the adoption of the Works and Repairs Committee report, said the main feature was of great importance, for it was the question of the rebuilding of a portion of the town hall or its removal to another site. There were four courses that seemed open to the Corporation. First, the rebuilding of the hall on its present site, and the majority of the committee were in favour of this; but there was one point in this, and that was as to whether any one would guarantee the work. No one could do so, although Messrs. Bottle & Olley's reputation would be at stake. To take the town hall elsewhere would involve a very great deal of expense. Another suggestion was to remove the assembly-room from its present site, or to erect a lighter one. Then it had been proposed to hold a meeting of the ratepayers; but he thought the Council, as the representatives of the ratepayers, were capable of dealing with the matter. He regretted to say that the settlements in the town hall continued, and it was a matter the Council should deal with at once.

Mr. F. Danby Palmer moved as an amendment:—"That, having regard to the fact that the ratepayers of this town have grievously suffered in consequence of the resolution passed by them in public meeting assembled on April 20, 1878, not having been properly and duly considered by the Town Council, it is not now desirable to proceed with the work of repairing or rebuilding the town hall until another public meeting of such ratepayers had been held to consider the subject."

On a vote being taken, it was found that five members voted for the amendment and twenty-nine against. The report was adopted.

The following resolution was afterwards adopted:—"That the committee recommends the Council to pull down forthwith the west portion of the town hall according to the plan of Messrs. Bottle & Olley, and that no contract be entered into for rebuilding until further consideration by a committee of the whole Council."

Correspondence

French Architects and their Responsibility, &c.

Sir,—It is not agreeable to have to deal with a writer who cries *peccavi* and begs to be let off on the score that he is compelled, in spite of himself, to be inoffensive during eleven months of the year—for, in a few words, that seems to be the meaning of the beginning and end of Mr. White's last epistle. I am not insensible to an appeal of the kind, and as I consider Mr. White has been humiliated enough for his escapades in the fields of history and language, I would gladly overlook him. But I consider it incumbent on me, as the cause of the offence, although unwittingly, to take the earliest opportunity of protesting against the indecorous attack on Her Majesty, which Mr. White has introduced in his reply to me. A week or two before, when commenting on my article, Mr. White ostentatiously referred to his loyalty. Why that was done was not apparent at the time. It is evident now that it was simply a means to give more force to the blow that was impending. Why should Her Majesty in person be rebuked because the Academicians will not set up professorships and lectureships to gratify Mr. White and his little band of friends? The offence may be very grievous, but the old English principle, "the King can do no wrong," is surely wide enough in its application to cover a case of that magnitude. Even if we assume that it does not, still, what must we think of a man who selects a time when all subjects are about to unite in paying a tribute of respect to their Queen, as an opportunity for writing in 'Ercles' vein after this fashion?—

"If the Royal Academy is still injuring, from a professional point of view, both sculptors and architects, let us not forget that the injury is inflicted with the personal approbation and sanction of the Queen's Most Excellent Majesty."

The charge is so groundless and unworthy that I cannot suppose it will be permitted to pass uncensured by the members of the Royal Institute of British Architects, who have the privilege of wearing the Queen's Cloth. It is also deserving of

reprehension by the Council of the Institute. A society that boasts of being under the royal patronage should show its gratitude by exacting loyalty from its officials in their public utterances.

I also trust that Mr. White's words will open the eyes of architects both in and out of the Institute, and suggest the extent to which the men who are eager to revolutionise English architecture are prepared to go for "the cause which they have at heart."

Here my letter ought to end, but on second thoughts I will ask the reader to bear with me while I say something on the condition of architecture in France, since Mr. White has made a show of replying to what I suggested on the subject. He tells us that architecture in England and France cannot be compared, and then characteristically he sets about a comparison. Mr. White makes some novel discoveries, which may be summarised as follows :—

Paris.	*London.*
The architect in Paris practises architecture pure and simple. He is absolutely an art architect.	The English architect is a house agent, surveyor, valuer, &c.
He is the master of his contractors.	
He is their social and artistic superior.	He is the inferior of the "eminent contractor."
He is, as of old, the master of the work.	
He is better trained and more highly respected than the Londoner.	He is paid more and does less work than the Parisian.

Here again we can observe the power of Mr. White's sense of what is apposite. To decry the existing practice of architecture in England, he selects a time when the Institute is presided over by a representative man who has worthily acted already as President of the Surveyors' Institute. Now, sir, when people talk of pure and simple architects, they forget the history of architecture. In the best periods architects were prone to undertake any worthy kind of work that related to building. If Philibert de Lorme was not only an architect but a contractor (and so much was he to the manner born that his contemporaries doubted his honesty in that capacity), why should not a less able artist be allowed to measure, value, or sell a building when he is invited to do so? Many French architects act on the principle, and believe it is not necessary to be hoity-toity in the selection of work.

It is only necessary to use one's eyes to obtain evidence. A Cook's tourist, as he is whirled through the streets of Paris, can hardly fail to be reminded of home by the enormous canvases on vacant building sites announcing that particulars are to be obtained of M. So and So, Architecte. If the tourist can find an opportunity to escape from his watchful guide, and will stroll about the streets, he has only to look into the first house-agent's shop to see drawings and photographs of several examples of that class of house which is suggestive of a highly-developed state of speculation, and he will find, as in London, that every agent has his favourite architect, or the architect has his favourite agent. If the tourist be of an inquiring turn, he will have little difficulty in hearing of French architects who do not wait for commissions to come to them, but, like city architects, work on the financial sense of mankind, and make the commissions be created for them. There is much before him to suggest that the French architect is not unlike his English brother in having a desire to gain money to pay his way. Our tourist will even discover that if the "eminent contractor" does not abound, the "speculative builder," who is near akin to him, flourishes in the land, and is duly respected by architects. The tourist has only to turn to the last book of the realistic novelist, and he will be enlightened about the relation of Parisian architects to men of that class. A few words like the following will reveal a good deal to him :—"Avant-hier, j'ai découvert un architecte qui travaille pour un grand entrepreneur. Oh! non, on n'a pas idée d'un architecte de cette ignorance : un vrai goujat, incapable de se tirer d'un décalque ; et il me donne vingt-cinq sous de l'heure, je lui remets ses maisons debout." Should the tourist imagine that he might do "a little business" with some production of his own if he knew such an architect, he has only to go to any of the great ateliers, and with tact he will discover that many of the best and most ambitious students, who are trying to get on the road to the Institut *viâ* Rome, are willing to turn aside and give their best skill to the speculator and his architect for an equally modest stipend.

I am not suggesting that every architect in France is connected with a speculator. That would be as absurd as to lead young folks to suppose that all the French architects are pure and simple, with rosettes in their button-holes, and a legion of contractors kneeling before them. In all countries the conditions under which life is carried on are pretty much alike, and everywhere architects have to accommodate themselves to what is about them. Nor can I see that architecture suffers by bringing an architect into a close relation with life—which nowadays means buying and selling. I doubt if the City of London can show a building that would be more pleasing to the eyes of a French artist than the Bible depôt in Queen Victoria Street, which is the work of an architect who is not above surveying or letting a plot of ground. On the other hand, there is a risk that the pure-and-simple architect may forget the susceptibilities of the flesh among common folks. May I not say that Mr. White was disabused of some of his prepossessions when, on visiting Cardiff Castle, he discovered that "art" did not necessarily mean tightly-fitting windows and doors and other conditions of the comfortable?

It is natural that Mr. White, with the pure and simple in his mind, should see nothing remarkable in the enactment to which I alluded, and by which French architects are held responsible during a long term of years for the stability and independence of repair of every building they designed. Apparently he considers that, like an aristocratic variety of gout, it is a proof of descent, and they ought to be proud of it. They are the representatives of the masters of works—that is, of the fine, mysterious fellows who play so important a part in some modern imaginative disquisitions on Mediæval art. Unfortunately the French architects are not sentimentalists, like Mr. White, and they think more of the monetary meaning of their liabilities under the Code than of the prerogatives which responsibility confers. "Nous vivons constamment," says one honest architect, "avec l'épée de Damoclès suspendue au-dessus de notre bourse et de notre liberté parfois," and physiologists would probably conclude that the bald heads which are so remarkable a phenomenon in an assembly of French architects, are owing to the constant apprehension that the sword is about to fall. There is not, I believe, an architectural society throughout France that has not tried to get rid of a liability that in most cases is inequitable. So much has been said and written on the subject, it would be rash for any one to say they have read all the reports. But I have no hesitation in defying Mr. White to produce an authoritative document by which the French architects recognise any right to be held liable from their relationship with the masters of works. In France logic is taught generally, and as there is no evidence of the duties, responsibilities, or rewards of the Mediæval officers, a French architect wisely refrains connecting himself with them. What was a master of works? Judging from the archæologists' explanations, the phrase is so elastic that it may be taken to mean anything and everything. Language with that quality is dangerous to meddle with in a case of damages.

There is one reason which upsets the master of works theory. If the responsibility had been founded on it, then it must have been continuous from the Mediæval times to the Revolution. But the remarkable fact is that the pure and simple architect was free from the ten years' liability prior to the promulgation of the Civil Code. This is evident from the most interesting commentary on the ancient "Coutume de Paris," by Antoine Desgodets. There we read how the master masons and other artisans were responsible during ten years for any fires which might arise through defective construction, how the contractors, masons, and carpenters were responsible during ten years for the edifices they constructed, how other workmen were responsible for a single year, and so on. The owners and tenants had likewise responsibilities. But not a word appears about the responsibility of an architect acting as designer or superintendent of works. If architects are referred to, it is merely as experts in case of dispute, for Louis XIV. appointed twenty-five of them and twenty-five contractors for masonry to act as *experts jurés*. Desgodets, it will be remembered, was one of the *protégés* of Colbert, who sent him to Rome in 1674. Afterwards he lectured on building law, among other things, and is an undoubted authority on what was enforced in his time.

Under the Old Régime, architects, like other worthies, were able to escape from the consequences of their incapacity or neglect. This is plain from the notorious case of Claude Perrault, the "méchant médecin," who is gibbeted by M. Boileau and extolled by Mr. White. He was guilty of the most extraordinary blunders in the Louvre, some of which had to be remedied at great cost, while some were irremediable ; but there was no attempt to make him refund the money he misspent. It can be supposed that ex-students of the Académie Royale d'Architecture would not fail to bring forward so remarkable a precedent to safeguard them against any liability for defects in their own buildings.

One thing seems certain, that prior to the time when the Code was formalised the architects enjoyed immunity from responsibility. Then a new state of things was created. It is reflected in the humble work of the index-maker. Look at the index of a treatise on the "Loix des Bâtiments," published before the Revolution. Several references will be found under the head of "entrepreneur," while the word "architecte" is ignored. Then take up one of the early editions of the Code, and on turning to "entrepreneur" the reader sees "V. architecte," and he discovers that the Codists made no difference between the two classes. Henceforth the architects were to pay the penalty of their old privileges by the terrible clause No. 1,792, which

haunts many minds :—"Si l'édifice construit à prix fait, périt en tout ou en partie par le vice de la construction, même par le vice du sol, les architectes et entrepreneurs en sont responsables pendant dix ans." The old masters of works must pity their nominal successors who have to work under such conditions. No wonder so many are prematurely bald.

Mr. White must have known all this when he wrote about the responsibility as if it were a becoming arrangement. I can only explain the anomaly by the supposition that the passage was dictated by the gentleman who exercises the office of Mentor towards Mr. White. Doubtless there are other difficult passages in his letter that could be traced to the same source.

Mr. White professes to be unable to understand why I should have introduced the subject of French responsibility when French education is under discussion. The two are closely, I might say, inseparably united. Why did the Codists insist on putting architects in so perplexing a position? One writer says it was through ignorance, another through prejudice, and various explanations have been offered. I maintain that it was owing to the architectural education that was given in the days preceding the Revolution. Then, as now, incompetent men were let loose from the official school to practise architecture. It was impossible to dispense with the system of education, for whatever may be the form of government, a corps of artists must be provided for its glorification, and a reform of the system was difficult. But a check was devised; bane and antidote were put together. Men without practical knowledge were allowed the opportunity of setting up as architects, but the liberty was accompanied by the liability for every defect that should occur above and below the ground. It is not even stipulated when redress is to be sought from the unlucky architect, and an owner can allow the defects to be aggravated by time and neglect as long as his claim is within the stipulated period. If architectural education in England should at any time assume the French form, the safety of the public will demand a similar clause; while no legislator would attempt to have the obnoxious clause struck out of the French Code, or amended, until some system with the good qualities of English education is introduced in France.—Your obedient servant,

THE WRITER OF THE ARTICLE ON "THE ROYAL ACADEMY AND EDUCATION."

The Barony Church Competition.

SIR,—After abstaining from competitions for many years, I recently accepted an invitation to engage in a limited competition for the new Barony Church in Glasgow, as the chances of fair play seemed exceptionally good. I have been unfairly dealt with; and as I think my experience in this case may be instructive to others, I send you a short account of it, and illustrative correspondence. Since the committee intimated their decision, now four months ago, I have been vainly endeavouring to get from them such information as would enable me to judge how far they had disregarded their own conditions; but they have persistently refused to give any such information, and I regret to say that their conduct in this respect has been approved—at least so they assert—by Mr. J. L. Pearson, R.A., who acted as their professional adviser. Having been informed on excellent authority (the testimony of well-known Glasgow architects who had seen all the designs) that the conditions had been grossly violated,* I first appealed to the committee and to the clergyman, Dr. Marshall Lang, personally on the subject. Receiving from them only evasive answers and assurances that they were not at liberty to show me either Mr. Pearson's report or the report of their own surveyors, I next appealed to Mr. Pearson himself, who declined to give me any answer whatever! (I enclose a copy of this correspondence.) My next step was to hand the matter over to my law agents, who tell me they have exhausted every means of having the matter settled extra-judicially, and that they have now received a final reply from the agents of the church declining to give any information or to continue correspondence further. (I send you this letter and two which preceded it.) Before deciding on further action I think it is right to give our professional journals, and members of the profession generally, a statement of the issues involved, and to invite an expression of opinion as to their importance or otherwise to the profession. If the committee in this case are allowed to have their own way, we shall have precedents established for the three following things :—

1. That in a competition where the total expense is strictly limited to 13,000*l.* competitors are at liberty to submit to the committee designs costing 16,000*l.* or 20,000*l.*, or indeed any sum they please so long as they also submit along with these drawings showing how much of them can be done for 13,000*l.*; or, alternatively, so long as they state in their report that part of the design they submit must be omitted if the stipulated sum is to be adhered to.

2. That in a competition where the cost is strictly limited, and where it is a condition of the contract between the committee and competitor that a surveyor shall be employed to report upon the designs, "so that they may be compared on a uniform basis as to cost," a committee is justified in refusing to give a competitor who challenges the justice of their decision any information whatever as to the grounds on which that decision is based, or to show him the reports or extracts from the reports of their professional adviser or their surveyor bearing on this point.

3. That in such circumstances a professional adviser is justified in refusing to give the aggrieved competitor any information; in withholding his report, or so much of it as bears on the point at issue; and, practically, in combining with the committee to keep the whole transaction dark.

If you will take the trouble to wade through the correspondence which accompanies this, you will see that these are the points involved. I have made them, I think, perfectly plain both to the committee and to Mr. Pearson, who have acted so far as if they were ashamed of themselves, but with an unwavering determination to refuse more light.

I ought perhaps to mention that Messrs. A. J. & A. Graham, who wrote the letter dated September 28, are lawyers of good repute. This seems the more necessary as their succeeding letter, dated October 4, is, so far as it relates to the point at issue, simply untrue. They say that I have received all information necessary to satisfy me of the justice of the committee's decision, and the fact is that I have not up to this date received one single atom of information from the committee. The questions asked in my first letters of June 16 and 28 remain unanswered, as Messrs. Graham must know perfectly well. In these I ask for the only information which could possibly satisfy me or any other person interested in the committee's decision, and it is still denied. The committee and their advisers have been at least consistent in this, and I hope their conduct may receive the public recognition it deserves.

I shall be much interested to know what the members of the profession think of the three points mentioned above. To me they seem important, and not matters to be left in doubt.—Your obedient servant, JOHN HONEYMAN.

Glasgow: October 15, 1886.

* My information was to this effect :—(1) That it was manifestly absurd to suppose that any of the designs placed in order of merit above mine could be carried out in their complete form, as shown, for the stipulated sum. (2) That the surveyors' report bore that the designs of Mr. W. F. McGibbon and myself could be carried out for the stipulated sum, but that the authors of all the others placed higher in the order of merit had violated the condition as to cost, some of them flagrantly. This being so, my anxiety to see the reports (which are still withheld) can be easily understood.—J. H.

The Late Mr. E. W. Godwin, F.S.A.

SIR,—At a meeting of the Council of the Society of Architects held this evening, a motion of regret at the loss which the architectural profession has sustained in the death of so distinguished and talented a member of it as the late Mr. E. W. Godwin was proposed by the President, Mr. H. R. Gough, seconded by the senior Vice-President, Mr. J. J. Lish, and carried unanimously. We should be glad if you would give this publication.—Your obedient servants,

EDGAR FARMAN, Hon. Secretary.
G. A. T. MIDDLETON, Secretary.

5 Great James Street, Bedford Row, W.C.:
October 15, 1886.

Elland Town Hall Competition.

SIR,—I write to call your attention to a few facts in connection with the above, as advertised recently in your columns. Wishing to obtain particulars, I wrote on October 7 but failed to get an answer. I waited patiently until the 15th, when I ventured to send a gentle reminder. To this I received a short reply, stating that the particulars were exhausted, and it was thought (?) that there was scarcely time to prepare designs, seeing that they must be delivered by the 6th proximo. After writing again, saying that I still thought there was ample time, and wished still to have particulars if possible, at length, on the 19th, I was allowed a copy of the precious document which had, as a great favour, been specially prepared for me.

Let me give you a specimen of the generosity and respect for the architect's profession displayed in the printed conditions. The fortunate man whose designs are selected is to receive a commission not exceeding 4 per cent. on the work, inclusive of quantities! He is allowed to state his commission, so, if generously disposed, he need not take advantage of such heedless liberality, but he is expected to include in his charge "all information required by the contractors." I may further mention that the directors "reserve to themselves the right of making any alterations they may deem necessary in the selected plans." Now, seriously, Mr. Editor, what are we coming to when public competitions are sinking to such a level, and what

will the profession of an architect and his status be worth ten years hence, if this sort of thing is allowed to increase? And, further, what will be the type of the public buildings by which our towns are to be disgraced—though not permanently, let us hope, as the work done by those with so little respect for themselves and their profession generally does not last very long to repel by its ugliness, and swell the death rate by its unsanitariness.—I enclose my card, and remain, yours very truly,

October 20, 1886. INDIGNANS.

Damp Spots and Water-Colours.

SIR,—It is impossible to give any suggestion to "Collector" unless he supplies more particulars about the drawings. Are any of the colours opaque? What kind of paper is employed?—Yours, &c., COLLECTOR II.

The Pavement of St. Mark's.

SIR,—It is just possible that the builders of St. Mark's deliberately made the pavement wavy in imitation of older pavements, but it is very unlikely. It would have been a queer joke for the workmen. All older mosaic pavements, whether in the Baths of Caracalla or any Roman villa in Britain, exhibit the same peculiarity in greater or less degree. It is doubtless partly owing to eccentricities of natural drainage, and partly to the action of earthworms. Darwin, in his book, gives statistics of the amount of movement of earth through the mosaic floor of the small villa at Albury. All these floors are laid on a very thin bed of lime on the top of the natural soil, and there is none of the rigidity of concrete.—Faithfully yours,

Guildford. RALPH NEVILL.

CHURCH BUILDING AND RESTORATION.

Manchester Cathedral.—Mr. Crowther has commenced what promises to be, when completed, another great improvement in the cathedral restoration. This is cleaning off all the plaster and cement which has for many years hidden the beautiful original masonry in the Derby Chapel and Ely Chapel on the north side of the chancel. A similar work is being carried out with the spandrels and piers of the outer northern aisle of the chancel. In regard to several mural monuments (among them that of the Rev. John Clayton, the "Jacobite" Fellow and friend of John Wesley, and those of Anne Hinde, Dauntesey Hulme, George Lloyd, &c.) which have been temporarily removed while the work has been going on, we are informed that suitable places will be found for them when the restoration of this part of the cathedral is completed.

Edinburgh.—The memorial-stone of a new United Presbyterian Church, South Morningside, has been laid. Mr. G. Washington Browne, of Edinburgh, is the architect.

Tallaght.—The church erected as a memorial of the well-known Dominican priest, Rev. Thomas Burke, has been consecrated. The building has been erected by Mr. Meade, the architect being Mr. Ashlin, of Dublin.

Sutton-in-Ashfield.—The foundation-stones of a new church have been laid. The contract for the work was taken by Messrs. Morgan & Cowper, of Campsall, Doncaster, at 1,505*l.* Mr. J. Fowler, of Louth, is the architect.

Netley.—The new church of St. Edward, Netley Abbey, which has been built from the designs of Mr. J. D. Sedding, of Oxford Street, London, has been opened. The builder was Mr. Bone, of London.

Stonham Parva.—The chancel of Stonham Parva church has been restored. Mr. G. Nevard, builder, of Nayland, carried out the work from the designs of Mr. E. F. Bisshopp, diocesan surveyor.

Workington.—The new free Presbyterian church has been opened. Mr. James Howes, of Workington, was the architect, and Mr. Beattie Towers had the contract for the building. The sub-contractors were:—For the joiner's work, Mr. W. Carruthers; painting, Mr. Sherwood; and plumbing, Mr. D. H. Walker.

ARCHÆOLOGY.

Aston Hall, Birmingham.—In pursuance of the policy of displaying to the best advantage the architectural and antiquarian features of the building, an interesting restoration has just been made at Aston Hall, under the direction of Mr. Rodway, secretary to the Baths and Parks Committee of the Borough Corporation. The kitchen, which is situate at the north-west corner of the hall, and which for some years past has been closed to visitors and used as a lumber-room, has been cleaned and painted, and a large portion of the old cooking apparatus has been placed in position. The dogs have been replaced in front of the enormous fire-grate, and the smoke-jack which turns the spits has been put in working order. Several of the old spits, including those used for roasting different kinds of carcases whole, have been fixed on the dogs or hung at the side of the fireplace ready for use. At the side of the fireplace is a kind of cooking-range, probably one of the earliest patented inventions of its class. It is labelled "John Slater, patentee." Near at hand are the ovens in which bread, and probably pasties, used to be baked; while at the other end of the kitchen is a large "hot plate" for pots and stewpans. The windlasses, which probably have served to lift the carcase of many a fat deer, have been restored. The fire-irons have been brought out, and the sets made up by having the missing parts made in similar style. On the wall are hung the heads of the stags fed in the park, a huge tortoise-shell, and other appropriate relics. The old mortars are missing, but two stone balls which served as pestles are to be seen, and at one side of the room stands the old chopping-block. The old kitchen clock remains where it has been for some years, in the entrance hall facing the principal door. Some of the modern fire-extinguishing appliances are hung in the kitchen for convenience of access, and it may be noted in this connection that additional apparatus has lately been purchased, and that the employés in the hall and park are drilled weekly by Superintendent Tozer, of the Birmingham Fire Brigade. Over the fireplace of the kitchen a painted shield, dated 1635, and bearing the arms of Holte impaling those of Bradbourne, has been restored under the personal direction of Mr. Rodway. The whole of the work has been done as part of the ordinary work of the Baths and Parks Department, and involves no special expenditure. Other restorations in a similar spirit will probably be made as opportunity offers.

GENERAL.

M. Garnier delivered an address on Sunday at the unveiling of the statue of Berlioz, the composer, by M. Lenoir, in the Place Vintimille, Paris.

Mr. Frank Holl is painting a portrait of Sir George Trevelyan, to be presented to him by the electors of Hawick.

The Duke of Sutherland has offered to the School of Art at Stoke-on-Trent a cast taken from the statue of *Jonah*, attributed to Raphael.

A Statue of Rude, the sculptor, was inaugurated at Dijon on Sunday.

Mr. Allan Fraser, H.R.S.A., last week received the freedom of the burgh of Arbroath in presence of Mr. W. Calder Marshall, R.A., Mr. John Hutchison, R.S.A., and other friends

The Exhibition of the "Incohérents" in Paris was on Sunday visited by several thousands of people. It will remain open for about two months, and the proceeds are to be given to charities.

Mr. W. M'Ewan, M.P., has offered to give 50,000*l.* for the erection of a grand hall and other additions to the new University buildings in Edinburgh.

The Eastbourne Town Hall was opened on Wednesday. The building was designed by Mr. W. T. Foulkes, of Birmingham.

The Grand Casino of Biarritz was destroyed by fire on Sunday morning, but the adjoining Hôtel d'Angleterre was preserved. The damage is estimated at 700,000 frs.

The Water Supply Works just completed at Stratford-on-Avon will be inaugurated on Wednesday next.

The Holborn Union Workhouse, erected at Mitcham, from the designs of Mr. H. Saxon Snell, F.R.I.B.A., was formally opened yesterday.

"**L'Art**" contains an engraving of the statue of Berlioz that was unveiled on Monday in Paris, with articles on the composer, French woodwork, and other subjects, besides several engravings.

The Théâtre-Montparnasse has been reconstructed under the direction of MM. Peigniet and Marnez, architects, at a cost of 250,000 frs. It will contain 1,200 places. An iron curtain is provided at a cost of 8,000 frs. The house will be opened on the 28th inst.

Truro Cathedral, it is expected, may be ready for opening during the month of August next, and the Queen and Prince of Wales will probably be asked to be present on the occasion.

Mr. E. H. Banks has offered to the Carlisle Corporation the bell formerly in Silloth church, for the town hall clock. The bell, however, is said to be too heavy for the tower.

The "Journalist," a paper for all newspaper producers, appeared for the first time on Friday last.

Ladhope Old Free Church, Galashiels, was sold on Monday by auction. The upset price was 500*l.*, and it was sold to Mr. A. Herbertson at 505*l.*, on behalf of Messrs. Gibson & Lumgair, manufacturers.

The Architect.

THE WEEK.

A month ago, when referring to the proposed Colonial and Indian Institute, we were enabled to indicate the line of action that was adopted in the highest quarters on the subject, as well as the proposals of the leading commercial men in the City, and to suggest that the two were in opposition. In a case of the kind some obscurity could not be avoided, but our readers were no doubt able to read between the lines of the "Note." A communicated article in the *Times* of Tuesday confirms what we said. In the first place, Her Majesty has expressed a desire that the Jubilee Memorial is to be at South Kensington. In the next place, a good deal of pains is taken to limit the restriction to utility imposed by the site. It is said that an attempt is to be made to reconstruct the Albert Hall Company, and as the present gardens are to be utilised as part of the scheme, there is no fear that the Imperial Institute will have them attached. It is also admitted that "it would be a disgrace to the Empire in the eyes of other nations and of future generations, if the great memorial marking one of the most momentous periods in the history of the Empire were to consist solely of a few acres of sheds little better than those which now cover the ground at South Kensington." All this tallies with what we wrote, and reveals the change in the minds of the promoters during a month. We said that the further the Institute was from South Kensington the better, and the writer in the *Times* reveals that "merchants and manufacturers and colonial producers have emphatically urged their objections to South Kensington as a site for a commercial museum that would be of any practical utility." It will be thus seen that while authority favours South Kensington, business seeks another site. Would it not be possible to get over the difficulty by having two museums? It is understood that an effort will be made to retain the contents of the present exhibition for the Institute. Many things among them would be considered rubbish in the eyes of merchants and manufacturers, but they are no less interesting to sight-seers. Let a building be erected at South Kensington to preserve objects of the kind, with others like them that might arrive from time to time. It should be a new building, and not the City and Guilds Institute transformed. But let a second building be raised in or near the City, and let it be arranged in such a way that there can be no suspicion of the contents being playthings to amuse idle people. Two conditions are requisite to attain that end—a business institute cannot be at South Kensington, or controlled by South Kensington officials.

The Salle des Etats, in the Louvre, between the Pavillon Denon and the Grand Galerie, and which separates the Cour Caulancourt from the Cour Visconti, has been appropriated to modern paintings of the French school. Four of the principal works of Delacroix, viz., the *Entry of the Crusaders*, the *Moorish Interior*, the *Bark of Don Juan*, and *Dante in the Inferno*, with the well-known portrait of the painter, have been placed there. The *Apotheosis of Homer*, by Ingres, which was illustrated in *The Architect*, is on the opposite wall, with a *Combat of Stags* by Courbet, and the *General Prim* of Henri Regnault. The rearrangement has, up to the present, given general satisfaction.

The art annual published by Messrs. J. S. Virtue & Co. has Mr. Alma Tadema for subject, and forms a fitting companion to the two by which it was preceded; indeed, it has more illustrations than either of them. Owing to the character of the painter's work, it has also more unity, and the annual seems at first sight to be a treatise on Roman life. In that respect it puts some learned treatises into the shade, and it becomes a delightful archæological manual. From the memoir we learn that the Tademas have dwelt in the Frisian village of Drouryp from time immemorial, but the prefix Alma is peculiar to the painter, as he received it from his godfather. It is interesting to learn that, although Mr. Alma Tadema showed artistic ability from his earliest youth, yet his relatives insisted on making a lawyer of him. It was only after a severe attack of illness that he was allowed, as a favour, to study art. Then he could not gain admission to an art school in Holland, and was compelled to pass on to Antwerp, which is entitled to take pride in his success. There he displayed the fastidiousness which is one of his characteristics. From the Academy Mr. Alma Tadema went to the studio of Baron Leys, the painter to whom he is most indebted. At first he painted Mediæval subjects, but in 1863 he began to represent scenes of an earlier time, starting with Ancient Egypt. In 1869 he arrived in England. His *Vintage*, which is one of his most popular works, was produced in 1870. His power was early recognised, for six years afterwards he was elected an Associate of the Royal Academy. Some of Mr. Alma Tadema's thoughts on art are appended. He is severe on modern critics, and with reason, for the majority only judge by the subject. What subject, he asks, is there in the *Venus of Milo* that can be written down, yet nobody will deny that it is one of the greatest works of art? He is opposed to much travel, and says, quite truly, that the Prix de Rome men of France and Belgium, with one or two exceptions, do not become famous. The reader will find the annual worth many times the small sum that is asked for it.

There is a vast difference between the results of the Liverpool and the Edinburgh Exhibitions. Liverpool has not been a financial success, and looking at the way the medals were sent about no one can be surprised, for that event reveals other misdeeds. In Edinburgh there is so large a surplus that the Committee hardly know how to get rid of it. They have done one graceful act. On Tuesday, the Committee offered the grand hall, the sun-dials, the manager's house, the model dwellings, the college gate, all being of the value of 16,000*l.*, to the Corporation, together with 2,500*l.* for structural repairs, and a sum that will produce 200*l.* a year to pay for future repairs. But it will scarcely be credited that there are statutory difficulties in the way of accepting so generous a gift. Such is law!

A year rarely passes of late without a new Raphael appearing. This time the favoured place is Lausanne. The new masterpiece was familiar for a long time to the old furniture-dealers in the purlieus of the place. It was what London auctioneers call "a speculative lot," but the value of it among the trade never got beyond 3*l.* sterling. However a M. Nicole came, saw and conquered the work on easy terms, say about 8*l.* He obtained a new name for the picture as well as a new frame; it became the *Vierge au sein.* It had a triumphal procession from gallery to gallery, and of course the critics grew eloquent over its qualities. The price increased by travel, and, according to the last quotation, it stands at 8,000*l.* It was supposed that a lady was about to gain fame by investing in the work, but at the last moment her courage failed, or she grew alarmed at the prospect of seeing her name in all the newspapers. The latest news is that M. Nicole proposes to carry his treasure to Paris, and set it up in the Salon Carré of the Louvre, in order that it may outshine the Raphaels to be found there. As another Nicole says in the "Bourgeois Gentilhomme," "Ils se trouvent bien ensemble!"

The picturesque and the sanitative are not synonymous. There is no city in Europe that has the making of so many pictures in it as Edinburgh. But since the sanitary inspector began his rounds there are unpleasant revelations of what is to be found behind the walls with such a charming play of light and shade, and so many "bits" of detail. In a report of the Burgh engineer, which was issued on Monday, we are informed that "during the past year 1,001 dwellings have been, or are being, supplied with water and water-closet accommodation." Imagination had better not dwell on the condition of a city which is improved at that rate, nor inquire when the last of the unclean dwellings will be reached. But it is worth knowing that twelve years ago 14,000, or one-third of the houses in Edinburgh, were without closets, and over 8,000 had no water supplied to them. It is not surprising that so many of the inhabitants look as pale and unhealthy as the people in the east of London.

FEDERATION.

FROM want of space last week we were compelled to forego the publication of some letters relating to the latest phase of the federation question. The writers were so little agreed that it was impossible to make a selection, and we must have printed all the letters or none. We had to adopt the latter course, but the subject of the correspondence is too important to be passed over without a little consideration.

When the proposal for federation was first mooted we expressed an opinion against it, and we still maintain that any arrangement of the kind can only be nominal, and is therefore of no great importance to architects. We must, of course, except those who like to play at organising their brethren. For what is the meaning of federation if it is not a contract, or obligation, by which individuals or societies agree to give mutual support? Can anyone who knows the state of architectural practice in this country believe that such a league is possible, unless in respect of questions in which there can be no clashing of individual interests? Every architectural society is to some extent an example of federation, but the history of them shows that a member's cause is rarely made the cause of a society. In this way even Lord Grimthorpe would agree that they differ from trades unions. It would be vain to suppose that by any combination on paper of the different societies the interest of an individual member would assume more importance than it does at present.

What has just occurred will by itself suggest whether the time has come for union. The Institute, as we all know, appointed a committee to consider the subject of federation. Time does not count for much in Conduit Street, but a report was not unlikely to be issued within a year or two, and there was no great urgency on the subject. Another committee was, however, formed elsewhere, of which some Fellows and Associates of the Institute were members, and went to work in a very different way. A form was issued which suggested that federation was an impossibility without compulsory registration. To accomplish that end, an Act of Parliament was of course essential, making it penal for any one to practise architecture after a certain date without undergoing an examination, a saving clause being introduced for the benefit of all who claimed to be architects, whether competent or not, who might be in practice at the time. As a rule reformers try their hand with the present time; but the anxiety of the Federation Committee began with the clients and architects of the future. Two months ago, when the document appeared, we wrote against it; but we are now informed that over a thousand architects declared their approval of the proposals.

So much support must have amazed the Federation Committee, and on the strength of it the conclusion was come to that the best way to demonstrate the federal spirit would be by forthwith opposing the application for the Institute charter before the Privy Council. It is henceforth to be understood that with federation a society is not to be considered the best judge of its own affairs. The aid of the Society of Architects was invoked against the Institute, for another effect of the new species of federation is that society is to be set against society, in order to promote the general good. The Society of Architects hesitated until it had acquired an opportunity of conferring with the Council of the Institute on any day after the 22nd inst. In other words, the Council might save the Institute from defeat by withdrawing the application for a charter, and throwing in its lot with the victorious Federation Committee.

That the proposal for a conference should excite the ire of the authorities of the Institute is not surprising, for the establishment of the Society compelled the Institute to make a show of awakening from the lethargy which used to be taken as a sign of respectability. The members have not derived any great gain from the exertion, but the officials feel that times have changed. They can no longer enjoy the repose that follows from what the Frenchman calls "les doux plaisirs d'une paix fraternelle," and of course are not likely to forgive the cause of so much inconvenience. An incoherent sort of circular was at once issued, which reveals the state of feeling in the bureau of the Institute. But, like all bodies that are subject to scares, the Institute is squeezable, and the hectoring tone of the circular was soon followed by a conciliatory announcement that the Institute Committee on Federation is to meet on the day after the delivery of the presidential address. For it is to be remembered that next week the case of the charter has to be heard, and opposition of any kind is dangerous.

If the Federation Committee or any body of architects will appear before the Committee of the Lords of the Council on Wednesday and explain the real character of the proposed charter, we are disposed to believe that there is a chance of its rejection, for to approve of a deed which is declared to be remarkable for its elasticity is to set up a precedent that might be inconvenient in more important cases. But that course is not to be recommended. The members of the Institute accepted the clauses, and it is hardly the business of another body to save them from the consequences.

The Federation Committee raise opposition on the ground that the charter will be an obstacle to the carrying out of the Act for Compulsory Examination and Registration, should one be obtained. But is an Act of that kind ever likely to be among the statutes? It is quite true that Bills somehow get passed occasionally without much examination, but they belong to some of the great interests that are represented in Parliament, and the Federation Committee is not likely to have a body of members under its thumb like one of the big gas or water companies.

To pass an Act of the kind it would be necessary to make out a stronger case than can be done. There is no use in concealing the fact that the necessity of architects is not more manifest to anyone who considers them from the legislator's standpoint than is the necessity of painters, sculptors, and writers. Every member knows that substantial buildings can be erected without the aid of architects, and he is likely to believe that on principle they are not employed on Government buildings. If he has had no dealings with one he is sure to know of the allegations against the profession, and will be sceptical about the motives of reformers. Nowhere is there a stronger prejudice about the misdeeds of architects than in the Houses of Parliament, for almost every member finds a cause of complaint in the arrangements. Does anyone suppose that a noble lord could be discovered with sufficient courage to reply to Lord Grimthorpe, supposing his lordship had moved the rejection of the contemplated Bill?

On such an occasion the question would be asked, Where was the gain to the public from a Federation Examination Act? If we assume with the Institute and the Federation Committee that there are incompetent architects who are not duly elected members of the societies, still the shortcomings in their designs are set right by the builders. Until it can be shown that houses by one class of architects are liable to collapse and bring danger to taxpayers there will be no case for compulsory examination. Now, in spite of the sudden gales which arise in England, houses do not tumble. It takes a big storm to affect one of the jerry-built houses made up of bricks separated by road sweepings.

It will be said that the application for an Act of the kind could be based on the importance which the architect has assumed under the prevailing theory of sanitation. As a factor in preventive medicine he is supposed to come near the doctor, and therefore should be legalised like him. But the doctor does not act by deputy, or only by a deputy that is also legalised, while the deputies of the architect are endless. Every man on a building, from the excavator who opens a trench to the financier who receives cheques on a certificate, are in their way deputies of the architect, and if an Act existed of the kind which is suggested he would become responsible for their misdeeds to an extent that is now unknown. It is not easy to obtain Acts of Parliament to confer privileges without something being done in return, and the Federation Committee would do well to ask themselves in what way they propose to increase an architect's liability, for that will be necessary if he is to be distinguished from painters and sculptors by having the protection of an Act of Parliament.

But assuming that the Act was obtained, and a system of examination and registration in force, would there be much of a benefit to the rank and file of the profession? The examination would have to be limited, and is not likely to be more severe than that for candidates for district

surveyorships. It is not necessary to be a Wren or a Barry to undergo one of that class in safety, and a bungler might contrive to pass through it. Besides, if examinations were general the architectural crammer would be created, and if, as commonly happens, the candidates had the faculty of forgetting soon after an examination, we do not see how affairs would be improved. The profession might be narrowed to an infinitesimal extent, and that is all.

Acts of Parliament are inconvenient treasures for any set of men who are liable to change. Architecture has changed before now, and may do so again. The relation between the architect and the builder at one time was indistinguishable. With the introduction of technical education, building might once more rise into favour, and architects become imitators of prominent members of the Institution of Civil Engineers, who find a pride in undertaking a difficult contract. On the other hand, the realisation of William Burges's dream might come to pass, when the architect is to prepare designs in a luxurious office and leave the carrying out to an inferior race of surveyors. An Act of Parliament would not be of much avail in the latter case, for we can hardly suppose that a Bill could pass through the two Houses for the enforcement of truth and beauty unless under a new constitution derived from Utopia.

An application for an Act like that proposed by the Federation Committee presupposes a nearer approach to unanimity among societies than is possible—that is, if we may judge from the conduct of the Institute and the Society of Architects to one another. All big societies are jealous and hanker for a monopoly of power. What is needed is not an organisation to unite architects in a great society, but one that will break up the societies into many with no more than a reasonable number of members. The benefit that an architect can draw from association in any case is limited. If he has a wish to be successful he must learn to stand alone, to seek his commissions himself and not through a brother architect, to design, when he gets the chance, with his own right hand without having recourse to his neighbour, to settle his differences with contractors and clients with such equity as he possesses. If he seeks aid he is more likely to find it in a society where men can meet without formality, where there is free criticism and where there is no necessity to address reporters. A man may fancy that he derives reputation from being able to show that he forced his way to the front in a crowd where there are notabilities. But the world does not always take that view. Let any one, for example, recall the history of the Institute, and they will find that the members who were most distinguished as essayists and speakers were rarely successful as architects. How many buildings were designed by Donaldson, who carried everything before him for years?

Societies do not, as we have said, make a common cause of the grievance of a member. Probably they dare not do so. There could not be a much stronger proof of this than the case of the Barony Church competition. Mr. Honeyman has held a high office in the Royal Institute and in the Glasgow Institute. He knows the futility of both whenever a member desires to excite the reprobation of a wrong, and accordingly he turns to the professional press. Mr. Honeyman's case also suggests that an architect must not be expected to sacrifice himself to an imaginary *esprit de corps*. His competitors were all fellow-members of the local society; some were, like him, members of two societies. But, according to Mr. Honeyman, there was only another competitor and himself who adhered to the instructions. Everyone knows that it would be vain for him to expect that either of his societies would utter a word of censure of the practice of deviating from the track in order to gain the prize. Would Mr. Honeyman be more likely to be supported if half a dozen societies were federated with those to which he belongs? If a society with a large roll of members like the Royal Institute and an important provincial society like the Glasgow Institute cannot make the members loyal to one another, we are afraid that a union of the two with the Architectural Society of Little Peddlington would not be more effectual.

Another case, no less exemplifying the relation between architects is that of the Elland Town Hall. The ordinary rule of fees was set aside, and not more than four per cent. will be paid for designs, quantities, and superintendence. It is left to a competitor to say how much less he will take. Yet so attractive was the proposal that there was a scramble for the conditions. It is quite possible that offers as low as two per cent. will be made: indeed, we have heard of a case where an equal amount of work was done for one and a half per cent. Is it to be supposed that all the aspirants for the honour of designing the Elland Town Hall are architects who do not belong to any of the societies?

As long as competition is one of the distinguishing marks of the architectural profession, there cannot be a local or general federation that will be more than a sham. Something of the kind may be found in other professions, but neither doctors nor lawyers have to stand the strain of offers of commissions by means of competitions. If they were in the same position as architects, they would probably think as little about what is called the general interest of the profession. No Act could be passed in Westminster to prohibit people like the Elland authorities from making the best bargain they can with architects, or to prohibit architects from dealing with them; and as long as legislation is in that state it is only adding to the delusions which architectural societies have created when they propose to form a federation league in England, and to obtain privileges for it from Parliament.

THE ASSOCIATION MASONRY CLASS.

On Tuesday the Class of Masonry which was organised by Mr. L. Harvey, as honorary director, for members of the Architectural Association, was opened in the City and Guilds of London Institute, South Kensington. The President of the Royal Institute of British Architects and some of the Fellows attended. The following address was delivered by Mr. Harvey on the occasion:—

Gentlemen,—In the Polytechnikum of Zurich and the Ecole des Beaux-Arts of Paris, establishments of which I have been a pupil, and in every other school of architecture on the Continent, the knowledge of masonry and of its theory under the name of "descriptive geometry" is considered the indispensable basis of an architect's education. Up to this time English architectural students have had no opportunity of studying either the theory or the practice of masonry. It is certainly not one of the subjects taught in an architect's office, and, on the other hand, it is an art which remains nearly an impenetrable mystery to those who try to get at it through books. It is for this reason that I have offered to hold classes of masonry in this establishment, at hours convenient to the members of the architectural profession.

Amongst architects—even students—it would be superfluous to attempt to give a definition of the art of masonry, for we all know very well what it is. But I may say that it comprises two questions:—1. Which are the shape and the dimensions a stone structure should have to insure its stability, and to satisfy the requirements of taste and convenience? 2. The shape and dimensions of a structure having been determined beforehand, how to produce the structure out of an aggregate number of blocks of stone of moderate size and of such shape that, placed side by side in a given order, they will support one another as if the whole structure consisted of one single stone?

The first question depends on the laws of Statics, on the toughness of the stone used, on the artistic rules of architecture. This is, therefore, a vast subject of study, which includes nearly all the science of construction and the history of architecture. I do not intend to treat this part of our subject, but will confine myself to the second question only, viz., to showing you the scientific operations of stone-cutting, or the methods by which the mason obtains from the designs of the architect the exact shape of each stone in a building, so that, when set in its place, it shall fit exactly the adjacent stones without previous reference to them.

Even in this limited sense the study of masonry is not merely a matter of technical interest to the stonemason, but is of importance to the architect. 1. There is a close union between the geometrical rules used by masons at different periods, and the architecture of the time when they practised. Thus, the Greeks, who understood conic sections, applied them in their mouldings, whereas the Romans, who did not, were content with circular curves only. The groins of the vaulted halls of the Romans form waving lines which were dissimulated behind a stucco decoration of carpet pattern, a clear proof of their ignorance of the scientific operations of masonry relative to vaults. Later architects tried to overcome the same difficulty by building the groins as separate ribs, a system of masonry which gave rise to Gothic architecture. It is evident, therefore, that a knowledge of masonry will help an architect to properly appreciate the characteristics of past styles of architecture.

2. The geometrical operations used in masonry are equally applicable to carpentry and joinery, to erecting centreings for brick and concrete vaults, to forming circular and other stairs in wood, as well as in stone.

3. They are a great assistance to the architectural draughtsman; they give him the means of delineating intersections of surfaces and of shading his drawing with mathematical accuracy.

Now, gentlemen, I know very well that in offering to teach you masonry without introducing it by a course of descriptive geometry, I am exposing myself to the accusation of putting the cart before the horse. Masonry is only one of the applications of descriptive geometry, and, therefore, *logically* the study of descriptive geometry should precede that of masonry. This I admit, but, gentlemen, the logical sequence is not always the most natural. The Latin language is undoubtedly the application of the rules of the Latin grammar, and in our schools it is usual to begin by conjugations and declensions before the pupils are set to composing Latin sentences. This is the logical sequence. Nevertheless, the Roman spoke Latin from his babyhood, and, if he ever learnt grammar at all, it was long after having practically mastered his native tongue. This is nature. Similarly masons have practised the geometrical operations of masonry for centuries before descriptive geometry was invented. Why should we not do likewise?

The stonemasons of France are still embrigaded in one of two guilds dating from the Middle Ages. The one is called "La Confrérie des Compagnons de la Loi," or "Les Loups," and the other that of "La Confrérie des Compagnons du Devoir," or "Les Dévorants." In nearly every town of France these guilds possess hostelries called "Mère des tailleurs de pierre," where the "compagnons" have a right to put up on credit until they obtain work. To become a "compagnon" an apprenticeship of seven years is required and a stringent examination in the science of masonry has to be passed before the masters of the craft *les appareilleurs*, for it is important that none but able workmen should be admitted to the privileges of "companionship."

While I was studying at the Ecole des Beaux-Arts, I got introduced to one of these guilds of stonemasons, so as to pick up practical knowledge as well as theory. It is there that I have seen in working the system of instruction which has been preserved traditionally in these guilds from the remotest times of the Middle Ages, in fact the very system by which were formed the architects of Westminster Abbey and other glorious fanes. It is, gentlemen, thanks to that ancient system of tuition that I hope you will find the science of masonry both easy and entertaining.

I beg to point out one of the great advantages obtained by beginning our studies at once by masonry. Speaking from my own experience, descriptive geometry, when studied as a pure mathematical science, is apt to weary one, for it seems an aimless series of abstractions. I have often heard students ask, "*What is it all for?*" If you have already studied masonry, you see at once *what it is all for*, and descriptive geometry becomes intensely interesting, as furnishing the key to all kinds of questions which have arisen in your mind.

For instance, in descriptive geometry a plane is said to be generated by the motion of a straight line in contact with two other straight lines which either meet or are parallel. When the last neither meet nor are parallel, the surface generated is on the wind. This seems rather a pedantic definition of a very simple thing, but to the mason this definition has a practical meaning, for it expresses the very operations he does when working a plane face on a stone. As to winding surfaces, he is but too well acquainted with them, for if he be not very careful in drawing his guiding lines he will find that the surface produced is on the wind and not the plane. In the same way the scientific definitions of a cylinder simply express the operations by which masons work cylindrical surfaces.

The material we will use in lieu of stone for building our models of masonry is a composition of fine plaster and soap. This material costs but a trifle, and remains soft for any length of time instead of becoming brittle, like pure plaster.

I shall in every case explain the exact way the stonemasons use in cutting the stones so as to save their labour, but I do not think it would be worth our while to imitate on a small scale the exact handling of a mason's tools. What interests us are evidently the geometric operations of stone-cutting, and the more rapidly we shall be able to cut out the stones of our models the better. I propose, therefore, that we should use saws as much as possible, of which there are two sorts, one for cutting out planes, the other for cutting out cylindrical surfaces. A small chisel is required for cutting out such surfaces as cannot be worked with a saw.

It was my intention, gentlemen, to work out fully each problem of masonry on the black-board, so that you might see the successive operations carried out in your presence. But I find that the arrangements of our black-board will not allow of my doing so. In the absence of the particular black-board required, I must be content with explaining the operations of masonry on working drawings made beforehand. As the first class which I shall direct is limited to but a few, I think we will find this arrangement feasible.

Then from my drawing and the moulds I shall make for you, you will each cut one stone of the model to be constructed. In fact, we will form a diminutive mason's yard, in which I shall act as foreman, and you as stonecutters.

When you have completed cutting the stones, you will then make the same working drawing as the one I shall have prepared for you. I believe you will find this operation much easier after having built up the model of the structure than you would have found it before you had realised *de visu* what you were going to draw.

You will then be ready to act as foremen in the subsidiary classes. For this purpose you will use the drawings you have made under my direction; and as each of you will probably have but a few pupils to instruct, you will no doubt be able to explain all the operations of stone-cutting without the help of the black-board. At all events, although the instruction of the subsidiary classes will be entrusted to the members of the first class, still I shall make a point of attending also myself to give assistance when wanted. In their turn the members of the subsidiary classes should complete their instruction by acting as teachers to others. They may have an opportunity hereafter of superintending the instruction of future classes of masonry in this establishment; but, at all events, they can at once offer their services to the existing institutions for the technical instruction of workmen. They will thereby attain three desirable objects: they will get useful practice for themselves; they will promote the interests of architecture by forming abler workmen, for much of the beauty of our art depends on the perfection of its execution; lastly, as the superior officers of the great army of the building craft, they will get a more intimate acquaintance of their subordinates, and be able to inspire them with the same lofty aspiration and pride in their work as all true architects possess.

I think I have now fully explained our plan of campaign. It only remains to me to thank our visitors for the interest they have taken in this matter, and to begin work at once with the members of the first class.

Mr. Cates said he was very pleased to see such a class started, for it was very much required. He had seen the Paris Municipal classes of masonry, and he had been surprised at the results attained. The pupils were workmen who, after a hard day's labour, turned out drawings which certainly very few architects could equal, and worked out problems of masonry far more difficult than anything Mr. Harvey contemplated for his class. He only wished he had had in his youth such an opportunity as the one Mr. Harvey offered them, and he hoped that the architectural students would attend in great numbers, and that these classes of masonry would develop themselves more and more with time as they deserved.

Mr. Robins said that, as a member of the Executive Council of the City and Guilds of London Institute, he was glad to see so many architects assembled in this building. The classes of masonry were a small beginning, and might eventually develop themselves in a large school architecture. In Mr. Harvey, who had studied in Germany as well as in France, they had an exceptionally able instructor.

The proceedings closed with a vote of thanks to Mr. Harvey.

THE SCOTTISH WATER-COLOUR SOCIETY.

THE annual exhibition of the Scottish Society of Painters in Water-Colours was opened on Thursday in last week. There are 689 works shown, which is less by 175 than the number seen last year; but the general character of the exhibition is maintained. Among the English artists who are represented are Sir John Gilbert, Sir J. D. Linton, Mr. H. S. Marks, Mr. J. W. North, and Mr. E. S. Calvert. Sir W. Fettes Douglas, the President of the Royal Scottish Academy, has three small sketches. The influence of the French school is seen in the works of the younger exhibitors.

A luncheon was given by the Council on the opening day, at which Mr. F. Powell, the president, was chairman.

The Chairman, in proposing the first toast, said that no one could shut his eyes to the facilities for the art student in France, or the rapid strides in the power of drawing he gained there. But though there were French painters of the noblest stamp, yet when one thought of the pictures that crowded the walls of the yearly Salon, and remembered the subjects of ghastliness and doubtful morality, one dreaded the influence such teachings must have on the susceptibilities of youth. Good art required both skill and purity for its perfect development, hence he desired that our own Royal Academies should supplant all foreign teaching.

Sir Wm. Fettes Douglas said he was happy to hear the President say he did not think art students needed to go to France. He saw no reason whatever for their going to France,

and they in the Academy in Scotland had been endeavouring, and were still endeavouring, and would continue to endeavour, to make every provision for the education of youth amongst them. In Glasgow, it was true, they might not have as many advantages as were to be had in Edinburgh, although he could not say exactly, as he had little knowledge of art in Glasgow. There was one thing he was very much struck with, and that was that there was a very strong rising school of artists in Glasgow. He trusted they would make themselves more felt in Edinburgh than they had yet been able to do in the past. The Royal Academy was not for Edinburgh alone. It was the Royal Scottish Academy for the whole country. He trusted the members of the Glasgow school would make themselves felt in Edinburgh, and be looked up to by the Academy, and exercise their own influence upon the whole art of the country. He did not know why they had not been so well known in Edinburgh as they ought to have been. He himself had been very much exercised in Edinburgh regarding that matter. He was extremely struck—very much struck—with the amount of ability shown all around the walls. He advised young men not to rest from their labours, for the longer a man worked the better would his work become. Many a young man ceased to do good work from the day he succeeded in getting his pictures on the walls.

Mr. Colin Hunter, A.R.A., also replied.

Mr. Wm. M'Taggart gave the next toast, "The Glasgow Institute of the Fine Arts." No one would deny that the Glasgow Institute of the Fine Arts had done a great deal to forward the interest of art in Scotland, especially in the West of Scotland, although he maintained it had also helped art all over the country. Like the Royal Scottish Academy, it had been a centre, although, unlike the Academy in one respect, it had no school for the training of artists. In these times it was necessary that something should be said about the schools of art in this country. There were many of them, but the two most famous were those of the Royal Academy in London and the Royal Academy of Scotland. He did not think it was generally known that the best men in those societies were told off to give instruction gratis to the pupils. He could not recall any other profession that did the same thing for its pupils. In both medicine and the Church the best men were told off to instruct students, but they were paid very highly for it. The institution he had the honour to propose was doing its best without schools to impart training by its exhibitions and in other ways. The feeling now was that there were too many exhibitions, and there was a great deal of truth in that. Many of the works sent to exhibitions were done by young girls not following art as a profession, but only amateurs. This was a matter for the council, who could, by choice and selection, do a great deal to purify and clear the annual exhibitions. A hint which was given them by the French might be imitated with advantage, and that was to hold triennially an exhibition of selected works. He thought such an exhibition would do a great deal of good, not only in exhibiting works which had been exhibited before but in showing what an exhibition of carefully-selected works might be. Mr. M'Taggart went on to speak of some of the things with which they had to contend, and he alluded particularly to centralisation. Whenever an artist became famous the temptation to go to London was very great.

Mr. E. D. Outram said it augured well for the prospects of art in Glasgow that all the societies were working so cordially together, having only for their object the exaltation of art. He thought there was a feeling among them to draw closer to each other, and perhaps they would soon be accommodated under one roof, having separate departments. Art had suffered from the depression of trade, but they all hoped the worst was past, and that we would soon have the good times back again.

Mr. Renny Watson gave the next toast, "The Scottish Society of Painters in Water-Colours."

The Chairman, in replying, said there were not so many pictures on their walls this year as last, but the progress shown was so great that it fully compensated for any diminution in number—in fact, the advance made by some of their members was extraordinary, illustrating, he thought, forcibly the benefits the society was conferring in giving an impetus to water-colour art. Lately there had been several letters in the *Times* newspaper under the heading, "Light on Water-Colours." These had provoked considerable discussion, and had probably influenced many admirers of drawings in a most prejudicial manner, and a word or two on the subject, without going deeply into it, might not be out of place, and clear away a few wrong impressions. No doubt some old water-colour pictures, like old oils, had suffered from age, but others were as beautiful as on the day they were painted. There were pigments in both mediums which were fugacious, some in one way, some in another; but, fortunately, there was an ample number of permanent ones. The water-colourist had an advantage over his brother oil-painter, inasmuch that the improvements in the aquarellist's art were greater than in oils, and the water-colours of to-day would be infinitely more durable than those of the times of Girton, Barret, De Wint, Varley, Turner, &c. In oils he knew not any advance that gave a clearer daylight or richer shade than already achieved by the old masters. Nay, it even seemed as if their secrets of permanency had been lost, many oil pictures of modern date suffering diminution of brightness to a serious extent. Years ago he experimented on numerous pigments, which resulted in his discarding several from his box, and this April he again tried those he habitually used to the action of the sun. He painted shaded bands of different colours on long strips of paper, and cut them in two lengthways, placing one set of halves in a window facing the south, and the other in a drawer in his studio. After six months' exposure to the daily sun there was no perceptible difference between the colours on the slips exposed and on those kept in the dark. Professor Hartley said that direct sunlight was probably four hundred times stronger than the suffused daylight in a room. From that he thought they might conclude that a water-colour picture painted with good pigments and properly cared for would last for centuries with all its charms, delighting many generations of men.

EDINBURGH MUNICIPAL BUILDINGS COMPETITION.

THE following circular was issued a few days ago to the architects engaged in preparing plans for the Edinburgh new municipal buildings:—

"City Chambers, Edinburgh: October 18, 1886.

"*Edinburgh Municipal Buildings Competition.*

"Dear Sir,—The Committee of Town Council charged with this matter, having found it expedient to relinquish their intention of acquiring any property to the west of Warriston Close, I beg to enclose a supplementary plan showing the requisite modification, and hope you may be able to adapt your design thereto without much trouble.—Yours faithfully,

"Town Clerk."

As it is now some time since the original plan was issued, most of the competitors are already well advanced with their work, and great dissatisfaction has been created, as the result will probably be that designs will have to be recommenced. According to the *Scotsman*, several letters have been sent to the town clerk complaining of this departure from the original plan, and pointing out the great inconvenience and waste of time which, in their case, it involves. In some instances grave doubts were expressed as to the possibility of finishing the work in the stipulated time. A meeting of the committee charged with the matter was held on Monday in the Council Chambers to consider the matter. During the discussion it transpired that the limitation of the site was due to the decision of the committee not to acquire the property of Messrs. M'Laren, Son & Co., unless at a considerably smaller sum than 50,000*l.*, which is said to be the amount asked by the firm. The result of two hours' deliberation was that the limitation embodied in the circular should be adhered to, but that competitors should be allowed another month to alter their plans.

ROYAL HIBERNIAN ACADEMY OF ARTS.

AT the annual meeting of the Academy the following elections were made for the year 1886–87:—

President, Sir Thomas A. Jones; secretary, B. Colles Watkins; treasurer, Thomas Farrell; keeper and librarian, P. V. Duffy; visitors—living model school, P. Vincent Duffy, Thomas Farrell, Alfred Grey, W. Osborne; visitor—day living model school, S. Catterson Smith; professor of painting, Sir Thomas A. Jones; professor of sculpture, J. R. Kirk; professor of architecture, Thomas Drew; professor of anatomy, W. Thornley Stoker, M.D.; professor of history, W. J. Fitz-Patrick, J.P.; professor of literature, Edward Dowden, LL.D.; professor of antiquities, J. T. Gilbert, LL.D.; professor of chemistry, Sir C. A. Cameron, M.D.; trustees—Sir Thomas A. Jones, B. Colles Watkins, W. Osborne; auditors, A. J. Mayne, Thomas Drew.

Council 1886–87—senior members—G. C. Ashlin, P. V. Duffy, B. Colles Watkins. Junior members—T. N. Deane, W. Osborne, S. C. Smith.

At the annual meeting, held on Monday, the 18th inst., Mr. Walter F. Osborne was elected a constituent member of the Academy, which election has since received the approval of His Excellency the Lord Lieutenant.

At the annual competition in the Academy schools for the year 1885–86, the following students were awarded prizes:—The Albert Scholarship, 20*l.*, S. C. Cairns; special competition, drawing from the living model, silver medal, J. P. Moran; ditto, bronze medal, Oliver Sheppard; drawing from the antique, bronze medal, J. C. Radcliffe; prize of 4*l.*, best drawing from life, J. O'Reilly; ditto 2*l.*, second ditto, J. P. Moran; ditto 2*l.*, best from antique, J. O'Reilly; ditto, 1*l.*, second ditto, J. C. Radcliffe; ditto 3*l.*, best study in painting, A. Casciani; ditto 2*l.*, second ditto, C. E. Lodge.

NOTES AND COMMENTS.

Anyone who at the present time enables this country to compete with foreigners is rendering a public service. One of the trades which Germans, Italians, and Frenchmen have contrived to monopolise is the gilding of plates of glass. The demand for work of that kind is increasing every year. Nor is this surprising, for gilded glass can be used for an almost infinite number of purposes. It can be applied to utilitarian needs, such as announcements of various kinds as well as to decoration. But the processes in use have been slow and expensive. A new process has been discovered by a Mr. Pratt, who was at one time an engineer working under George Stephenson, and he has disposed of his rights to a company. When it is known that Mr. George Matthey, F.R.S., is the chairman of the company, there can be no doubt either of the efficiency of the process or the prospects of the shareholders. The principal feature in the new process is the precipitation of the metal. One of the advantages that follow is the saving of time. We saw specimens produced in as many minutes as they must have taken days if an amalgam had to be applied. Then again a broken surface for the gilding is obtainable if necessary, and that is not practicable by hand labour without a vast amount of trouble. A third advantage of the process is that when an elaborate subject is painted on the glass the gilded background can be applied without the least injury to the painting. The gilding is preserved by a coating, and becomes indestructible. In a word, the new process has all the good qualities of the one in use with many that are unattainable by hand gilding. The company can secure a wide field to work in, and, as the process admits of hand painting in connection with it and superior artistic skill, the operations of the directors will be watched with interest. This mode of gilding can easily be made subservient to the decoration of buildings and furniture. Indeed, it can be said that it is not often a scientific process is to be found that so readily becomes an efficient auxiliary to art. For the present the specimens are to be seen at 82 Hatton Garden.

Whenever we suggest that the Ecole des Beaux-Arts in Paris is a moribund institution, some readers may suppose that we are inspired by prejudice against a famous school. The *envois* or works sent over from the school in Rome by the selected prizemen are now on view in Paris, and here is what M. Dargenty says of them in the *Courrier de l'Art*:—"This time the show goes beyond all expression. Never before were the weakness, the incapacity, the ignorance of the pensioners in Rome manifested in so outrageous a manner. Up to the present the public had entertained a little respect for the old institution, for, although it is toothless, debilitated, and expiring, it was formerly regarded as the Alma Mater of Art. It is a shame to put before the eyes of the public such miserable refuse, such decrepit productions of a school that is falsely termed national, and of which the exhaustion is a forerunner of the last hour. How will it end? Will it comprehend before it goes that artists are not to be made in the same way as artisans, that art is not a trade with rules which are uniform for all the operatives, that whatever touches the spirit and the sense belonging to an artist finds something that is essentially susceptible, volatile, and imponderable, and that any influence that opposes the natural course may end in annihilating the original power?" There is more said in a severer manner, but the extract will suggest that the critics, like the artists, believe that the school must be reformed if it is to survive.

M. Charles Garnier has presented the costly work on the Paris Opera House to the library of the Institute. According to the old proverb one must not look a gift-horse in the mouth, but the volumes belong to that class of goods which publishers call "dead stock." At one time a proposal was made to issue the work in connection with *The Architect*, but from its character it would not answer. French architects know that a second Opera House like M. Garnier's is an impossibility. It would be necessary to have again the same kind of Government and the same kind of manners in society. People in Paris say, *apropos* of the revival of "Frou-Frou," that the play is a mirror of the life that was led under Imperialism. The Opera House may hereafter be taken as a symbol of that same life; and a few months since some archæologists visited the building, just as if it were a memorial of a past state of things that could not return. That may account for the building being so little studied as a model. It is a showy structure, but the style is overreached, and, as was once wittily remarked, M. Garnier, like a Mississippi captain, has won the race at the cost of an explosion. The quantity of metal in the building is sure to be an element of decay, and cracks were to be seen in the pavillons soon after completion. Apparently it was M. Garnier who honoured the Council when he accepted a medal, and in an excess of gratitude it is now sought to make him out a second Ictinus.

We have more than once remarked on the curious spectacle that has been presented in a court of the Louvre during the last five months by the collection of defective statues and casts that was deposited on one of the grass plots. There is an end to the sight, for the collection was sold by auction on Friday. At first the figures did not seem to be worth the cost of removal, but an enterprising broker paid no less than 36*l.* for them. One lot was carried off from him. It consisted of a large statue of Louis XIV., a still larger figure of a warrior, and the eternal *Truth Leaving her Well*, with sundry odds and ends, for 22 francs 10 centimes, or say 17*s.* 6*d.* There is an opportunity for the restorers who are attached to the establishments of the buyers. In due course the figures will appear in a condition that may amaze the curators of the Louvre, and as it can be said of them with more truth than usually accompanies descriptions of artistic masterpieces, that they are "from the Louvre collections," who knows but they may eventually find their way to one of the American millionaires who are such a blessing to Paris brokers.

The awarding of medals in an exhibition gives as little satisfaction as the selecting of designs in an architectural competition. The gold and other medals of the Liverpool International Exhibition are supposed to have been given with so little discrimination that in some cases the prizemen will not receive them. For instance, Mr. Fletcher, of Warrington, in a letter to the chairman of the Jury Committee, says:—"I regret to be compelled to decline to receive the gold medal awarded to me, and to ask that my name shall be erased from the list of awards. The shameful revelations in connection with these awards render this course imperative. I have no desire to have my reputation brought into question by the possession of 'honours' from such an exceedingly doubtful source." A firm of exhibitors who received three medals adopted the same course, considering that the medals, from the way in which they were adjudged, would be "of no practical use as advertising mediums." Some people say the medals were given by favour, others say the jurors were incompetent. One exhibitor complains that the jurors on leather were the same gentlemen who were inquiring into the qualities of the jams, inks, mineral waters, and food in general! The dissatisfaction will not add to the pleasure of the guarantors when they find they have to draw cheques to make up the deficiency.

According to the Birmingham masons there is nothing like stone for the walls of the new Assize Courts, and they made out a very good case when they appeared before the Mayor. However, the Corporation decided against them. Now it is the turn of the Birmingham bricklayers. They are no less confident about the superiority of terra-cotta over stone. But both trades could not pretend that they considered the subject in its architectural relation alone. The masons said that with terra-cotta there would be 30,000*l.* lost to the operatives of the town. The bricklayers maintain that statement is erroneous, for if stone were used it would be prepared to some extent outside the town. If the test of numbers is applied, the bricklayers say they deserve most consideration, since in Birmingham there are at least four bricklayers to one mason, and, while every bricklayer must have a labourer, one labourer can serve nine masons.

THE BLUE BOY.

IF any man can be considered as deserving of honour by French painters it is the experimentalist who produced the portrait of Master Buttall, the immortal *Blue Boy*. At a time when glowing reds and yellows were in favour, and when many colours were supposed to be indispensable in a good picture, he set aside all established canons by demonstrating that a masterpiece is possible should a painter be restricted to blue. The experiment was successful, but the modern painters of France are the first who have acted on it, and Gainsborough should be joined with Constable whenever the history of the existing school is traced back to its prime movers. If we wish to see the extent of the influence that was exercised by the two English masters we must visit a Salon exhibition rather than one of the Royal Academy. It is strange that Englishmen have to go abroad in order to be taught the value of two of their countrymen, but that is the fact. Even in the lecture-room of Burlington House Gainsborough appears to be ignored. He is supplanted by a crowd of Dutchmen, some of whom were not worthy to mix his colours or clean his palette.

It was only right that *L'Art*, as the leading publication of its class in France, should give the elaborate etching from the *Blue Boy* which we now reproduce, and which is a tribute to the memory of a man who has made French painters his debtors. It is one of M. Rajon's best works.

The *Blue Boy* made its mark when it appeared. Jackson, of Exeter, when writing of it, said:—"Perhaps his best portrait is that known among the painters by the name of the *Blue Boy*. It was in the possession of Mr. Buttall, near Newport Market." It was, in fact, the portrait of the son of the worthy Mr. Buttall. Father and son, like most of the inhabitants in the Newport Market region, have fallen into oblivion. All that is known of Master Buttall is that he served as a model for Gainsborough.

It is generally accepted that the picture was painted in order to refute a theory of Reynolds's about the danger of allowing blue to have prominence in a painting. "It ought," he said, "to be indispensably observed that the masses of light in a picture be always of a warm mellow colour—yellow, red, or a yellowish-white—and that the blue, the gray, or the green colours be kept almost entirely out of these masses, and be used only to support and set off these warm colours, and for this purpose a small proportion of cold colours will be sufficient." But it is remarkable that in the discourse which the President delivered after Gainsborough's death nothing is said about so noteworthy an experiment. He did, indeed, suggest that the painter was over-fond of colouring. "Gainsborough," he said, "having truly a painter's eye for colouring, cultivated those effects of the art which proceed from colours, and sometimes appears to be indifferent to or to neglect other excellences." Afterwards he said that Gainsborough's works were distinguished by a lightness of effect produced by colour to an unexampled degree; but "it must be acknowledged that the sacrifice which he made to this ornament of our art was too great—it was, in reality, preferring the lesser excellences to the greater." Reynolds made many experiments in colour, and probably was not satisfied that another painter could also make them as if they were only a diversion. Time has, however, proved that Gainsborough did not sacrifice everything to colour. If we take the *Blue Boy* as an example, do we not find that it owes its position among English portraits to the expression of character as much as to its novel scheme of colour? There were subjects that Gainsborough could not paint so well as Reynolds, but there were others which he painted better, and the *Blue Boy* is one of them. Nor is Gainsborough to be blamed because he recognised his own limitations. Would that Reynolds did so when he attempted historical pictures!

There was not only the power of rivalry to make Reynolds ungenerous towards Gainsborough, but as President of the Royal Academy he could not be enthusiastic about his rival's works. For he must have felt that Gainsborough was a living refutation of the advocates of an Academical system of education. A son of a Suffolk clothier, he owed his skill in painting to such teaching as was to be had in London, aided by his own ability. He had not made the Grand Tour, he was unread in books on art in foreign languages, he was not a worshipper of the "gusto grande." "When such a man as Gainsborough," said Reynolds, "arrives to great fame without the assistance of an Academical education, without travelling in Italy, or any of those preparatory studies which have been so often recommended, he is produced as an instance how little such studies are necessary since so great excellence may be acquired without them." Reynolds could not deny the force of the objection, and the only way he met it was by undervaluing the art of Gainsborough. For his class of subjects, said the President, the living world was sufficient. Gainsborough was not the man to acquiesce in shams. He reached his position in art by hard work, which he went through with as much fervour as if it were only a boy's game in the fields, and he could not believe that a better course was to be found in listening to professors who were doing their best to persuade themselves and their auditory that they were eloquent. Gainsborough was supposed to be frivolous, but he was wiser than the educational reformers who believe they can make artists by methods which they have been unable to apply in their own cases. He was not at his ease in the new Academy, and was obliged to retire from it. But the change made no difference in his position, for too many of his contemporaries believed him to be the first painter of the time.

ARCHITECTURAL ILLUSTRATION SOCIETY.

NO. 32.—AVENUE OF HALL OF COLUMNS, KARNAC.
NO. 33.—DESIGN FOR A COUNTRY HOUSE.

THE ARCHITECTURAL ASSOCIATION.

THE first ordinary meeting of the Association was held last Friday evening, the President, Mr. J. A. Gotch, in the chair. Mr. E. C. Hanson was elected a member. Votes of thanks were passed in connection with the conversazione, including a vote of thanks to the ladies and gentlemen who kindly assisted in the concert, to the Institute, to the exhibitors, &c.

The President then distributed the prizes to the successful students. The prize list was published in the report of the conversazione which appeared in *The Architect* for October 15. The name of Mr. Woodward appears in the list as winning the sketch-book title-page prize. This award is for the session 1884–85, which award was still *sub judice* when the prize list for that session appeared in *The Architect* of October 16, 1885.

The award for the session just ended has not yet been made.

Mr. H. D. Appleton, hon. secretary, announced the death a few days previously of Mr. H. J. White, a hard-working student, who this year had succeeded in winning the Architectural Union Company's prize, a success which, sadly enough, had come too late.

The President's Address: The Beginner's Prospects.

The President having begun with a remark as to a future Bunyan of the profession writing an "Architect's Progress" of adventure and misfortune, said:—Ours is, indeed, an arduous profession, and it is with no light heart that those who have the shaping of a young man's destiny should thrust him upon it. Ten years of toil may, perhaps, fit him to cross the threshold of independent practice. But to many that door is never opened, while to others it opens twice—once that they may enter and once that they may go forth, either to rejoin the army of those who work for others or to seek some different occupation, where the reward will be in greater proportion to the toil. In greater proportion—ay, there's the rub. Surely no one will become an architect hoping to find a fortune. If he works hard during the day and for a little of the time that other men devote to tennis or billiards, a conscientious man may manage to live and an unscrupulous man may do even better; but, as for fortunes, they fall to few in the architectural world. No! let him who enters for the race do it not for the prize but for the pleasure of running. If by good luck he gets the prize, then is he doubly blessed; but if not, he still has the delight of exercising fine faculties in a masterly manner. This, however, is perhaps a refined joy that it is not in every one's nature to experience, and therefore I say let those who regard the practice of architecture as a money-making pursuit turn their eyes in another direction, or they will find themselves mistaken, when, perhaps, it is too late. I do not deny that there are architectural practitioners who turn out much lucrative work at five per cent. and a good deal less, and in their work is patent the very natural desire to do as little as possible for the money they get. But

the architect and the architectural practitioner are widely different beings, and it is for the benefit of the former, and not of the latter, that this Association is maintained. The spirit that should animate the architect, in common with all artists, is not the commercial spirit of doing no more than is absolutely necessary to avoid reproach and reprisals for non-fulfilment of contract, but rather that nobler spirit that aims at reaching its own ideals, even if in doing so it gives more than was expected or bargained for. Satisfy yourself as well as your client—

> To thine own self be true,
> And it must follow, as the night the day,
> Thou canst not then be false to any man.

In designing a building, no matter how humble, ask yourselves two questions—first, Will this please my client? secondly, Would this please the visitors of the class of design? Once fairly embarked upon the sea of architecture, the most vivid impression one receives is from its limitless extent. There may be an ultimate shore of knowledge to which the architect may attain in time, but it is far below the horizon at the outset; and not infrequently it happens that when the voyager has left land so far behind as to render return impracticable, the outlook becomes rather dreary, for retreat is difficult, and there is no goal visible. The best thing to do, then, is to keep your eyes in the boat. Pay heed to the handling of the craft, and she will carry you into harbour sooner or later. This magnitude of the outlook, this feeling that no knowledge comes amiss, is at once the despair and the joy of the architect. On the one hand, it induces a feeling that no length of life and no strength of memory are sufficient to acquire and retain the information which it may be essential for him to have at any moment; on the other, it assures him that no day need be wasted, no experience fruitless. Consider for a moment some of the calls that may be made upon him. He may have to design a church, which implies an acquaintance with a special form of ritual; or a chapel, which, while possessing many points in common with a church, should yet be conceived in a wholly different spirit. His next work may be a school, towards which a knowledge of religious architecture will help but little. To design a row of cottages, with appropriate arrangements and internal fittings such as will draw forth the commendations of the inmates, implies a considerable knowledge of the habits of the poor; while a gentleman's house could never be fitly designed by one who had not mixed with gentlemen. These are but a few samples of work which might fall to any architect's lot. Other buildings would call forth even more varied acquirements. A set of farm buildings, a range of stables, a bank, and a public-house require a more intimate acquaintance with man and beast than any ordinary person would seek. Of course, much of this knowledge can and must be acquired by special effort as each case arises. It is really a matter of mastering your brief. But the knowledge must be acquired, and the more completely it is digested the easier will be the task and the better its results.

An architect ought to be a man of wide sympathies, able to view things as much from the standpoint of others as from his own, able to throw himself into various parts as completely as an actor, and above all, perhaps, able to realise as he draws what will be the actual effect of his drawing in execution. All this he should be in his capacity as planner, that is to say, while reducing into working order the various points of the problem. In addition to this he must be able to clothe the result of his contrivance in fair outward garments that shall appear well, not only in the elevations, but on the perspective too. And this implies a long course of study of architecture, as usually understood by amateurs, that is to say, of the Five Orders, of the arch, of proportion, of fenestration, of rhythms, of light and shade, of mouldings, and of all the other headings into which treatises on architecture are divided. But all these things, if not preceded by well-contrived practical arrangements, are but as sounding brass and tinkling cymbals. What are the student's prospects for fitting himself for his work? It must be admitted that he is better off than his predecessors. The facilities for acquiring knowledge, at any rate in London, are increasing year by year, and the student of to-day has a more defined and easier path to follow than the student of thirty, twenty, or even ten years ago.

First and foremost among the brighter prospects is the renewed activity of the Royal Institute of British Architects. This body has an age and a prestige which necessarily weigh much with the public; and if it keeps pace with the times, as it bids fair to do under the new charter, it will be an invaluable instrument in consolidating the profession, in training students, and in maintaining a high standard of professional honour and ability. The new charter, gentlemen, will inaugurate a new era in professional matters. It is earnestly desired by all the best men, and should any persons take upon themselves to oppose it, they will find themselves out of sympathy with the ablest, and most influential, and respectable part of the profession. But, to my mind, its most important action of recent years, and one which will have as far-reaching effects as even the obtaining a new charter, is the institution of the compulsory examination. This, gentlemen, is the first step towards establishing a universal test of competency for all practising architects, and I earnestly beg you to support the movement heartily by passing the examination yourselves, and doing what lies in you to induce others to do so too. First of all, it is a certificate of competency which must be of use in starting business on your own account. Then it helps the public to distinguish those who have had a recognised architectural training from those who merely slip into a practice, or endeavour to gain a spurious prestige by the addition of initials to their names, conferred rather as the mark of a subscription duly paid than of any architectural merit. All of which tends to the detriment of the architectural status generally, and to the confusing of good work and bad. Finally, the mere effort of going through an examination is of service to the student, as it helps to crystallise much knowledge hitherto in solution, and to show him where his strength and his weakness lie. The effort while the student-days are yet passing is a mere nothing, but when the active practice has begun it becomes a matter of difficulty to find the time amid the engrossing cares of responsible work.

To all young students of architecture I say—Regard the passing of the Institute examination as the first landing on the long staircase that leads to fame.

Having referred to other opportunities, the President continued:—I have touched upon some of the means by which students can prepare for the examination of the Institute, and less with the view of tabulating them for immediate use than of drawing a moral from them. And the moral is this—that it is highly desirable that some more concentrated system should be established. It may be said that ample means already exist for the student to gain the information he wants, but how can he avail himself of them when they lie wide as the poles asunder, and occur with no due sequence of time? What is wanted is a definite, recognised course of study, to be followed in conjunction with office work, and to a large extent during working hours. It is not fair to students to expect them to work all day, and then to apply themselves with unflagging energy to a serious course of study in the evening. There may be offices where pupils do not at all times get wearied with what is put before them to do. But there are also many offices whe day's work is quite as much as ought to be expected from a young man in a day, and from which he would issue in the evening not altogether fitted for making the best of further opportunities for study.

This question of concentrating the opportunities of education is, I am glad to say, now under the consideration of a committee appointed by the Institute, and we may hope before long to have valuable suggestions, not only how to make use of the existing multifarious and conflicting means of learning, also, I hope, for a further departure in the direction of establishing a central educational agency.

But there is no reason, because no regular highway to knowledge is yet formed, that we should not struggle manfully along such tracks as we have. Our present system of education is pupilage. Then, pupils, extract as much information from your principals as you can. Get to know the reasons for everything. I well remember how hopelessly I used to flounder about when I was a pupil, and to wonder whether I should ever learn the system upon which plans were devised, or under what circumstances one ought to use certain strengths of timber. Things became clearer after a time, and when I began to feel a real interest in the work; but for some years I felt that I certainly should never know enough to start work on my own account—everything seemed so vague and shifting; but, then, I was taught in the country, and did not know even of the existence of the Architectural Association. These things I mention in case any beginner may be in the same plight. Stick to it, and the atmosphere will gradually clear. One way of learning is to do thoroughly what you have to do. Let every line you put on the paper have its mission. Have a reason for putting every door and window in one place rather than another. Think everything out as carefully as a move at chess; learn the meaning of every phrase in a specification, and put nothing in from one to another that is not applicable to the new work. By such means you will save yourselves much subsequent worry and many reproaches, and you will be spared the mortification of hearing that your bedrooms have no wall-space for the bed or your drawing-room for the piano, or that you have called for extravagant work in a cottage, where every halfpenny has to be saved. Depend upon it, the three qualities of thoroughness, exactitude, and neatness, though they will not make an architect, will go far to help an architect to live.

The President considered how the opportunities of students in the country could be improved, these opportunities being mainly office-work and private study, and concluded by dwelling on the importance to an architect of a thoroughly good school education.

Mr. R. C. Pink proposed a cordial vote of thanks to the

new President, his successor in the chair, and spoke in very complimentary terms of the President's literary abilities.

Mr. M. B. Adams seconded the vote. His advice to students, he said, was "Work hard," adding that his experience was that the best men came from the country, thus showing that those who had the least opportunities had made the most of the opportunities they had.

Professor Kerr expressed the interest he always felt in attending the important meetings of the Association. It caused him the most extreme satisfaction to see the prosperity of the Association so well sustained. The President, he observed, had given an account of the profession which might discourage many. He hoped it would not discourage any of the students present. He proposed to turn to another view of the profession. It was remarkable that the building interest was the second great industrial interest in England. It held a field second only in extent to that of agriculture. Consequently no one with a head on his shoulders who learned his business in an architect's office, no matter in what way, need apprehend failure if determined to do his work in some one sphere or another of building in the interest of the public. He had witnessed great changes in architectural life during the last twenty years, changes almost as great as those which had been astonishing people in social life. The outcome of it was that we were being rapidly Americanised. Nature would have its way, and much that was old-fashioned and severe in various elements of respectability was giving way to a new system. As young men, they must face that system. They must not look back. However painful it might be, they must look forward to the new ideas that were arising, ideas which were commercial. Professor Kerr said he was not a commercial man, nor did he advise them to leave the sentimental side of their profession. In saying the building interest was so large, that was to be interpreted that there are a great many directions which a young architect might devote his attention to, and if one did not suit him he might turn to another. So also with art and with science. Architectural knowledge was acquired not in a school, but in the rough and ready training of an English architect's office. As compared with French architects, English architects were thoroughly practical. The French were exceedingly graceful in the use of the pencil, but they were wanting in the business and administrative qualities that distinguished the Anglo-Saxon race. The English architect combined in himself, as no other professional man in England did, certain elements of business that were antagonistic. Art and science were antagonistic to each other, and business was antagonistic both to art and to science. All three were combined in architectural practice. If, therefore, the young men would pay attention to the work they had to do in architects' offices, whatever the work might be, much or little, if they studied art, science, and administration, then, in the coming decade, if they found a difficulty in one branch of work they would find a dozen other ways open to them. The subsidiary arts were rising up in England in a marvellous way. In these they would take the pre-eminence over those who were educated in an upholsterer's shop, which would enable them to acquire opulence. Not only so, but they would cut out the engineers. Why should not architects design the great bridges and roofs of the present day? An engineer could not accomplish the design of grace because he was not brought up as they were being brought up. In concluding, Professor Kerr remarked that in the next generation a variety of fields of administrative building business would be found, not purely commercial but connected with commercial interests, and which would open out many channels of work.

Mr. W. M. Fawcett, of Cambridge, said it was the first time he had attended a meeting of the Association. The Association had always been a distinctly educational body, and therefore ran on lines parallel to those of the Institute. The Association had always appeared to him to be the handmaid of the Institute. He hoped they would always work together, as he believed they had hitherto. He had asked people what they meant by federation of architects. Each person gave a different answer. However, the whole question had been so thoroughly discussed and thought out, that he hoped some practical outcome would be the result.

Mr. H. L. Florence said the President had begun by alluding to Bunyan, and he could not help thinking it a good omen when he remembered that the pilgrim, at the end of his journey, reached the city which was paved with gold. Mr. Florence then said that if the students of the Academy were a much larger body they would have more influence, and, speaking of the Association, said that when they wanted anything they generally got it. Professor Kerr, he thought, spoke disparagingly of French architects. His experience was that French buildings were carried out without failures, without faults of construction—buildings such as we did not see here.

Mr. J. D. Matthews expressed their regret that the President was unable to attend the conversazione, and that they were glad to welcome him.

Mr. Tarver considered that our modern architecture was able to hold its own with that of any other country. Much harmony of style was becoming apparent in both London and country architecture, and in regard of detail several of what were features of the day had come into existence from the requirements of the age, of building acts, &c.

The vote was carried by acclamation.

Mr. Gotch, in acknowledging it, said his accident a fortnight ago was not very serious; it was caused by a treacherous bicycle. As to pupilage, he by no means wished to abolish it, but rather to supplement it.

THE BARONY CHURCH COMPETITION.

A MEETING of the heritors of the Barony parish has been held to receive reports by the minister and committee on voluntary assessment, and, if approved of, to consent to the erection of a new church.

Dr. Marshall Lang said that in February 1884 the landward heritors intimated a consent to the erection of a new church, on condition that the minister should report that a sufficient sum had been raised for that purpose. The first duty, therefore, of the kirk-session and himself, after the movement had proceeded so far, was to forecast what sum they regarded might be required, and the amount likely to be realised, and after careful consideration they fixed the sum at 13,000*l*. Selected architects were next invited to offer competitive designs, and of the designs submitted by ten architects of professional standing that of Messrs. Burnet was selected. The contract for the work had been divided into three sections, the first including the church, with vestry and the session-house; the second including the rooms and hall; and the third the caretaker's house, with whatever might be required in the shape of premises for the High Church or additional hall accommodation. The first of these contracts, which would come to a little over 11,000*l*., was fully covered, as would be seen from the statement to be submitted by Mr. Galbraith, treasurer. He did not mean to say they had got all the money that was required, but he confidently reckoned that they would yet get 2,000*l*. In the first place, the congregation of the Barony Church had resolved to make a new effort to raise an additional 1,000*l*., and there were many friends who had not yet fulfilled their announced intention of contributing. In concluding, he trusted that the meeting would consent to the erection of the church, and it would be the desire of those in charge to proceed at the earliest possible moment with the work. No time should be lost. Work was very cheap and very scarce at the present time, and the building would be a great boon to many workmen in the city of Glasgow.

Mr. Galbraith then submitted a statement showing that 9,190*l*. had already been subscribed towards the erection of the new church, while the sum of 3,382*l*. had been promised, making in all a total of 12,572*l*.

The Chairman (Colonel Hozier) said that, having heard the statement by Dr. Lang, which showed that a sufficient sum of money had been raised, he formally proposed that they agree to the erection of a new church being proceeded with. The resolution was adopted.

The following is a description of the new building, plans of which were shown at the meeting:—The church consists of a wide nave and narrow side aisles, with a transept on one side. By this plan the greatest possible number of the congregation obtain an uninterrupted view of the minister, and are consequently more able to hear him. A chapel or second transept is placed on the east side of the chancel, so to speak, behind the minister. This may be thought an unusual arrangement and not likely to be agreeable to the sitters there, but the pulpit being placed on the opposite side of the nave, the preacher speaks obliquely across the chancel, so that this part of the congregation will not be exactly behind him, but in much the same position as the majority of the congregation in St. Giles's, Edinburgh, where the minister is easily heard. The organ chamber is placed in the transept west of the chancel. The choir seats, the communion table, and elders' seats occupy the back or north end of the church, and galleries are placed in the east transept and at the south end of the nave. The hall and committee-rooms are so placed and connected with the church that they may be used either independently or with each other. The session-house is close to the church, and the division walls are so constructed (of timber screens) that it can be connected with the chapel or chancel transept and used as an overflow for the church. The vestry is in close proximity to the chancel or session-house, and all these rooms look out upon Cathedral Square. A ladies' room is placed on the ground floor of the caretaker's house. The main entrance is at the south end of the nave, but the east porch is large and spacious, and can, if desired, be used as the principal entrance, as all the galleries may be reached from the interior of the church. There are three exits from the nave, independent of other three for the galleries, and the minister's entrance from the vestry and

session-house. The buildings are worked out in a somewhat Scotch development of the Early English style, a style specially favourable to the monastic grouping, and severe simplicity of detail is imposed alike by the requirements of the site and the smallness of the sum of money at the disposal of the committee. The exterior is to be entirely of common or square-dressed rubble freestone. In the interior the walls of the nave will be finished in plaster, except at the windows and arches, where polished stone will form the surface. The walls of the chancel will be entirely of polished stone, except in the spaces intended for mural decoration. The roof, an open timber one, is to be of red pine, and all the pews of pitch pine, the elders' and choir seats, organ case, &c., being of hardwood. The floors, with the exception of that of the chancel, are to be of timber, the chancel being laid with tiles and marble of a very simple design. The session-house is to be panelled to the height of 5 feet with wood, but the walls of all the other apartments are simply to be plastered. The windows are to be filled with simple leaded glass work of a very pale tint, except in the chancel, where the tints may be violet, and ultimately figure work may be used. The heating is to be effected by means of a low-pressure system of hot-water pipes placed in the chancel below the passage and round the walls, and in the other rooms above the floor. Each set of rooms can be heated separately, and the whole will be under the control of the janitor in the basement of his house.

THE JUBILEE CHURCH HOUSE.

THE proposal to erect a Church House by an architect of the highest standing has not given satisfaction to Mr. Cavendish Bentinck, who has sent the following protest to the secretaries :—

"Gentlemen,—I have the honour to acknowledge the invitation to join your Committee, which, by the desire of His Grace the Archbishop of Canterbury, you have forwarded to me, but I regret to acquaint you that I cannot support a proposal to erect a new Church House of large dimensions and at great expense, because it is evident that the clergy of the Church of England would be practically the promoters of the scheme, and as their leaders have no acquaintance and no sympathy with the ideas and works of the great architects and masters of art of the sixteenth, seventeenth, and eighteenth centuries, it follows that the funds subscribed would be handed over to some so-called 'Church architect,' who would proceed to add to the list of the costly architectural failures which are almost daily committed throughout our native country.

"But I will not limit this communication to a mere objection. I will venture to offer a practical suggestion for the consideration of your Committee, and as follows :—I have myself been long engaged in defending the 'City Churches,' and recently also 'the Charterhouse,' against the assaults of destroyers, and I am of opinion that if a 'Church House' be deemed a necessity for the Church of England, the 'Queen's Jubilee' would more fittingly be celebrated by adapting to such a purpose beautiful and interesting structures whose existence is precarious, rather than by rushing into extravagant experiments, which might produce even worse results than the new Law Courts or the new Sion College. But if the buildings to which I have referred be considered inconvenient, permit me to point out that the 'Chapter House' of Westminster Abbey might be well utilised for Church gatherings. It stands in a central situation, is admirably adapted for large meetings, and I, as an old Westminster, should rejoice to see this noble space rescued from the useless and degraded position it now occupies, and relegated to a purpose not materially different from that to which it was originally dedicated.

"I have the honour to be, gentlemen, your obedient servant, "George Cavendish Bentinck.

"Venice : October 15, 1886."

THE VENICE EXHIBITION.

PREPARATIONS for the National Exhibition of Fine Arts which is to take place in Venice next spring are already in progress, and the beauty of the public gardens has undergone a temporary disfigurement in the shape of unsightly hoardings and other signs of building operations. We think, however, says the *Venice News*, that the best, if not the only practicable site, has been chosen, and hope that the works will be pushed on with sufficient vigour at once, so that the structure may be ready for occupation by the date required, and if possible be got sufficiently dry to avoid any great risk of injury to the articles which will have to be exhibited there. The works now in progress extend from the bridge at the entrance to the gardens right along their whole length to the further end, but the large trees and main walks will not be disturbed. A temporary wooden bridge has been erected over the canal dividing the gardens from the rest of Venice, to give access at present in place of the one just referred to, and the devotees of walking exercise can still find some space for the stretching of their limbs, though the prospect is limited to the fatal mud-banks and shorn loveliness of the ill-starred island of St. Elena.

Correspondence

Architectural Federation.

Sir,—In consequence of the publication in last week's professional journals * of a circular letter from the Institute on this subject, we feel it necessary to send you a few remarks which perhaps you may find space to insert in this week's issue.

It is almost inconceivable that any members of the Institute who duly read our circular can have signed the accompanying declaration under the impression that it emanated from the Institute. The circular distinctly states that it is based upon resolutions passed at the general conference held in the Freemasons' Tavern, which all must be aware, from the notices sent to every architect in the kingdom, was not convened by the Institute.

We regret that at a time when the idea of consolidating the profession is within measurable distance, the Council of the Royal Institute of British Architects should appear to be endeavouring to divert the attention of its members from the all-important question of obtaining an Act of Parliament to close the profession in future against all but duly qualified men. Apart from obtaining such powers, we recognise no practical meaning in the term Architectural Federation, and nearly 1,300 architects have endorsed this view of the question.

We are of opinion that the existing charter of the Royal Institute of British Architects would be no bar to obtaining the proposed Act, but the fact of a *new* charter having been granted to the Institute immediately before the presentation of a Bill to Parliament would certainly retard, if not altogether defeat, this object.

The Institute's circular letter states that the report of a special committee of the Institute now sitting to consider the matter of architectural federation may be presented to the Council before the close of the year. We fail to understand how the Council of the Institute can appeal to their members to fix their hopes on this committee, which, having been sitting six months, has announced that its report will not appear till after the application for a new charter, the granting of which may fatally prejudice architectural federation.

We also take this opportunity of stating that there was no intention, as it is clear from the foregoing observations there could be no object, to exaggerate or to suppress in our circular any of the facts connected with the origin or constitution of our committee. The names of the gentlemen serving on it will be sufficient guarantee to the profession that this is the case.

Our circular does not appear to have reached more than about 2,500 architects, of which number, as before mentioned, about 1,300 have signed a declaration as follows :—

Whereas we the undersigned are of opinion that it is for the benefit of the public and the architectural profession alike, that legislative powers should be obtained, so that all persons hereafter entering the profession shall be duly qualified by examination. We are desirous that committees should be formed to promote the object in view, and to obtain the necessary Act of Parliament.

It will greatly facilitate matters if all architects who are in sympathy with the movement will send in their names and address immediately to the honorary secretary, Mr. Edgar Farman, 39 King Street, Cheapside, E.C.

The Institute has now an opportunity which we hope it will embrace of yielding to the wishes of a majority in the profession, by postponing the application for a new charter and carrying out this great reform.

Signed on behalf of the Architectural Federation Committee. Hugh Roumieu Gough, Chairman.
Edgar Farman, Hon. Secretary.

October 26, 1886.

Sir,—Will you allow me to answer Mr. E. T. Hall's letter on this subject, and in doing so some other letters which have been published in the professional journals.

The Federation Committee have simply asked an answer to a distinct question, which is, "Do you desire by Act of Parliament to close the architectural profession, so that hereafter only duly qualified men can act as architects?" Mr. Hall and

* As is explained elsewhere, we were unable to find space for the letters on Federation last week.

others, quite putting on one side this, the gist of the whole matter, try to smother the effort to obtain the necessary Act of Parliament, and excuse themselves for not joining it (although they are obliged to agree with the object of the movement) by raising all sorts of side issues, such as to the correctness of the wording of some of the circulars; as to what shall be the qualifications under the Act; as to the constitution of the Committee; as to the position or qualifications of the members of the Committee. Even granting some inadvertence in the wording of an accompanying circular is liable to be misunderstood, even granting the Committee was not composed of the best men, what have these side issues *in the smallest degree* to do with the question? They do not affect it one iota.

Members of the profession have not been asked to agree to the circulars; they have not been asked to vouch for the competency or the position of the Committee's members, but simply to say aye or nay to a question affecting an object which is clear and distinct and of the first importance.

Why stay to question the exact quality of the materials, or the construction of the bridge, when it will carry you over and you are in haste to go? The question is, indeed, too serious a one to the public and profession alike for it to be thus trifled with. Incompetency on the part of members of the profession means (as at present it does very often), for the public, loss and even death. Much of the business for the law courts arises from this fruitful source, and in consequence of it insanitary dwellings are no novelty.

Now, sir, I ask the Royal Institute of British Architects, and any other societies and persons who agree with the principle and try to cavil at unimportant details, why they cannot sink petty jealousies and work together for a common good. As to the Royal Institute of British Architects, they certainly have had the question before them for many years, and have also had, as Mr. Hall says, committees on this question before this one. These facts can hardly be to their credit, as they have as yet done nothing; while the Federation Committee, which has not yet been in existence six months, has obtained such special support from the profession in all parts, and to such an extent as to outnumber the existing architectural societies in the United Kingdom. They have not obtained this by sitting still, but by having the one good object in view and giving both the necessary time and other support which has been required from them.

The Council of the Royal Institute of British Architects would not act on this Committee when asked to do so at its election, at which election Mr. Hall himself was present. Still the members of the Federation Committee are, I believe, now, as they were and as they have always been, not only ready to act with the Royal Institute of British Architects in this important question, but to efface themselves so far as the "lead" in this movement is concerned; but they will not let the matter be dallied with or crushed out. They have put their hands to the plough; they will welcome more help and more hands, but they will not turn back.

May I say a few words as to the Federation Committee's reason for opposing the proposed new charter of the Royal Institute of British Architects. It was not because they are hostile to the Royal Institute of British Architects, or because they have any desire to prevent any society from obtaining a separate charter; but they believe that the present moment is inopportune, and that the granting of powers to the Royal Institute of British Architects to have a compulsory examination for those wishful to enter only its special ranks is useless, and will in no way protect either public or profession from any chimney-sweep, if he likes, opening an office and calling himself an architect.

Nothing but the course proposed by the Federation Committee—namely, that of obtaining a Registration Act, similar to those for the medical and dental professions—ever will attain that object, and the Federation Committee consider such object far more important to all alike than any charter to any individual architectural institution.

Our desire is to conciliate, to avoid further cause of jealousy, but honestly to carry out the object which it seems is in favour with all. Why cannot all alike help for the "common weal," and, if they think we are weak, make us strong?—I remain, yours truly,

WALTER EMDEN.

36 Southampton Street, Strand, W.C.: October 1886.

SIR,—At a special business meeting of the Leeds and Yorkshire Architectural Society, it was proposed by Mr. C. R. Chorley, F.R.I.B.A., seconded by Mr. J. W. Connon, F.R.I.B.A., and carried unanimously, that the following resolution be sent to the Royal Institute of British Architects, the architectural journals, and various architectural societies:—

Resolution.

"The Leeds and Yorkshire Architectural Society (Incorporated) congratulates the Royal Institute of British Architects on the completion of its proposed new charter, and repudiates in the strongest manner any share in the opposition to its adoption which is being threatened by a non-representative architectural society."

Yours faithfully,

GEORGE BERTRAM BULMER.

Infirmary Street, Leeds: October 27, 1886.

SIR,—We are instructed by the committee of the Architectural Association to state, in reference to a circular issued by Messrs. Roumieu Gough and Edgar Farman, that the Architectural Association is not represented or connected in any way with the Architectural Federation Committee.—Yours faithfully,

HERBERT D. APPLETON,
THOMAS EDWARD PRYCE, } Hon. Secs.

Architectural Association: 9 Conduit Street, W.

New Barony Church.

SIR,—As we fear that Mr. John Honeyman's letter, published in your issue of the 22nd, may mislead those interested in the affairs of the Barony Church, we would be obliged by your finding space in your columns for the following facts.

In answer to the invitation of the committee, we submitted two designs, unfortunately (in so far as our doing so seems to have resulted in this discussion) described in our report as one. One showed a church with a spire, in deference to what we thought might naturally be the wish of many members of the church, at an estimated cost of 15,600*l.* The other showed the church rearranged, and with a large western porch in place of the spire in the other design, at an estimated cost of 13,000*l.* At the same time we urged that in consideration of the surrounding features, and also in consideration of the small sum of money at the disposal of the committee, that the spire should not be built. We understand that our costs were verified by the measurers acting for the committee. It was intimated to us that the committee had accepted, according to our recommendation, the design without the spire, and we were instructed to prepare contracts for the execution of the work. This has been done, and the committee are now in possession of tenders which verify the accuracy of our probable cost.

Yours faithfully,

JOHN BURNET, SON & CAMPBELL.

167 St. Vincent Street, Glasgow: October 26, 1886.

SIR,—As one of the architects invited to submit designs for the New Barony Church, like Mr. Honeyman, I consider that I have been badly treated by the committee. The conditions of the competition were framed in a most specific manner, which would satisfy any competitor.

"Clause II. That the church, hall, classrooms, officers' house, all professional fees, heating, lighting, painting, &c., shall not exceed 13,000*l.* Deducting fees, left 12,000*l.* for buildings."

Keeping this sum strictly in view, I submitted designs which several eminent architects believe could be carried out for the sum named. Mr. Honeyman and I were the only competitors who complied with these conditions. I asked the committee for a copy of their assessor and measurer's reports, and have tried in vain for four months to get any satisfaction from them. The motto affixed to my designs by the committee was "No. I.," but when my designs were returned from London "No. III." was marked on each of them. I do not know whether the III. meant order of merit or not, and am in a fix unless I saw the report of the assessor.

Estimates have been received for part of the accepted designs, and I understand the mason work is about 10,000*l.* You will see that my grievance is established.—I am, &c.,

WILLIAM F. MCGIBBON.

Glasgow: October 25, 1886.

SIR,—I shall feel much obliged if you will permit me to pass a few remarks on the above by way of a reply to Mr. Honeyman's frank request. From your report of the transaction I look upon Mr. Honeyman as an architect of high integrity, and far above all trade pettifogging meannesses, and as one of those who are the only real supports of our profession. I think Mr. Pearson has acted honestly, inasmuch as his "only duty" was to present a fair report to the committee, which doubtless he has done, and, having so done, should do no more; but I gather from your report the fault lies in the apparent "purpose-dark" secrecy of the committee.

Has Mr. Honeyman in any of his communications in any slight way roused the ("usually tender") susceptibilities of the committee? If Mr. Honeyman, after careful reperusal of the copies of his own written letters, &c., finds nothing in them which could possibly be translated as offensive, or in any way but of the most gentlemanly and careful phraseology, and is not afraid of losing a little gold in the event of the case being decided against him, then I do urge him most assuredly (if his lawyers concur) to vindicate his right to expose this "in all

published appearance" ungentlemanly committee, and to have sufficient courage to be the first to endeavour to stamp out for ever the evil practice of exceeding the stipulated sum in architectural competitions; which sad practice has been much in use and encouraged by even eminent men, and is certainly not conducive to the promotion and advance of the profession in public opinion.

What a base world it must be in which we live *if* it is *possible* for a "Christian Church" committee to act in so unworthy a manner. I sincerely wish Mr. Honeyman every success.—Yours obediently, F. E. Thomasson.

October 25, 1886.

Edinburgh Municipal Buildings Competition.

Sir,—I have received, I presume in common with all other competitors, a notice from the Town Clerk of Edinburgh, to the effect that the authorities have abandoned their intention of acquiring the property forming part of the main frontage of the site of the proposed new Municipal Buildings, as shown on the plans of site issued with the instructions to architects. As my plans are nearly completed, this modification of the site involves the reconsideration of the whole design. In my judgment the authorities ought to have stood by their original instructions, and, after selecting the best design, instructed its author to alter it; or at least an apology for the vast amount of additional labour thus thrust upon competitors, and an extension of the limits of time, should have accompanied this notice of modification of site.—Obediently yours, A Competitor.

October 27, 1886.

Damp Spots in Water-Colour Drawings.

Sir,—In reply to "Collector No. 2," I beg to state that the damp spots referred to occur chiefly in the lightest parts of a lightly-washed grey sky (the drawing being on brown-grey paper), being apparently most numerous where the colour laid on is thinnest. How would it do to have the defective parts carefully stippled over in body colour? Would the damp again make its appearance if the drawing were so treated? I shall be greatly obliged for any helpful hints in this matter.—Yours faithfully, Collector.

CHURCH BUILDING AND RESTORATION.

Faulkburn.—The church of Faulkburn has been reopened after restoration. Mr. A. W. Blomfield is the architect, and Mr. R. Parmenter, of Braintree, the contractor.

Charlynch.—The church of St. Mary, on the Quantock Hills, has been reopened after repairs and improvements. The work has been done by Mr. H. J. Spiller, builder, from the designs and under the direction of Mr. Houghton Spencer, architect, Taunton.

NEW BUILDINGS.

Knowle.—Four cottage homes have just been built at the cost of Miss S. L. Barrow, of Milverton, Leamington. Mr. W. Hawley Lloyd, of Birmingham, was the architect, and Messrs. Smallwood & Sons, of Wootton Wawen, the builders.

Stoke-on-Trent.—The town-hall has been re-arranged and the assembly-room enlarged from the plans of Mr. W. Bowen, at a cost of 2,100*l.* Mr. Richard Bradbury was the contractor.

Kirkwall.—The municipal buildings erected at Kirkwall, from the plans of Mr. T. S. Peace, by Messrs. Samuel Baikie & Sons, of Kirkwall, have been opened on the occasion of the fourth centenary of the burgh.

Walsden.—Two corner-stones were laid on Saturday last at the new Liberal Club, Walsden, by Mr. James Schoefield, of Littleborough, and Mr. William Ormerod, of Todmorden. The building will be faced with Yorkshire parpoints and local dressings. The principal feature will be a large angle bay carried above the roof and finished as a tower. The joiners' work will be of pitch pine and Riga white panels. The whole of the work is let to local contractors. The architect is Mr. Jesse Horsfall, Rochdale and Todmorden.

Brentwood.—The foundation-stone of the Essex County Asylum has been laid. Messrs. Brass & Son, builders, are carrying out the work, from the plans of Mr. Stock. The contract price is 63,873*l.*

An International Exhibition is to be held at Saltaire in May in aid of the building fund of the new Schools of Art and Science, now being built from Messrs. Mawson's designs, at a cost of over 12,000*l.* The exhibition is to be chiefly of works of art, many of which are already promised on loan, and of industrial processes. It was originally intended to open the exhibition in June last, and advantage has been taken of the postponement to improve and extend the original plan.

GENERAL.

The Annual Exhibition of the Scottish Society of Painters in Water-Colours opened in Glasgow on Saturday. Over sixty pictures, to the value of 937*l.*, were sold on the first day.

Mr. Walter Ouless has painted a portrait of Mr. R. Benyon who has for over twenty years filled the position of Chairman of Quarter Sessions for Berks. The portrait has been formally presented to Mr. Benyon.

Mr. Frank Holl, R.A., is to paint a portrait for presentation to Lord Brassey.

An Art Union is proposed to be formed in connection with the Lincoln School of Art.

Mr. Norman Lockyer will distribute the prizes this evening to the students of the Reading School of Science and Art.

Casado de Alisal, one of the chief historical painters of Spain, has died in Madrid, at the age of fifty-four years. He was a native of Valencia, and was famous both as a portrait painter and as an historical painter. One of the best known of his paintings in this latter capacity was *The Legend of the Royal Monk.* Alisal was for some years Director of the Spanish Academy in Rome.

The Late Baron Meyer Rothschild has directed in his will that his famous art collection, after the death of the Baroness Louisa, shall pass to Sir Nathaniel Rothschild in London.

Messrs. Darbyshire & Smith, architects, have undertaken the designing of Old Manchester and Salford for the Manchester Jubilee Exhibition.

The Sketching Club of the Leeds and Yorkshire Architectural Society are displaying the whole of the drawings prepared during the recent summer months. Amongst the best are Mr. Alfred Whitehead's *Doorways from Lincoln Cathedral, Fountains Hall, Kirkstall Abbey,* and *Chantry Chapel, Wakefield;* Mr. F. W. Bedford's *Interior, Chester Cathedral; Lees Hall,* and *Fountains Abbey;* Mr. T. S. Ullathorn's *Hemingbrough Church;* and Mr. Frank Haigh's *Tower, Fountains Abbey.*

Mr. R. K. Freeman, of Bolton, has been appointed Surveyor of Ecclesiastical Dilapidations in the diocese of Manchester.

Mr. C. Flower has offered to bear the cost, about 740*l.*, of laying out the ground recently acquired by the Stratford-on-Avon Corporation for a public pleasure-garden.

The Annual Meeting of the St. Nicholas Stained-Glass Window Society, Newbury, was held last week.

The Aberdeen Mechanics' Institution propose voting 150*l.* for the erection of an ornamental wrought-iron gateway for the archway connecting the school of art and the art gallery.

Mrs. Woodhead, of Marshgrove, has given 1,000*l.* towards building a new church in Cleckheaton, Yorkshire.

The Western Baths, in Hillhead, Glasgow, after being closed nearly three years, are shortly to be opened by a private company, who have purchased the property for 6,000*l.*, or about one-fifth of the original cost.

The Bohemian Town of Kladno, with fifteen thousand inhabitants, is threatened with destruction, the old church, the town hall, several schools, and about sixty private houses being in a precarious condition. Whole streets are steadily sinking in consequence of the way in which the iron and coal mining underneath is conducted.

The House that was known as Owen Glendower Parliament House at Dolgelly was removed a few years ago, but the materials were purchased by Mr. Pryce Jones, who is now having the house re-erected on his own ground at Newtown. The original plan will be followed.

A Rumour has been circulated to the effect that Mr. William Emerson, one of the candidates selected to prepare drawings for the proposed cathedral at Liverpool, has accepted a lucrative appointment at the Cape, but it is entirely without foundation.

Mr. Silvanus Trevail, at the request of the electors of the Eastern Ward of Truro, has come forward as a candidate for a seat on the Town Council.

Mr. Bailey Denton, of the firm of Bailey Denton, Son & North, Palace Chambers, Westminster, was on Wednesday appointed consulting engineer by the Manchester City Council, to advise upon the scheme about to be carried out for the sewerage and sewage disposal of that city.

Archdeacon Hamilton, of Northumberland, and the Building Committee for St. Jude's Church, Newcastle-on-Tyne, have agreed to purchase the plot of vacant ground (also to buy and pull down the three houses adjacent thereto) situate at the corner of Clarence Crescent and Barker Street, Shieldfield, for the site for the church, and they have also appointed Mr. Arthur B. Plummer, A.R.I.B.A., of Newcastle, to be the architect for the building.

The Architect.

THE WEEK.

ON Saturday the Académie des Beaux-Arts met for the purpose of presenting prizes to the successful students and delivering discourses on deceased members. M. CHARLES GARNIER presided, and spoke with feeling of the late PAUL BAUDRY. The prizemen were as follows:—Architecture (*a Building for the Cour des Comptes*)—First prize, M. DEFRASSE; second, M. LOUVET; third, M. SORTAIS. Painting (*The Nomination of Claudius as Emperor*)—First prize, M. LEBAYLE; second, M. LAVALLEY; third, M. SINIBALDI. Sculpture (*Tobias*)—First prize, M. CAPELLARO; second, M. LARCHE; third, M. CHAVAILLAUD. Engraving—First prize, M. PATRICOT; second, M. CRAUK. The principal prizes mean residence in Rome. How many among them are destined to gain renown as artists? The Vicomte DELABORDE, the secretary, afterwards delivered an eulogium of PAUL BAUDRY. It is well known that the painter was born in a humble position and was discovered by a prefect of his district. An interesting letter from the painter to that functionary was read. In it BAUDRY said:—"I can see myself, a peasant boy, as I stood before you in 1844 and raised my eyes to your kind face. I was trembling all over, but a couple of words you spoke filled me with gratitude and confidence. You will not guess what they were. You simply said to my mother, 'Will you be seated, madame?' I have never before mentioned to you how much I was impressed by the words, but they were suggestive of so much good-nature that they became magnetic for me, and I still hear them." It will be remembered that the scene occurred in the reign of LOUIS PHILIPPE, when a prefect was supposed to be a very great man, and from whom courtesy to a peasant woman was not to be expected. Although peasant-born, there was not a figure by BAUDRY without elegance, and hence his works were well adapted for the *salons* of princes.

THERE is some dissatisfaction among the surveyors of Birmingham about the appointments of surveyors for the new Assize Courts. The custom in Birmingham, as elsewhere, is for one quantity surveyor to be appointed by the building owners, and another quantity surveyor by the builders, who have to make their tenders and base their liability on the quantities submitted. The usual commission for getting out these quantities is divided between the two surveyors, so that no additional expense is incurred by the arrangement. Mr. COUDERY has been appointed at the nomination of the architects, and will represent the building owners, who in this case are the Corporation. But without giving the builders any voice in the matter, the Corporation have appointed the second surveyor, who is Mr. HARRIS. This is a departure from the usual custom, which has no apparent advantage for the builders, who in a work of that kind naturally desire to have their own representative, and it resembles too much the MARTIN-CHAMBERLAIN monopoly to be acceptable.

THERE are shrewd people who believe that they can save money by dispensing with an architect when they are erecting a building. A firm of that kind have had an unpleasant experience in the Scottish courts. Messrs. STUART & Co., of Glenspey, in 1883 erected a distillery. The contract for the ironwork was given to Messrs. SMITH & Co., of Inverness. What could be more satisfactory than to allow Mr. JACK, a member of the firm, to offer suggestions on the work, and to give instructions from time to time? If a man had a hobby of that kind, it was friendly to afford him an opportunity to gratify himself; and moreover, 220*l.* could be saved, for that would be the percentage on a building costing 4,400*l.* But the distillers were amazed when they received a claim from Mr. JACK for 140*l.*—that sum being calculated at the rate of $3\frac{1}{2}$ per cent. on some work, and 5 per cent. on the remainder. They refused to pay on the ground that Mr. JACK was not employed by them; that when at Glenspey he was looking after his own workmen, and that any obligation was satisfied as they had presented him with a gratuity of 10*l.*, at which munificence Mr. JACK was greatly pleased. The Sub-sheriff, when he heard the case, decided in favour of the distillers, as he considered the acceptance of the 10*l.* was a proof there was no claim. He also applied the doctrine of *quantum meruit* to the case, and said it was based on the principle of implied contract; and with regard to certain classes of professional persons and others—architects, engineers, and the like—established a presumption of employment in the case of persons falling within any of those classes. The Sub-sheriff regarded this as the case of a man who was competent to act as an engineer, but who was not recognised as such in the profession, by the public, or by the defenders. Mr. JACK was dissatisfied, and brought the case to the Court of Session, where three judges combined to decide it. This time he was more fortunate, for the Court held that employment had been proved by letters, the evidence of the tradesmen who had charge of the carpenter work, and the expression of the defendants, "under JACK's direction." Messrs. STUART & Co. have the gratification of paying their friend's bill, and the expenses of two courts, and apparently no allowance is to be made for the gratuity. When next they build we hope they will act more economically by employing an architect and paying him 5 per cent. in full.

WE regret to learn that Mr. WILLIAM SCOTT is compelled, from want of support, to suspend the publication of the *Venice News* for the present. When the paper was started it seemed to be a promising venture, but the apprehension of cholera kept back visitors from the city, while the English and Americans who were residents deserted it. Venice in consequence suffered unexampled depression, and we often wondered how, under such circumstances, Mr. SCOTT could keep his journal afloat. He anticipates that he will be able to renew the experiment in the spring, and the *Venice News* was so well conducted that a temporary cessation of its appearance must be a loss to English and American visitors. Mr. SCOTT honourably announces that subscribers who have paid their subscriptions for the whole year can, if they wish it, have the balance corresponding to the period during which the paper does not appear returned to them on application at the office, otherwise the same will be carried to their credit account for the ensuing year.

THE late Sir GEORGE HARRISON was, it appears, an estimable citizen of Edinburgh, and of course it becomes necessary to raise a memorial to him. But, in spite of the esteem in which he was held, not more than 600*l.* can be obtained for the work. With such a sum there is necessarily a limit to the character of the memorial, and the best thing that could be discovered was a stained-glass window in St. Giles's Cathedral. But a building into which a visitor cannot enter without paying threepence—that is, a penny more than was charged for a sight of St. Paul's in the old days—is hardly a suitable place to display a record of one's virtues. So on consideration the window is given up. What kind of substitute is to be found? That question has to be decided by the Committee. The friends of the defunct say he was as good a man as ADAM BLACK, whose colossal effigy is in Princess Street, but no sculptor is forthcoming to produce a statue to correspond at a third of its value.

AMONG the recent discoveries in Rome may be mentioned a cylindrical altar, which was exhumed in the old gardens of Sallust. It is embellished by four small amorini in high relief, typical of the Seasons, and which are separated by ornament of an exquisite kind. *Spring* holds in one hand a basket of flowers, and with the other appears to scatter them. *Summer* has a weeding-hook in the right hand, and in the left is a cornflower. *Autumn* has the breast covered with the skin of a deer, which hangs from the left shoulder; the left hand rests on a basket of grapes and the right holds a stick. *Winter*, unlike the other figures, is robed; the left arm rests on some object which is not clearly defined, and the right on an amphora—a suggestion of the wine which is prepared in autumn for use in winter. From the purity of the style and the quality of the marble it is inferred that the altar belongs to the age of HADRIAN.

THE OPENING MEETING OF THE INSTITUTE.

IF tested by the standard which has had to be endured of late there was much to be thankful for in Monday's meeting at the Institute, and as things go now it may be said that the session began auspiciously. We need hardly say the proceedings were suggestive of a state of transition, for that appears to be the chief characteristic of the Institute during late years. The past is steadily ignored, the present is of little consequence, and attention is made to turn upon a future that somehow contrives to be evasive if not illusory. This time there is some ground for hope. The Conservatives are in office, and the Honorary Secretary can boast that he has acquaintances among them. He has promised to begin the exercise of this influence on the arrangements for the new Admiralty and War Offices, but when one is permitted to ascend the backstairs it is allowable for one's friends to let their imagination revel in blissful dreams.

The past could not be altogether ignored on Monday, for a bust of the late Mr. STREET had to be presented. But it was generally forgotten that as late as 1879 he was sacrificed to the new arrangements for finding officers, and apparently because he was less of a *viveur* than some other gentlemen. There is no doubt that Mr. STREET felt the disappointment, and the letters he wrote to us at the time made it plain that he suffered acutely when he was forced to resign his seat on the Council. The Presidentship would have been taken by him as a proof that his great fight against officialism received the approval of his brother architects, and at that time the duties of the office would have afforded a change from work of another kind. He could then have prepared his address without any strain on himself. Wiser counsels afterwards prevailed, and the office came to Mr. STREET, but he was a different man. It is unnecessary to allude to the end of the tragedy, but when the Honorary Secretary was drawing a moral from Mr. STREET'S career, the occasion might well be improved by suggesting that, while Mr. STREET was over-generous in his loyalty to the Institute, the recollection of his treatment in 1879 should give rise to compunction in some breasts.

The speech that was delivered by Mr. BLOMFIELD in presenting the bust on Monday was well adapted to such an occasion, and although brief was suggestive. He paid a tribute to the generosity of Mr. ARMSTEAD, R.A., the sculptor, for it has become the custom to substitute applause for coin of the realm when settling with artists for portraits of presidents, a circumstance which should be recorded for the information of the members of a later age.

Mr. I'ANSON'S address was excellent. Unlike some of his predecessors he never departed from firm ground, and kept himself to his own experience. Mr. I'ANSON did not pose as a legislator or an autocrat. There was no suggestion that he was to rule with a rod of iron. Something of old-world simplicity was about him when he expressed his gratitude for having attained the office, after nearly half a century of membership. It was the address of an architect who had led an honourable and prosperous career, who believed that his success was owing to a right guidance of himself, and which others could imitate. It was exactly the kind of address that a London citizen should deliver, and that fellow-citizens of the old school would heartily cheer. The applause at the close testified how well it was appreciated.

There was a sturdy confidence in Mr. I'ANSON'S way of making little of the existing depression that could not fail to invigorate a good many of those present. After fifty years of practice in the City, a man is bound to observe that there are ups and downs in life, but on the whole there is a chance for the prudent. The City, as the President told us, is not entirely rebuilt; there are suburbs apparently without limit, and in the provinces new buildings are also needed. On hearing Mr. I'ANSON, it was difficult to resist the conclusion that the young architect has better prospects now than existed in his own early days. It was shown also that our time demands buildings of a special class, which are opportunities for the competent. But the young architect was advised to be always ready for anything that might turn up, and one of the ways that was suggested to satisfy himself was by passing the examination that is necessary to gain a certificate of competency for a district surveyorship. It was useful as a test of knowledge, even if office were not sought. But a post of the kind, according to Mr. I'ANSON, was not to be despised. He has held one himself, and knowing the advantage of it he feels he ought to advise others to follow him. Sound common sense of this kind pervaded the address, and suggested a time when the wisdom of DEFOE and FRANKLIN was admired in London, and the golden rules of life were hung up in houses. So much has been said about architects becoming apostles and confessors of art, it is a relief to hear a few words that are inspired by good sense and knowledge of life.

As was to be expected, Mr. I'ANSON in what he said about education did not advocate any of the new-fangled systems for creating architects, and which are only of use to enable young folks to build castles in the air. The President insisted on pupilage as being the right introduction to architectural work, and it was noteworthy that he used the old-fashioned and more proper word apprenticeship. He did not, however, suggest that it was sufficient to allow a youth to breathe the stuffy air of an office during a certain number of years in order to make him an architect. We spoke lately about the want of courage that was exhibited by the Institute in avoiding any recommendation to architects upon the education of their pupils. In his first address Mr. I'ANSON proposes the insertion of a clause in every indenture stipulating a submission to the Institute examination by the pupil, and this will entail "due care from the master to whom he has been articled." It might also have been proposed that the names of the architects who are the masters of successful pupils should be published. It would be an acknowledgment that duty was done towards pupils, and in time a distinction would be made between careful and indifferent masters.

Mr. I'ANSON, when talking of education, announced the probability that financial support would be given to the Architectural Association, and he gave unstinted praise to the members who undertook the supervision of the classes. It was inevitable that something must be said about the Royal Academy, but Mr. I'ANSON did not suggest that architects had any claim on the Academicians. He simply expressed the hope that as the Institute helped the Association out of goodwill, without any question of bond or instrument, so the Academy might help the Institute. But the President, as a man of business, must know that such a course is impossible until the Institute imitates the Association, and does something towards education.

It is gratifying to find that by his visits to Paris, Mr. I'ANSON'S eyes were opened to what can be done by the Société Centrale des Architectes with a revenue that seems small when compared with the Institute's. How is it that in France everybody connected with the building trade is proud of recognition by the Société, while among practical men in England the Institute is supposed to be a sort of compound of a circumlocution office and dilettanti society? That is a question which the Council of the Institute would do well to resolve, especially when it is found that the whole contracting class in England is endeavouring to persuade the public that architects are no longer a necessity. Mr. I'ANSON says that the French system of recognising what is done by contractors and workmen must confer exceptional happiness on a large number of people; it does more, for it makes them and others be loyal to the cause of architects. The Institute, on the other hand, began by asking builders to give them the benefit of their experience in a tabulated form, and, having secured the information, the builders and their successors were ignored.

A different state of things may exist when federation flourishes among us. Mr. I'ANSON is the chairman of the Institute Committee, and he acknowledged that less is cared about the subject in London than in the provinces. He could not reveal the nature of the report which is in preparation, but we can judge of its nature when we know that it will relate to uniformity of practice, examinations, and interchange of "communications relating to the art, science, and profession of architecture." Members cannot be got to read the Institute Transactions; are they likely to give more attention to the papers from a provincial town?

As a City man who must believe in the value of

utilitarianism, Mr. I'Anson could not help expressing satisfaction that the Battle of Styles was over. He knows there is no accounting for tastes, and it is the business of London to provide for everybody. What was the use of Tite and Scott fighting over the shape of a window or the slope of a roof when it was impossible for one to convert the other? If people will have two styles why not accommodate them, since it is by rivalry in taste that business is promoted? The President, although a Classic, could not therefore agree that Gothic was extinct—or he hoped that it would not become so until something else took its place. Business does not admit of prejudice. Go to Brittany and Holland, if you like, but do not forget that there is something to be found in Italy and Greece that can also be turned to account.

There is a possibility that Classic may have the upper hand before long—indeed, it may be said to have it now—but Mr. I'Anson, as a Classicist, did not crow over the fallen style. It was out of fashion, that was all. If its votaries had failed, there was more to be learnt from honest failure than from immature or superficial success, for the fortunes quickest made do not last the longest. His own school had its revenge at last, but as far as he was concerned, it was one of goodwill.

An address which takes so broad a view of life is somewhat of a novelty in the Institute, and it can hardly fail to do good. We sincerely congratulate Mr. I'Anson upon his success in the President's chair, and we are glad to think that his year of office will be signalised by the reception of a dignity from the Sovereign.

TRADE AND FINANCE.*

In the present condition of affairs there are no books that are likely to have more fascination for a reader than those relating to finance. Everyone cannot help asking himself whether in the pages he may not find something that will reveal the great mystery of our time, and explain how it comes to pass that business should be as flat and unprofitable as the uses of the world seemed to Hamlet. Are we in a time of transition, as the Socialists say, and is it necessary to have a reshuffling of the cards before one can expect to make out a balance-sheet that will be gratifying? Is the cause of the stagnation to be found in Bulgaria, as some will urge, or in the enormous quantity of vacant houses, as others maintain; or is it due to some influence external to the earth which acts in systematic periodicity, as the meteorologists declare? Just now it is open to all the world to hold the most heterodox opinions on the subject, for apparently the wisest cannot reveal to us how the gold (or what serves for it) which is lying in bank cellars is to be allured from that safe but inglorious retreat. Our own opinion is that it is mainly due to a feeling of panic which is none the less real because it is persistent. It is always easy to convince the world that danger is near. If caution were listened to, there would not be a herring found on a breakfast-table, for, as Shylock says, ships are but boards, sailors but men, and there is the peril of waters, winds, and rocks. In the same way it is to be explained that in speculation there is a risk of failure, and that no branch of commerce should expect to escape foreign competition. But it can also be shown that there is another side to the question, and that courage can become as successful in business as in war. With a better knowledge of the theory of trade there would be less of the panic, and for this purpose it would be difficult to find a more serviceable work than the "Trade and Finance Annual." It has been compiled from official documents and authoritative works, and the information is brought down to the latest time. It is also distinguished by its practical character, and in this respect it differs from the financial speculations of most political economists, who treat of trade and money as if they were abstractions.

The volume rightly begins with a series of chapters on the "Money Market," in which banking, bill-broking, circulation, panics, the clearing-house, &c., are specially considered. London being the financial centre—the clearing-house of the world—it can show an infinitely bigger deposit of money than any other capital. In 1873, Mr. Bagehot estimated the loan fund or relative deposits of the banks in the great cities as follows, the numbers being millions:—London, 120; New York, 40; Paris, 13; Germany, 8; and the proportion remains the same. The figures do not represent the money in London banks which do not publish accounts, and which are greater. The City is, therefore, not only able, but does, lend more than all the others put together. The money may not be lent by the banks directly, but it is, as Mr. Bagehot says, "lent to those who lend." In these operations much depends on the Bank of England, which, according to some financiers, serves the part of a brake on enterprise. The "Annual" tells us "private and joint-stock banks never borrow directly from the Bank of England." If they want money they go to the bill-broker, "who obtains the required money from the Bank." The greater part of the business of the country is, however, conducted with the private and joint-stock banks, among which there is much variety. In the London district their constitution is affected by the Bank of England, which retains certain privileges in respect of paper money. One of the anomalies of banking is that Scotch banks are more leniently treated in that respect than others. According to the "Annual," "When an English county bank wishes to enter London, or sixty-five miles round, it is compelled to give up its note circulation; but a Scotch bank can go to London and do business there, and yet retain its note circulation."

The difference between the old and the modern systems of finance is marked by the growth in importance of the bill-broker. According to Mr. Bagehot, bill-broking in the sense of the word now accepted was unknown in London in 1810. The broker now is an embodiment of credit, and is accepted as a guarantee of the credit of others. When Cassio cries "my reputation" so often, and says that in losing reputation he lost the immortal part of himself, he was a type of a City bill-broker. He is a power according to the extent of the trust that is reposed in him, and he fulfils the double office of being the chief agent of a bank and the chief surety for advances.

It is inevitable that, as time runs on, the value of speculations will be more and more determined by the bill-broker's opinion of them, and as profits are the same to him no matter where they may arise, he will of course be disposed to look more favourably on foreign investments if they return larger sums than on those which may exist at home. Hence building as investment runs the risk of being misprized. It may be secure, but there is not that nimbleness about the operations which financiers desire. It holds, for example, no place among the numerous industries that are considered in the volume before us. Agricultural produce, dairy farming, ensilage, fruit culture, wool, coal, copper, lead, tea, and the like, all come under financial gaze, but building is passed over; iron may be said to be the only building material that holds a recognised place in what is called "Lombard Street." With a banker of the old-fashioned type the case may be otherwise. The financial world is not, however, ruled by men of his class, but by the broker, and unhappily, as we have said, he looks askance at building in general. Why this state of things should exist is a large question, which it would be difficult to treat in a reasonable compass; but one thing is certain, that what is called financial opinion cannot be ignored henceforth in productions of any kind, and if it is to be favourable in respect of a building, that building must bring in a profit on the outlay.

It is too generally supposed that finance cannot see beyond settling-day, and that a jerry-built house is an ideal type of the speculative building. This is a delusion. Finance considers profit, and naturally prefers one that endures. Besides, with jerry-building it is difficult to fix a standard. We find, for instance, a supposition in the "Annual" about one of the consequences of a partial reform of the leasehold system in towns, and it is that with a lease of nineteen years it might be possible, by using inferior materials and workmanship, to build a house that would just last that time. This suggests what is thought of the possibilities of building by an important class of judges.

We find in the "Annual" that the system of land tenure is condemned, by which so much of England is

* *Barker's Trade and Finance Annual*, 1886-1887. A Book of Reference to Matters relating to Trade and Finance. Effingham Wilson.

rendered less productive than it should be. It is shown from the Lords' report of 1870, "that of the twenty million acres of land in the country requiring drainage, only three million had been drained," and it is pertinently asked, "How can home trade flourish whilst the whole of our agricultural population is thrown into a condition verging upon ruin?" It is remarkable that to financiers the ideal solution lies in the distribution of the ownership among the mass of the people. Nor is this remarkable when we read in the "Annual" that forty years' purchase is given for land in France, and the large capitalists are outbid by the small in that country.

There is not a page in the volume that does not give an opportunity for reflection. The book is, at it were, a map of the financial world, of which London is the capital. It suggests how the desire to possess wealth is overcoming national distinctions more efficaciously than any other power has done. The financier cannot afford to be troubled by differences of race or climate. He wishes to make money and for that purpose the world serves better than a part of it. Messrs. BARKER'S "Annual" suggests how many reforms have still to be carried out before trade and finance can pursue their way unimpeded, while, as a book of reference, it stands in the front rank.

FRANCOIS RUDE, SCULPTOR.

AT Dijon a statue of François Rude, the sculptor, has been unveiled by M. Turquet, the under secretary for Fine Arts, who delivered a discourse on the occasion. In the course of it M. Turquet said it was exactly half a century since the scaffolding was removed from the Arc de Triomphe de l'Etoile in Paris, when Rude's *Departure of the Volunteers* was revealed to a crowd. Was there ever a work of sculpture more virile, exciting, and epic; a Genius of War more irresistible, or a piece of stone more eloquent? It must have been a like feeling which could produce such an expression of tranquil resolution. And the same hands which wrought the *Departure* gave us the exquisite *Neapolitan Fisherboy* and the *Mercury*. It has been said that Rude did not believe in inspiration. What he must have meant was that inspiration was insufficient to create a perfect work of art. It should be accompanied by obstinate labour, exact science, constant and profound study of nature. Every day he repeated the saying of Marcus Aurelius, "O Nature, all comes from thee, all is in thee, all returns to thee!" and from Nature he sought the secret of beauty. He also sought it in the ancient poets and historians. It was his custom to elevate his mind while at work by having something read to him out of an ancient writer. His companion was the "Maxims of Epictetus." Full of admiration for the ancients, and especially for the Greeks, he maintained that every artist should study them in their history and customs. He imposed a rigid discipline among his pupils, but he regarded as a crime any attempt to overcome their originality or shackle their fancy. His advice to them was to seek freedom, and he had too much care for his own independence to interfere with theirs. Moreover, he was aware that it is the duty of a master to aid in the unfolding of the faculties of those youths who have placed confidence in him. Rude was not only a great artist, but possessed a great heart. Of his goodness much could be said, but one circumstance will suggest his character. He was awarded the Prix de Rome, and it was thus possible for him to live for some years in that Italy of which every artist dreams, and among the masterpieces of art. But he renounced all this happiness in order that he might follow a benefactor into exile, and nearly thirty years had to elapse before he could gratify his eyes with a sight of Italy. He was disdainful of celebrity. If my works are worth anything, he used to say, they will survive; if they are not, all the puffery in the world will not save them from oblivion. In this spirit he avoided putting his name on statuary on which he laboured single-handed. If they are worth signing, he said, my name will be put on them at a later time.

In addition to what was said by M. Turquet, it may be worth reprinting some of the recollections of Rude from the "Artistes Vivants" by Théophile Silvestre.

Having known the celebrated sculptor Rude during the three or four last years of his life, it seems to me, says M. Silvestre, that I still see him and hear him speak. He was a fine old fellow of seventy-two, straight as an arrow, and with the frame of the *Farnese Hercules*. His powerful limbs seemed ready to force their way through his clothing, and his massive neck expanded with vigour while his great hairy hands hewed the marble or modelled the clay. In stature he hardly exceeded middle height, but he appeared tall, and his bearing revealed his courage.

A patriarchal beard descended to his waist, and it was of a luxuriance that attracted attention in the streets, and gave rise to a good deal of raillery among members of the Institut. They offered as an excuse for refusing him their votes that they could not receive such a bearded man amongst them, for it appears that only cleanly-shaven candidates are eligible for the Academy. The story is told that the first wife of Ingres imagined Rude to be a model when he called one day at the house of the painter. She asked him to sit down while she informed her husband. "Who is it that wants me—who comes to persecute me?" growled the painter. "It is a model of the River God," replied madame. The painter was taken aback when he saw Rude, who had thrown himself into the reclining posture suited for such a figure, and laughed at the mistake until tears ran down the famous white beard.

Black, well-defined eyebrows imparted an air of hardness and passion to a countenance that might be called gentle and paternal in expression. The forehead was depressed at the base, arched in the middle, and tapered at the sides; from the temples to the crown was bare and shining. The eyes were small but expressive. The nose was short and round, and was without character; jaws, mouth, and chin were obscured by the mass of hair; the parts of the cheeks that were visible were marked by traces of smallpox. There was something above the ordinary type of the *bourgeoisie* in this manly and fine figure. With more energy it had recalled the type of Tintoret, with more nobleness that of Titian.

His life was calm, retired, solid, and pure, although he lived in an age that was frivolous, corrupt, and sickly. His simple and upright manner seemed to be after an antique model. Rude was a Roman who smoked a pipe. But this austereness of another age limited his intelligence and closed it against much that was luminous in modern life. A man may belong to his own time without losing the memory of the great ages. Ancient heroism, the French Revolution, and the wars against all Europe moved his spirit, but his Napoleonic-democratic sentiments needed lucidity and direction.

Like all great men who spring from the people, he possessed probity, prudence, family spirit, and laborious energy. While at work he loved to hear read a translation of Homer, or of Plutarch, Livy, Ovid, or of the "Memorial from St. Helena," and interrupted the reading by exclamations of admiration for the heroes. Then he would take up his pipe and smoke.

His pleasures were of a simple kind. He talked to people in his shirt-sleeves in the street, and for twenty years the Rue d'Enfer served as his salon. He washed his hands and arms at one of the public fountains, as if he were a blacksmith who had completed his day's work. Rarely he quitted his quartier of Paris, and it was difficult to make him pay a visit of etiquette.

Rude had a high idea of his own powers, but he did not care for honours. It may be that when he slighted them he was only expressing his bitterness that he was not adequately recompensed. But, unlike some of his contemporaries, he never sought by artifices and intrigues to augment his prestige. For many years the doors of the Institut were closed against him, through the jealousy of artists. They implored him to put down his name as a candidate, and promised to support him, but failed at the right moment.

It was at Dijon on January 4, 1784, that François Rude was born. His father was a maker of German stoves. In his childhood he blew the bellows and hammered iron on the anvil. During the rare moments that could be spared from the forge he attended the classes of the art school, which at that time were directed by Devosge, the master of the illustrious Prudhon. In course of time the old stove-maker was struck down by paralysis, the business was at an end, and young Rude was obliged to take employment with a firm of house-painters.

He had tried his hand in modelling some busts; one was of Monnier the engraver, who was the father-in-law of a tax-collector named Fremiet. Under the pretext of having facilities to execute the bust, Rude was invited to stop in Fremiet's house, and there he was treated with a generous affability. When Rude drew a number for service in the army in 1806, Fremiet sacrificed a part of his modest fortune to provide a substitute, in order that Rude might be preserved to art. Artists are not always free from ingratitude, but in this case the generosity was never forgotten.

In 1807 Rude left Dijon for Paris, furnished with a sum of 200 frs. and a letter of introduction to Denon, the Director of the Museums and the art adviser of the Emperor. At that time the Vendôme Column was in preparation, and Rude was employed to model a great part of the arms and uniforms that are seen in relief on the pedestals. He did not forget his studies. In 1812 he obtained the first prize of the Ecole des Beaux-Arts, which gave him the right to a place in the school of Rome. He was, however, kept back by Denon, who confided to him the commission for four bas-reliefs that were to be placed on an obelisk for the Pont Neuf, which was to occupy the site of the equestrian statue of Henry IV.

It is not necessary in this place to follow out the entire

career of the sculptor. At a later time, when he was surrounded with pupils, he was deeply respected because he was good, just, firm, and disinterested. In order to encourage one of them, he brought him to work on the monument of Godefroy Cavaignac, and engraved the name of the pupil along with his own. He asked only 6,000 frs. for his model of the statue in silver of Louis XIII., but the Duc de Luynes insisted on his accepting 10,000 frs. When his affairs were so arranged that he was assured an income of 1,500 frs., or 60*l.* a year, he declined an offer of M. Thiers, who wished to give him 30,000 frs. in order that he might visit Italy. "I am very sensible of your generosity," he wrote, "but I am in want of nothing."

Rude arrived at the age of seventy-two without having much experience of illness; at the most it was a feeling of oppression in the chest. But something like a presentiment was evident when he said that if sufficient time were allowed him to finish his statue of *Hebe* he would go out of the world without regret. One day a letter was read to him from a friend in Burgundy. He listened to some of the lines; then he put down his pipe, and fell into a sleep from which he was not to waken.

The inspired work, *The Departure of the Volunteers of* 1792, which is in high relief on a pier of the triumphal arch in the Champs Elysées, is by itself sufficient to gain immortality for Rude. The genius of the country, with extended wings, dishevelled hair, and outstretched arms, cries "To arms!" Warriors of every age at the command are seen hurrying to the frontier. We seem to hear the soul-stirring revolutionary chant mingled with the sound of trumpets, the clash of arms, the neighing of steeds, and the rustling of banners. In the enthusiasm of departure there is a prediction of victory. The *Departure* is not depicted in historic characters but in the style of allegory. In order to avoid the poverty of modern costume, the sculptor has represented his personages as semi-nude, with helmets and arms of an antique fashion. They march to battle with the stoic energy of Leonidas, Phocion, and Philopœmen, rather than with the fury of Frenchmen. Such austere warriors are not to be moved by alarms, while their measured blows cannot fail to be mortal.

This robust group puts all the neighbouring sculpture in the shade. From the character of the execution and the glory of the subject it will always be impressive to every manly soul. It is a worthy representation of one of the noblest examples of the enthusiasm of Frenchmen.

THE INSTITUTE AND THE SOCIETY OF ARCHITECTS.

THE following is a copy of the memorial and petition to the Lords of Her Majesty's Privy Council, submitted by the Society of Architects. An almost similar document was submitted by the Federation Committee:—

Sheweth—1. That a charter of incorporation was granted to the Royal Institute of British Architects in the seventh year of His Majesty William IV., whereby certain privileges were conferred upon that body.

2. That the said Royal Institute of British Architects is now petitioning for a new charter of incorporation confirming the privileges it enjoys under the existing charter, and seeking further privileges, namely, to admit to membership of the said Royal Institute of British Architects such persons only as shall have passed a certain examination or examinations imposed by the members of the said Institute.

3. That at a conference of all existing societies and members of the architectural profession of the United Kingdom, which was publicly convened, held at the Freemasons' Tavern, Great Queen Street, on Tuesday, April 26, 1886, the following resolutions were passed:—

"That in the interests of the architectural profession and of the public alike, it is desirable that all architects in the kingdom should be united in one body, having branches in the provincial cities and towns, and a central council in London, including amongst its members representatives from the provinces."

"That a committee be formed without delay to give effect to the foregoing resolution, and to facilitate the formation of committees in the provinces."

"That it is the opinion of this meeting that instructions should be given to the committee to consider the means necessary in order to obtain an Act of Parliament making it compulsory to hold a Government diploma."

4. That a committee has been duly appointed for the purpose of carrying into effect the objects of the said Conference, and a form of declaration has been issued to about 2,500 of the members of the architectural profession throughout the kingdom, in order to obtain their respective opinions as to the desirability of applying for legislative power compelling all persons hereafter entering the architectural profession to be duly qualified by examination, as in the case of the legal and medical professions. That during the past two months such form of declaration has been signed by 1,257 members of the architectural profession in all parts of the United Kingdom in favour of the legal incorporation of architects, and the definite regulation by law of the profession as regards examinations and otherwise. That further signatures are being daily added, and from the progress made during so short a period, the above number of signatures will be largely increased.

5. That the provisions of the said proposed new charter of the Royal Institute of British Architects will only provide for the examination of persons entering the said Royal Institute of British Architects, but will not affect the whole of the architectural profession, or be a bar to unqualified persons entering the profession of architecture.

6. That the number of architects in the United Kingdom according to the census returns for 1881, was 8,063, but the number of Fellows and Associates of the said Royal Institute of British Architects is only 1,108.

7. That there are sixteen metropolitan and provincial architectural societies in the United Kingdom besides the Royal Institute of British Architects, of which next to the said Institute (and the Architectural Association—a students' society) the Society of Architects which your memorialists represent, though founded only in 1884, is the largest, numbering 290 members.

8. That no provision is made for affiliating or including these societies, or for the representation thereof, in the said proposed new charter of the Royal Institute of British Architects, nor for the registration of the very large majority of architects in practice in the United Kingdom who do not belong to any society.

9. Your memorialists are respectfully of opinion that the compulsory examination of all persons entering the architectural profession is, at the present day, of the greatest importance to the general public, and would eventually be the means of protecting them against the faulty construction and defective sanitation of buildings, drainage, and other works, and that until examination be made compulsory upon all who desire to enter the architectural profession, no benefit can be gained by the public. Your memorialists, therefore, respectfully submit that no new charter giving power to hold examinations should be granted to the said Royal Institute of British Architects, or to any other body which does not represent the whole of the architectural profession, and that an Act of Parliament on the lines suggested at the above-mentioned Conference, attended by architects from all parts of the United Kingdom, and about to be carried out by the committee appointed by the said Conference, should be obtained for the registration of all architects at present in practice in the United Kingdom, and for the institution of an examination or examinations, which all persons in future entering the profession of architecture should be compelled to pass.

10. That your memorialists are supporting the measures which are now progressing with the object of promoting a Bill in Parliament for the purpose of obtaining such an Act of Parliament, and which are being carried out at the instance of the large body of the profession, and your memorialists are respectfully of opinion that the tendency of the said proposed new charter, which only affects a small body of the architectural profession, and does not in any way secure the protection of the public as above referred to, is to clash with the comprehensive and necessary public reform in the matters aforesaid.

Your memorialists therefore pray—

That no new or additional charter of incorporation be granted to the said Royal Institute of British Architects, or that the further consideration of the proposed new charter, so far as it relates to the registration and examination of architects, be postponed.

And your memorialists will ever pray, &c.

Sealed by Order of the Council of the Society of Architects.
October 29, 1886.

(Signed) Hugh Roumieu Gough, F.R.I.B.A., President.
G. A. T. Middleton, A.R.I.B.A., Secretary.

TESSERÆ.

Lions' Heads in Decoration.

F. W. Moody.

THE head of the lion exhibits a very remarkable combination of lines. In the profile the general line of the forehead and nose is parallel with that of the lower jaw. The line from the nose to the corner of the mouth is curved like an S. This is very clearly marked in the admirable lion-hunts in the Nineveh bas-reliefs. There is hardly anything in nature that I find so difficult to model as a lion's head; it seems Proteus-like—to be now like a man, now a hound, now a monkey. The least change in the length of the nose seems entirely to alter

the character; and yet if you compared examples you would find them of every length. Even Landseer, who knew lions well, and in some respects succeeded out of doors, has modelled for the jambs of the doors of the Royal Academy galleries heads which, though intended for lions, look much more like dogs. There is hardly anything that shows so radical a difference in treatment as lions' heads. After studying them all we should be puzzled to say what constituted a lion; yet the great majority of ornamental examples from the Assyrian, Egyptian, and Greek downwards, differing as they do in almost every particular, are somehow or other unmistakably leonine. The Nelson lions, admirable as they are, are too naturalistic. The larger the work the more necessary is it that it should be generalised and severe.

Flues in Dwelling-houses.

G. F. ECKSTEIN.

Kitchen chimneys with small fireplaces should not be less than 14 by 9 inches; and if the opening of the fireplace exceed 3 feet 6 inches in width, the chimney should be 14 inches square, or 18 by 9 inches, whichever way be the most convenient in the arrangement of the building, only providing that the flue have an area of 200 square inches. But the square chimney is preferable, it being more suitable to the brush for sweeping than is 18 by 9 inches. If the opening of the fireplace exceed 6 feet in width, the chimney-shaft should be 18 by 14 inches, or of an area of about 250 square inches. If the chimney-shaft be less than 36 feet in height, the sizes should be severally 14 inches square, 18 by 14 inches, and 18 inches square, in lieu of the above dimensions. Dining-room or ground-floor, and drawing-room or first-floor chimneys in lofty houses, may be built in the usual way, 14 by 9 inches. Upper storeys, the chimneys of which are usually 10 feet or more shorter than the drawing-room floor, should have them 14 inches square. Attic chimneys should be still larger till near the top, where they should be reduced, to keep out the weather, or to receive a chimney-pot. Cottage buildings, or detached houses, which are usually low, should not have any chimney less than 14 inches square, and the upper floor 18 by 14 inches. When chimneys are exposed to the air and damp by being in an external wall, it will be a considerable advantage if the brickwork can be left 9 inches thick between the flue and external air, instead of 4½ inches as is usual. If a kitchen fireplace be required in the upper part of a house, and consequently the chimney cannot be long, it must be made up in size. I would recommend two flues of the dimensions given for low buildings, or one flue of double those given dimensions; the top to be reduced about 150 square inches, or if two flues about 150 square inches for the two.

English Tapestry.

J. C. CRACE.

The English and Flemish were the first in Europe who excelled in tapestry, and are supposed to have brought the art from the Crusades; the workmen in France, from this cause, were called Sarozins. The well-known Bayeux tapestry, representing the invasion of this country by William the Conqueror, is supposed to be the oldest existing specimen. Turner, the historian, says that our Anglo-Saxon ancestors had wall hangings, some silken, some with figures of golden birds in needlework, others woven, and some plain; and in various illuminated manuscripts, dating from the fourteenth to the sixteenth centuries, I have found the material frequently introduced as a covering for the walls, and particularly as a canopy for thrones and chairs of state. It is in the reign of Henry VIII. that I have been first able to trace the distinct manufacture of the wove tapestry; and Dugdale, in his "Warwickshire," affirms that it was *now first* introduced into England by William Sheldon, Esq., who brought over workmen from Flanders about 1540, and employed them in drawing hangings, of which I believe specimens still remain at Weston. Notwithstanding the authority of Dugdale, I think the art was merely then revived; for Lord Arundel, by his will in 1392, tempore Richard II., bequeaths to his wife Philippa the hangings of his hall *recently* made in London; and even ten years previously Richard II. granted a license to Cosmo Gentilis of six pieces of tapestry, of a green ground, powdered with roses, which the king sent as a present to the Pope. However, the art seems in the reign of Henry VIII. to have been brought to a perfection it had not before attained, and the great Holbein is supposed to have furnished various designs for it. About this time the use of tapestries was not confined to the nobility, but it was not uncommon to see abundance of arras, rich hangings of tapestry, silver vessels, &c., in the houses of persons of much meaner quality. In the reign of James I. a very extensive manufactory of hose tapestry was established at Mortlake, in Surrey, by Sir Francis Crane, which was munificently patronised by that king and his son Charles I., who granted an annuity of 2,000*l.* towards the maintenance of the undertaking. Francis Cleyn, a painter of considerable reputation in the service of the King of Denmark, recommended by Sir Henry Wotton, was employed in this manufactory, and gave designs in both history and grotesque. Indeed, the beautiful hangings which then adorned the British palaces were much admired by foreigners of distinction, who visited this country, and the manufacture was held in high repute abroad. The civil wars, however, ruined this large manufactory to which I have just alluded, and it does not appear to have been again carried on to any extent. A Monsieur Pariport, in 1720, made a spirited attempt to compete with the celebrated Gobelins at Paris, and founded a considerable manufactory at Fulham, in which he was nobly encouraged by the then Duke of Cumberland, who assisted him with a gift of 6,000*l.*, but this soon failed, and in 1759 a set of designs for tapestry, painted by Zacharelli, and executed by Paul Saunders for the Earl of Egremont, for a house he built in Piccadilly, were the last made in this country. Connected with tapestry are the silk and satin damasks and the rich figured velvets, and another material much employed in this country for hangings, and other purposes, was the stamped and painted gilt leather, on which was represented sometimes in relief divers kinds of grotesques, relieved with gold and silver, vermilion, and other colours. Many suppose it to have been invented by the Spaniards, and by them communicated to the Flemings, who excelled in it, and introduced here about the time of Henry VIII. The writers in the French Encyclopædia confess, even in 1762, that though the stamped leather of France equalled that from Flanders and Holland, yet that made in Venice and England was superior in both beauty of design and durability.

Architecture and Music.

QUATREMERE DE QUINCY.

A passage of Vitruvius, in which he recommends an architect to have some tincture of the knowledge of music, has made people suppose that music and architecture had a reciprocal system of harmony. However, if Vitruvius thought it proper that an architect should understand music, he has given his reason for it, and has pointed out to what purposes this knowledge should be applied: he says it is necessary to enable the architect to manage the repercussion of the actors' voices in the structure of a theatre; and, likewise, to judge by the sound of the degree of tension of the cords of ballistas or other war-like engines. Theories established on passages like these are as false in their principle as in their application. Nevertheless, several clever men may be quoted (the great Blondel among others), who, in treatises upon architecture, styled by them "Harmonical Treatises," have taken pains to create purely nominal analogies. For example, according to their fantastic parallels, the Attic pedestal (who could ever doubt it!) signifies the key-note, the 4th, the 6th, and the octave, thus forming a chord; and, when a plinth is added, it is considered as a 7th, and the chord is thus changed into a fundamental discord, which is still conformable to the laws of harmony. So far all is clear, but there are the two fillets that terminate the upper and lower part of the scotia; and then two mouldings are here, as elsewhere, in the way of their whimsical system. What name is to be given to them? and how do they contribute to the harmony? Blondel and Ouverard are not discouraged by this difficulty. These mouldings, they say, must be considered as fugues, which, by their modulation, serve to prepare and resolve the chords, and to connect and soften the whole into perfect harmony.

Obstruction of Light.

D. GIBBON.

Where a party brings an action for the obstruction of his light, he must prove that he has had the uninterrupted use of the light for the twenty years immediately preceding the action. The usage must have been uninterrupted, but no act or matter is deemed an interruption, unless it has been submitted to, and acquiesced in, for one year after the party interrupted has had notice thereof, and of the party making or authorising the same to be made. Thus, if windows have existed for twenty years, an occasional obstruction will not affect the prescription; but if any such obstruction has continued unabated for a year, the prescription will be wholly destroyed. In like manner, if the owner of the house has pulled down his house, and not rebuilt it with windows in the same situation within a year, or has blocked up the windows for a year, his right will be gone, though a disuse of the right for a shorter period would not, I apprehend, be deemed an abandonment thereof, so as to interrupt or destroy the prescription. A prescription for the use of light may be destroyed by an alteration of the manner in which it is enjoyed, as by altering the size or situation of the apertures through which it is received. Thus, where a party, having the right to light, carried out the wall of his house, and made a bow window in the new wall, in the same elevation as the former one, it was held that the easement was gone, since he had no right to receive the light through the new window. But it has been considered that the enlargement of an ancient window will

not of itself destroy the prescription, so as to entitle the owner of adjoining land to obstruct the passage of light into any part of the space occupied by the ancient window. And where a building which had been a malt-house was converted into a dwelling-house, Macdonald, C.B., ruled that it was entitled to so much light as was sufficient for the purpose of making malt, though not to any greater quantity. And where a party was entitled to light by means of blinds fronting a garden, and took away the blinds, and thereby opened an uninterrupted view into the garden, Lord Kenyon held that the proprietor of the garden was not justified in making an erection which diminished the light heretofore coming into the house through the blinds.

French Rolled Beams.

SIR W. FAIRBAIRN.

In the manufacture of malleable iron beams in France, sufficient attention has not been paid to form, in order to attain the section of greatest strength. The French philosophers and engineers are fully aware of the experiments made in the year 1845, for investigating the strength and form of iron beams, in order to establish the principle on which the Britannia and Conway and tubular bridges should be constructed. The formulæ deduced from these experiments are well known in France, and up to the present time have been used for similar constructions. They proved that wrought-iron beams followed a totally different law in the resistance to strain to cast-iron; that in wrought-iron beams the area of the bottom flange requires to be little more than one-half that of the top; while in cast-iron beams the area of the bottom flange should be six times that of the top flange. This difference arises from the great resistance which wrought iron offers to a tensile strain, and its comparatively inferior resistance to compression. Cast iron, on the other hand, possesses a high power of resistance to compression and defective resistance to tension. The following table of resistance will show how the material should be distributed in order to obtain the maximum of strength with the minimum or least required quantity of material:—The resisting power of—

	To tension, in tons.	To compression, in tons.
Wrought-iron plates is	23	12
Copper ,,	16	3
Cast-iron ,,	8	51

From the above it is evident that to obtain the maximum strength in a wrought-iron beam from the least quantity of material, the area of the top flange should be nearly double that of the bottom; but as this is difficult of practice, it is desirable to make the top flange as broad as possible, for the purpose of giving the beam lateral strength.

Absolute and Relative Strength of Timber.

M. COWIE.

In ascertaining the strength of timber, two points must be kept quite distinct, viz., the constant expressing the relative strength, and the constant to be used in the formulæ, such as those given in Turnbull, which we may call the constant representing the absolute strength. If a hundred experiments are made on a particular kind of fir, the breaking-weight in each case being taken under exactly similar circumstances, the 100th part of the sum of all these weights represents fairly enough the mean strength of that particular wood, *i.e.*, it will do to compare with a number determined in the same way for another kind of fir, and the greater this mean weight is, the stronger the wood. So far, then, as scientific research is concerned, this method is fair; but the same constant will not do for the practical man. I say that for this we must take the least weight that broke the beam, and not the mean; for the workman wants to know not what the average strength of the wood is, but how much he may trust to a particular specimen of it; and therefore he wants to know what is the least weight that broke a fair, uniform, sound beam under given circumstances. The first set of constants will guide him in the choice of his material, but if he begins to calculate the dimensions from the formula, as in Turnbull, he wants a different constant, viz., the one I have above pointed out. My attention was drawn to this subject by reading the following passage in Professor Barlow's book on "Strength of Materials," p. 26:—

> Since the strength of direct cohesion must necessarily be proportional to the number of fibres, or to the area of the section, it follows that the strength of any iron rod will be found by multiplying the number of square inches in its section by the corresponding tabular number as given above. This, however, gives the absolute strength, or rather the weight that would destroy the bar; and practical men assert that not more than one-fourth of this ought to be employed. I have, however, left more than three-fourths of the whole weight hanging for twenty-four or forty-eight hours without perceiving the least change in the state of the fibres, or any diminution of their ultimate strength.

It will be seen that Professor Barlow uses the expression "absolute strength" in the way in which I have proposed to use "relative strength." I say that if he proposed the smallest weight instead of the mean, the result would be one which practical men ought to trust. As to the arbitrary "one-fourth," it only shows that we have not yet succeeded in proving to practical men that we can do them any good, and Mr. Barlow justly intimates that there is a great sacrifice of the powers of the material in this very arbitrary reduction.

Timber Scaffolding.

T. GRISSELL.

In adopting the principle of timber scaffolding for buildings, in preference to poles and ropes, Messrs. Grissell & Peto, the contractors, were influenced by considerations of saving both time and expense. They had long been impressed with the want of scientific principle exhibited in the ordinary scaffolding. The system had been employed, in rather a rude form, by Mr. Tomkinson, of Liverpool, in his quarries and stone yards, for moving stones of large dimensions. Scaffolding of a somewhat similar kind was used in the erection of the Arc de Triomphe, Barrière de l'Etoile, and at the Eglise de la Madeleine, at Paris. The first time it was used by Messrs. Grissell & Peto was for the erection of the Reform Club (Pall Mall), under Mr. Barry, in 1838; then at the large graving-dock at Her Majesty's Dockyard, Woolwich, under Mr. Walker in 1832, and it was employed very extensively at the new Houses of Parliament. In these constructions its general applicability was proved, and in the erection of the Nelson Column (commenced in 1840), where it was carried up to the height of 180 feet, its stability at a considerable elevation was fully tested. Its usefulness is manifested by the facilities which it affords to the workmen particularly in buildings of stone. By its aid, and with the travelling machine at its summit, one mason or "setter" can set as much work in one day as was formerly done in three days, whilst at least six labourers are dispensed with who, with the old mode of scaffolding, were always required to be in attendance. It is also well known that scaffolding poles and cords are not only expensive but are subject to rapid decay, and after a few years' wear become useless; in fact, the scaffolding of a moderately extensive building costs a large sum when first purchased, but it is almost valueless after a comparative short period of time. Such is not the case with the timber scaffolding, which may be said to be of no greater cost to the contractor than the expense of its erection. It is not secured together by either bolts or spikes, so that the waste is trifling, and after having performed its duty as a scaffold it may be removed piecemeal into the building at the level of each floor, and be used directly for constructing the roof and the internal carpentry of the structure. The timber having been seasoned by its exposure to the weather is consequently better fitted for immediate use.

Doorways of Irish Round Towers.

G. WILKINSON.

In remarking on the features of round towers the doorway, which is common to all, first demands attention. The circular arch is by far the most prevalent, and the masonry in several of the structures is of the exact character peculiar to Norman buildings. A more conclusive argument, and one that is more evident to the general reader, is, however, the elaborated execution of the masonry in some of the doorways, displaying some of the finest examples of Norman architecture and construction, and of a character exactly similar to that of doors of later churches in the localities of those buildings, whose construction in the style of Norman architecture, I presume, is not to be disputed. It may, however, be asserted, and I believe it is considered by many, that these peculiar features of the round towers, which are in common with the architecture of the Continent, and, moreover, in common with the style of architecture in those early churches which by gradual change succeeded the round towers, are architectural features resulting from later causes, viz., the appropriation of these peculiar buildings to Christian purposes, and the insertion of doors and other features before remarked on in a style of architecture different from that originally belonging to them. It is, however, considered that such cannot be the case. For, first, the masonry around the doors shows no sign of disturbance, and reasoning is altogether against these features having been altered; and, doubtless, the masonry of these towers is as originally constructed, except in some of the tops which, from decay or otherwise, required renovation. The ground on which it is contended that the doorways are original is the universal custom of the Normans of using sandstone in their buildings, and of expending considerable labour in erecting their doorways—the chief feature in their structures. In the round towers the door-jambs are formed of sandstone, or very rarely of limestone; and always the former where there is any work on them. The later churches of the country are the same, and there is scarcely an instance in Ireland of any Norman remains in which any doorway or decorated portion is of the common limestone of the country, although for the common walls it is used, as being the material of the locality.

NOTES AND COMMENTS.

According to the statement prepared on behalf of the Society of Architects and the Federation Committee, there are 8,063 architects in the United Kingdom. It is, however, an error to suppose that so large a number are adults in independent practice. Architect is only a general term under which various kinds of assistants are comprehended in a tabulated form by the officials. If we take the census of England and Wales, it will be found that 23 of those "architects," although over five years old, have not reached the ripe age of fifteen. There are 847 "architects" who are under twenty years of age, while 1,378 are under twenty-five years. Two "architects" are described as blind, and one as dumb. Now, it is evident that the figures relate to pupils, draughtsmen, clerks, and messengers, that is, to paid and unpaid assistants, rather than to architects in the accepted sense of the word. If deductions are made for individuals of the foregoing classes, the balance representing men to whom a building would be entrusted by a client will be found to have much less numerical importance.

The competition between the sketching clubs of the metropolitan art schools is now an established institution. In the last one, which was held in the rooms of the Society of British Artists, there were representatives of the Gilbert (St. Martin's), Lambeth, Birkbeck, South Kensington, Royal Academy, St. John's Wood, and West London schools. Messrs. J. W. Waterhouse, A.R.A., Charles W. Wyllie, and Thomas Brock, A.R.A., acted as judges. The first award for figure subjects was taken by Miss Alice Woodward, of South Kensington, Mr. A. C. Weatherstone, of the same club, taking the first design. Mr. Champion Jones, of the Gilbert Club, was the winner of the first prize for landscape; Mr. Harland Fisher, of Lambeth, for animals; and Mr. C. Allen, of the same school, for sculpture. In the last-mentioned subject a second and an "extra" second prize were awarded respectively to Mr. A. S. Walker and Mr. W. Stevens, of the Academy schools; and Mr. W. Margetson, another Academy student, took the second prize for design. Mr. D. Porter, of the Birkbeck School, won the second landscape prize; and Mr. F. Mann, of the Gilbert, the second for figure composition.

An important case relating to valuation and the duties of an umpire has been decided in the Court of Appeal. Two valuers of timber on an estate in Westmoreland under a will could not agree, and Mr. Tewson, of the firm of Debenham, Tewson, Farmer & Bridgewater, was called by them as umpire. He valued it at 3,364*l*. The vendor considered the amount should have been 6,500*l*., and he applied to set the valuation aside on a legal ground which would be applicable to it if it were to be considered as an award, viz., that the umpire had not awarded upon all the matters submitted to him; that he had delegated part of his duties to an assistant, who took measurements, &c.; that he had made a mistake in the value and quantity of the timber; and that he had not been duly appointed as umpire. The Divisional Court, when the case was tried, held that there was no jurisdiction to set aside the umpire's valuation, as the umpire was not an umpire in the sense of an arbitrator, but was a mere valuer, not having been appointed to determine matters in dispute, but only in the usual way to make a valuation in case the valuers should differ who had been appointed under the conditions of sale. From that decision the vendors appealed. The decision was, however, upheld by the Court of Appeal, which consisted of the Master of the Rolls and Lords Justices Lindley and Lopes. Lord Esher said that Mr. Tewson would be an arbitrator if he had to determine a dispute on evidence, but as he came to prevent a dispute arising he was a valuer. There was to be a valuation of the timber in order to fix the price to be paid. At the time the valuers were appointed there was no dispute between the parties. It was before any dispute had arisen that the valuers were to act. And as to the so-called "umpire," if the valuers could not agree, he was to value—that is, before any dispute had arisen between the parties. The price was not then ascertained, so there was nothing for the parties to dispute about; the valuers had not agreed as to the price; perhaps they had come to the conclusion that they could not agree as to the price; their notions as to the price were not known, even if they had arrived at any; but, finding that they could not agree as to the price, they had agreed to appoint a third person to ascertain the value. It was urged that there was no contract between him and the parties, but why not? They might delegate the duty to a third person, and if so, then there would be a contract between them. The reason why he held that in this case the third person appointed was in the position of a valuer, and not of an arbitrator, was that he was merely substituted for the valuers to do what they could not do. Lord Justice Lindley adopted the same principle, for he said that a valuer in one sense may be an arbitrator, but not in the proper legal sense. The distinction is that the valuers appointed under such conditions are not to determine disputes between the parties, but to prevent disputes from arising. There was no "dispute" between the parties when the valuers were appointed. Lord Justice Lopes also concurred, saying that the umpire was merely appointed in the place of the valuers. It would follow from this that the umpire must not be made aware of the respective valuations, and is expected to make an independent one of his own.

M. Edel has prepared the designs for all the costumes that are to be worn in Verdi's forthcoming opera "Otello," with the exception of Iago's, which will depend on the choice of M. Maurel, who takes the part. It was no simple commission, since 358 designs had to be made. For the armour worn by the principal character M. Edel has followed the apocryphal pieces in the arsenal of Venice, which the cicerone asserts once belonged to the Moor. It is needless to say there was some discussion over the costume of Othello. Was he to wear the airy robes of a modern Algerian, with a few fanciful alterations, or was he to be clad as a Venetian gentleman? Neither Signor Verdi the composer, nor Signor Boïto the author of the libretto, would hear of their Othello being in any way suggestive of the malignant and turbaned Turk. He will, therefore, be in the garb of a Venetian, with the addition of a cuirass in the galley scene of the first act, with which the opera opens, and which seems to have been derived from Shakespeare's "Tempest." In the last act he will wear a sort of tunic which will allow his arms to be bare. The scenery will surpass anything previously seen in the Scala.

The Edinburgh Exhibition, like the Liverpool, has given rise to complaints about the awarding of medals, and some strange stories are related of the way in which the investigations were conducted. The exhibitor of cutlery fancies that the medal must have been awarded for the way in which the articles were arranged, for, the cases being locked, it was impossible for any judge to handle one of the specimens. The cutlery of Messrs. Joseph Rodgers & Sons (Limited), which always holds the highest position, was in consequence only awarded a bronze medal, appearance through a glass case being the only quality that was tested. There are many complaints of the same class. In all large exhibitions it is almost an impossibility to expect justice. The work of a judge is extremely onerous, and it has to be discharged gratuitously. All that can be done, therefore, in most cases is to give as equitable a decision as can be obtained from a cursory examination. What is meant by jurors' duties is suggested by a statement of Mr. Parslow, the architect, who officiated at Liverpool. He says:—"We jurymen for the most part consented to act under the impression that we should finish our work in a few days, yet the work proved so laborious that we found it needful to continue at it for eighteen or twenty days, often again and again individually or collectively re-examining an exhibit, anxious to do the best we could." And yet in spite of so great a sacrifice of time and convenience few exhibitors at Liverpool are satisfied.

MIDDLE TEMPLE HALL.

THE water-colour drawing from which this illustration is taken was exhibited this year at the Royal Academy. It belongs to Mr. CHADWYCK HEALEY, barrister. The artist is Mr. JOHN CROWTHER, of Doddington Grove, whose name is not associated with work of this class; but his drawing was recognised as among the best in the architectural room, and his style is well suited for reproduction.

THE EDINBURGH MUNICIPAL BUILDINGS.

A MEETING of the Lord Provost's Committee of the Edinburgh Town Council was held on Friday last, when the question of the New Municipal Buildings plans and the extraordinary alteration of them recently disclosed came up for discussion. According to the *Scotsman*, very general indignation was expressed at the blunder which had been made in reference to Messrs. M'Laren's premises, first in including them in the plans, and next in withdrawing them to the great inconvenience of the competing architects. The question was asked who was responsible; but, like the people in the parable, all who might have been saddled with responsibility began with one consent to make excuse. The town clerk, it is said, promptly repudiated responsibility, and held that he was only the hand of the Corporation or its committees to minute what took place, and for anything that he had done he must have had authority. An immediate call for the production of the minutes was made upon him, but this did not result in anything. A print was, however, produced by the town clerk in which it was made abundantly plain that Messrs. M'Laren's premises were included in the answers to architects who wrote about the plans; but no information could be elicited as to who was responsible for this change from the original intention to finish off at Warriston Close. Mr. Steel and others indicated that the matter could not be allowed to rest where it was, but that it would have to be fully threshed out on another occasion, and the responsibility for what had occurred put on some one's shoulders. There the matter for the present rests.

The following letter from Professor Baldwin Brown on the subject of the competition appears in the *Scotsman*:—

When an artist gets part of his picture into a "fog," it is sometimes better to take up the razor and, scraping the whole passage away, to paint it in anew. If something like this could be done in the matter of the new Municipal Buildings, it would be of no small advantage. The whole question needs, apparently, to be faced afresh with spirit and determination. Regard must, of course, be paid to those gentlemen who have been prepared to come forward and help the city with designs for the new structure, and who have been engaged for some time upon drawings made in accordance with certain conditions intimated some months ago. It now appears that these conditions have been materially changed within the last few days, and for the moment the work of the competing architects has practically been brought to a standstill. This being the case, would it not be a satisfaction to everyone if the whole question were taken up anew in a somewhat larger spirit than that in which it seems hitherto to have been treated? Those architects who have already done work, for which they should be suitably compensated, would not consider themselves badly treated if a new task were offered to them of more importance than the somewhat meagre one with which they have hitherto been entrusted.

So far as one can judge from your own remarks on the subject, and by the various letters which have appeared in your columns, the one desire on the part of the citizens at large is to have a thoroughly good building, or group of buildings, which shall be an honour to the city for centuries to come. There seems no disposition to complain of the necessary expenditure involved; and this being the feeling abroad, why should not the work be carried through on a large and generous scale? I venture to say this, because there are signs of a desire for half measures on the part of the present managers of the undertaking.

One instance is the unfortunate condition reserving to the Council the right to entrust the carrying out of plans to other hands than those of the successful designer. To say the least of it, this condition falls grievously below the dignity of the situation. It is not pleasant to hear it said that this looks like a desire to buy the brains of the foreigner, and then to deprive him of the credit and satisfaction of carrying out his own work. It is certain that the Town Council cannot have any such desire, but the "saving clause" is just an example of the half measures which one would like to see avoided.

Let the competition be either one thing or the other. If it is open, let it be open to the world; and let the successful architect, wherever he comes from, be secured in his undoubted right to superintend the carrying out of his own plans, with the assurance of local support loyally given. If the competition is restricted, let the limits of the restriction be clearly understood.

Another instance of what appears to suggest "half measures" concerns the present back wall of the Municipal Buildings. The endeavour to preserve this could only be justified if the question of cost were felt to be a very pressing one, and this is evidently not the case. Anyone possessed of common intelligence can see that the retention of this wall would greatly cripple an architect in his attempt to do justice to the magnificent site at his command. If all that the city is prepared to do is to provide an extension of office accommodation, then the wall may be preserved; but even then it would have to be extensively pulled about, and part of it at any rate must come down if any architectural effect is to be secured in the altered structure. It seems clear, however, from the present state of public feeling that much more than this is contemplated, and it admits of no question that no really satisfactory result can be arrived at unless the architect has a free hand in dealing with the site.

With regard, then, to this question of the site. In your leader of this morning you do not consider it settled, and it would be a pity if an irrevocable decision were arrived at without fullest consideration. The balance of opinion seems decidedly in favour of at any rate the neighbourhood of the present locality of the buildings. To move the buildings to the west end would be a calamity to Edinburgh. We cannot move St. Giles's or the Parliament House, which form with them, and with other civic buildings, a cluster of important public edifices in the real heart of the city, and in the midst of all its historic associations. To break up this group of buildings would be to inflict a serious blow on the most important and interesting part of the city. The particular spot to be chosen in this central locality, however, is a matter which has to be considered from many sides. From the artistic point of view the present site has, I venture to urge, not a little advantage over that recently suggested at the corner of Bank Street. The ground between the Lawnmarket, Bank Street, and the Mound is already occupied by buildings which, in the mass, are good examples of characteristic Edinburgh houses—not of the oldest date—and it would be a pity to disturb them. Again, taking the view from Princes' Street as being the one chiefly to be considered from the artistic standpoint, one may say that the architectural effect of this particular point of the ridge of the Old Town is fully provided for by the imposing Bank of Scotland, and the Free Church College, with the Assembly Hall spire in the background. On the other hand, from St. Giles's eastward to the Canongate there is little to break the masses of houses clustering on the ridge. Here a grand public building, occupying the site of the present municipal offices, would supply a needed element to the general architectural effect. Working on such a site, the architect would have more freedom than if his design had to be in relation to an already existing public building of repute, like the Bank of Scotland. In itself, as has often been pointed out, the present site is a grand one, which it would be hard to match either in this or in any other town. If more ground is needed, either for municipal offices or for a town hall—if, as may be hoped, this can be included in the scheme—is it impossible to provide it here by the same means that would have to be employed if the Bank Street site, or any other site now occupied by houses, were decided on?

May I be allowed to suggest, in conclusion, that it would be a graceful act if the Town Council should see fit to invite a small number of universally-respected citizens of high standing, acquainted through long familiarity with the needs of Edinburgh, and with the views of their fellow-townsmen, to act with the Council or with a committee of the Council in dealing with this most important subject? The matter in question is one which concerns not the Town Council alone, but the whole Edinburgh community; and not the present generation, but also generations to come, whose interests we have in charge. It is a matter on which we need publicity and the free expression of opinion, and, above all, the practical aid of leading citizens, both within and without the municipal body. Whatever may be the fate of this suggestion for forming a Municipal Buildings Committee, on which when the time came a professional assessor might, if desired, be invited to serve, I may express the hope, which I am sure all will share, that this weighty and difficult question will be dealt with in an open spirit, and with that pluck and hardihood without which great undertakings cannot succeed.

THE HOFBURG THEATRE, VIENNA.

THE exterior of the new theatre on the Ring is now finished, and the scaffolding was removed a fortnight ago. The inside will not be completed till next October, but it is already possible to form an idea what the house will be. In its mechanical appliances for scenery, warming, and lighting, and in its arrangements for the comfort of actors and spectators, the new theatre will be without its equal in the world. It will hold 2,000 persons, and every person will have a clear view of the stage, as there is not a single pillar to obstruct the view. Every private box will have its vestibule opening on to a passage 20 feet wide, and this passage opens in its turn through countless doors into a *foyer* 30 feet wide, which goes all round the building. This arrangement, repeated on every floor, will give spectators in the gallery a *foyer* as large as those on the lower tiers. Twenty-four doors from each of the *foyers* open on to wide staircases, which lead out of the theatre, so that in case of a fire alarm there cannot be any crowding or difficulty about exit. Wood has been used as little as possible in the construction, all the staircases being of stone, the girders and framework of iron, and the ornaments in the *foyers* of marble, polished stone, or enamelled tiling. All the wood used is impregnated with incombustible chemicals. The stage is completely separated from the auditorium by a wall of brick and iron, and, according to the rule now enforced in all Austrian theatres, there is an iron curtain, which can be lowered in two minutes when required.

All the mechanism for scene-lighting is of iron, and by a new system peculiar to this theatre, the whole stage and different portions of it have been made movable, so that set scenes with furniture can be prepared below the boards and sent up all ready, without any work on the stage or in the slips. The space under the stage is part of the moat of the old fortifications, and is of immense depth. Three storeys of private rooms for the actors and actresses give the space all round the stage the appearance of a large hotel. Every performer above the rank of chorus-singer will have his or her separate dressing-room, and even the "supers" will not be more than twelve in one large room. The theatre will be lighted throughout by electricity. Baron Hasenauer is the architect of the new house.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE first ordinary meeting of the Institute was held on Monday evening, Mr. Edward I'Anson, F.G.S., president, in the chair.

Mr. Fletcher Moulton, honorary associate, attending for the first time, was presented to the President; also Mr. Thomas Williams as fellow, introduced by Mr. Charles Barry, past president; Mr. Newman, fellow, and Mr. Stephen Box, associate.

The decease was announced of the following members:—Mr. Oswald Adshead, Mr. Thomas Farrer, and Mr. Harry Saxon Snell, jun.

Mr. WHITE, secretary, announced the gift by M. Charles Garnier of his work on the new opera house, Paris; also that M. Daumet, the architect of the château of Chantilly (presented by the Duc d'Aumale to the French Institut), had lately paid a visit to the Institute, and presented plans and sections of the château, and two volumes of a work on an archæological mission in Macedonia, conducted by M. Daumet and M. Heuzey.

Mr. OCTAVIUS HANSARD proposed a special vote of thanks to M. Charles Garnier, which was passed, as also votes of thanks to the several other gentlemen for their donations.

A ballot was then taken, and the following were elected:—As Fellows—Messrs. G. M. Alexander, Cape Town, Cape Colony; Philip Herapath, Auckland, New Zealand; G. E. Grayson, Liverpool; F. Usher Holme, Liverpool; John S. E. Ellis, Sydney; and Arthur Young, Queen Anne's Gate, S.W. As Associates—Messrs. William Dunn, Crouch Hill, N.; E. A. Coxhead, Eastbourne; and W. G. Smithson, Idridgehay, near Derby.

Bust of the late G. E. Street, R.A.

Mr. BLOMFIELD, in presenting a bust of the late Mr. Street on behalf of the subscribers, said the memory of Mr. Street was still green in the hearts of his friends and admirers, and no eulogy was required to claim for it a just title to the honourable distinction of being preserved in visible form within the walls of the Institute. Few among them had listened to a better or an abler address from the chair than that with which Mr. Street had opened the session five years ago. No one could have failed to recognise in it the promise of a brilliant and useful career as President which, had he been spared, would have been amply and nobly fulfilled. As to the bust itself, and its merits as a work of art, he hesitated to speak in presence of the distinguished sculptor, Mr. H. H. Armstead. That gentleman, in addition to the other well-known qualifications he possessed for the work, had enjoyed a friendship of most intimate kind with Mr. Street, without which a posthumous bust would have been almost impossible. Mr. Blomfield concluded with a regret that so long a time had elapsed since the death of Mr. Street before they could present the memorial, and with the hope that the memorial would long serve to recall the friend they had known so well, and the high aims and lofty aspirations which animated the career of that great and good man.

Mr. MACVICAR ANDERSON, hon. secretary, said that while it required no marble bust for Mr. Street's memory to live within the walls of the Institute, it would be strange indeed if they did not welcome the living likeness of one who was so diligent a student of architecture, so great a lover of their profession, and so loyal to the Institute and proud of its membership. Mr. Street was proud of his position in the Royal Academy, being one of the very few members of the profession who was entitled to write R.A. after his name. But he was still prouder of his position as President of the Royal Institute of Architects. Mr. Anderson then alluded at some length to the presidential address of Mr. Street as illustrating the principles of his professional career.

President's Address.

The PRESIDENT said:—It is my duty this evening to address you, not only on the subject of the body corporate of which we are members, but also in respect of matters which interest generally all British architects throughout the empire. I cannot, however, hope to impress you with the same weight of argument and personal quality as the majority of my predecessors. I am simply a man who for many years has sat as a member of your Council and worked to the best of his ability for the welfare of the Institute, with the hope of rising in the position of an ordinary member of Council to attain that of a vice-president, and then that of president; and, gentlemen, I thank you with all my heart for having permitted, and having assisted me, to gratify my expectations and desires.

The absorbing work of the past session lay in the preparation of a draft charter. The draft in question occupied many months of careful thought, both by your Council and by the general body of members; and, if I may express a personal opinion, the draft includes an enlargement of functions and a series of progressive developments which, if granted to us and duly carried out, will conduce to the lasting and best interests, not only of the body corporate, but also of the profession of British architects. Moreover, our petition has raised the hopes and aroused the sympathies of our brethren, not in the mother-country alone, but also in Canada, Australia, New Zealand, Cape Colony, and many other smaller though not less valued sections of the British Empire.

During the consideration of the supplemental charter a happy proposal was made by one of our senior members. It was to organise, for what the original charter calls the advancement of architecture, four departmental committees, to be appointed by the general body of members, and each to have its own honorary officers and its own departmental action. This important step, which, in my opinion, is quite in the right direction if only kept within certain limits, was considered by a special committee, whose report enabled the new standing committees to be appointed at our last annual meeting, namely, one for art, one for literature, one for practice, and one for science.

Another step, which I think is fraught with more possibilities of accident than is the former—a step towards the professional federation of architects—has been taken by a special committee, at whose meetings I have presided, and where I have had opportunities of hearing the opinions on the subject of the several societies in Glasgow, Liverpool, Manchester, Leeds, Leicester, Nottingham, and Bristol, as well as of individual members from various parts of the country. They have led me to believe that the desire for federation, or, in other words, systematic organisation, is stronger and more pronounced in the provinces than it is in London. Our next meeting takes place to-morrow, when we are to discuss as a whole a series of tentative propositions, put together from time to time, after much consideration. That there should be difficulty in settling the conditions under which such organisation can be carried out is, I think, easy to understand. But there are principles which may be established as a basis, not the least of which are the desirability of maintaining uniformity of practice, the necessity of examinations, and a constant interchange of communications relating to the art, science, and profession of architecture.

The closing meeting of the past session was one of a highly gratifying character, as much to the members generally as to myself. The presentation of the royal gold medal was witnessed by distinguished members of our body from America and France, attracted by the presence of M. Garnier, whose name has long been favourably known to us as the architect of the Paris Opera House. That, too, was the evening on which

the medals and prizes annually awarded by this Institute were distributed, and as I had previously assisted at a similar distribution of prizes in Paris, I could hardly fail to note the difference between an important annual event as it is carried out in the two countries.

In Paris the distribution is held in the handsome theatre of the Ecole des Beaux-Arts, filled by friends of the prize-holders, who testify by their applause to the interest they take as the various prizes are distributed, and an important officer of State presides. One special feature of the meeting also attracted me. Prizes were not only distributed to students in architecture, but to master-artificers and to foremen of works. Many of this latter class of men were veterans, and, in their sphere, of wide reputation; and the cordial enthusiasm with which they were greeted formed a scene of peculiar interest to an Englishman. At the close of the proceedings the Société Centrale des Architectes invited every prizeman—architect, master-artificer, and contremaître—to join the members' dinner.

Whether we could do the same thing here I will not stop to inquire, but certainly such a public and solemn distribution of honours must promote an enthusiasm which cannot but tend to incite all student-workers, both of manual and of mental capacity, to attain distinction in their career, and must, moreover, confer exceptional happiness on a large number of meritorious artisans, who at different social levels are labouring with us, and without whose intelligent co-operation the work which the architect designs cannot be properly realised.

After referring to the members who died during the year, the President continued:—

When I was a young man my feelings used to induce me to think that the only really important part of architecture was art, and that artistic power was wholly an instinct, that in fact the highest quality of an architect was to be an artist. But, depend upon it, art-power does not suffice to make an architect. The grandest effects in architecture have depended quite as much upon constructive as upon artistic knowledge. The composition of a plan, its adaptation to the purposes for which the building is intended, is rather a mental than a manual exercise, and though artistic feeling may undoubtedly enhance the effects to be obtained by thoughtful arrangement, it is study and practice and experience that combine to render an interior workable, and fit for everyday use. I am, therefore, an advocate for the systematic teaching of art, as far as it can be taught, and of all those sciences pertaining to the theory and practice of building construction. The traditional custom of apprenticing young men to a practitioner, whereby they can closely follow and assist in the work done in an architect's office is, I still think, a right system, advantageous to the apprentice if he be worth anything at all; but it is far, very far, from being enough, and the more often this is emphasised by those who occupy the position I have the honour for a time to hold, the better it will be for the profession, at least until the subject of architectural education is better understood than it is at present, or until people cease to repeat the formula that architects, like French cooks, must be born, and cannot be made. Surely the old and true saying, that the three things necessary to make a successful man in any profession are nature, study, and practice, may be safely applied to our own, and surely two out of these three items are distinctly within the area of teachable things.

Indeed, they require a great deal of teaching, and any attempt to teach, if it is to be successful, must be tested by constant examination. I feel that it is an absolute obligation on the senior members of the Institute to personally bring this matter to the notice of those in their employ, whether as assistants or pupils. I venture even to recommend the insertion of a clause in the indentures of every articled pupil, that he should engage in due course to present himself before our Board of Examiners, and pass, or at least try to pass, the examination in architecture.

Every pupil who has devoted himself in a reasonable manner to his studies, and whose professional education has received due care from the master to whom he has been articled, should be able within a year after he is out of his time to pass that examination, for in its present range it comprises merely the minimum amount of knowledge which a young professional man should early possess. But it is too much to expect that young men, who see their predecessors successful in practice without having undergone what some may call the drudgery of this educational course, will voluntarily subject themselves to such a test, at least in large numbers, and it is only by the direct personal influence of masters and employers over their pupils and clerks that the advantages derived from passing the examination can be brought home to young men.

However great, though, may be our exertions in this respect, both corporate and individual, they must be frustrated for some time to come by the lamentable deficiency, in too many cases, of early education among those who seek to enter and who do enter our profession. The fact has not escaped the attention of the Special Education Committee, and I trust that the report will enable you to see your way to devising some important measures for the furtherance of professional education in conjunction with the Committee and members of the Architectural Association.

And while preparing in all good faith to lend a hand, or at least to offer one, to a junior and distinct body, working for objects which if not identical are identified with our own, may we not hope that a higher educational institution, far older, infinitely richer than we are, and invested with extraordinary powers, which it derives direct from the sovereign, may in like manner hold out a hand to us? May we not hope that the Royal Academy will see its way not only to carry out the provisions relating to architecture as laid down at its foundation, but also to develop the educational powers with which it has been specially entrusted? I hope that no one will misinterpret my meaning, or fancy that I am in the slightest degree inimical to the Royal Academy, or that I wish it the smallest harm. On the contrary, I look back to its Antique school with gratitude, for in my time it was the only institution in England which offered any help or encouragement to art-students. At the same time I feel bound, as the President of this Institute, to offer a remark on the present incomplete representation of architecture at the Royal Academy, and an expression of regret that the careful recommendations of the Royal Commission of 1863, which were intended to improve the character of that representation, have been totally disregarded.

Before leaving the subject of the educational means provided for architectural students I should like to refer to the examination which, for the last thirty years, has been entrusted to us by statute. Although but slight artistic acquirements are necessary for those who have to fulfil the duties of district surveyor, a large amount of practical knowledge is necessary, and I hold that these appointments, some of which are of considerable value, offer opportunities for professional employment which form a valuable incident in our profession. The emoluments differ greatly in different districts, and I think that the Metropolitan Board would act wisely and to the public advantage if it promoted the most meritorious of its surveyors, as vacancies from death or resignation occur in the busier and consequently more remunerative districts—a proceeding which, in the cases respectively of Mr. Aitchison, A.R.A., and Professor T. Roger Smith, has already afforded cause for satisfaction. Anyhow I venture to recommend young men not to neglect the means of advancement secured, in more ways than one, by passing the examination for certificates of competency to act as district surveyor in London, or as building surveyor under local authorities; for although such positions offer but little scope for the attainment of artistic distinction they confer substantial advantages, both practical and pecuniary, which an exclusive devotion to art often fails to provide.

I hear a general complaint that professional employment is conspicuously lacking, but there is still a considerable amount of metropolitan building going on. The wonderful extension of the suburbs still goes on, and looking to the old part of London—that comprising the greater portion of the City—although much has been pulled down and rebuilt, there still remains a very large number of buildings which must find work to do for metropolitan architects for many years still to come. In the provinces also there are municipal and other large works commenced and contemplated, and though I have heard some of my younger brethren say that they are fighting the battle of life in our profession somewhat in the guise of an army of martyrs—and in our early years success seems long deferred—still, as a rule, it comes to those who fight for it well and honestly, and with perseverance. Indeed, I have lived to see many of my contemporaries of fifty years ago realise a full result for their early labours, and I do not doubt but that, fifty years hence, more that one juvenile martyr of the present time will, in all humility and thankfulness, admit the same.

Many changes, too, have come over the spirit of the time of which I am speaking. The strong feelings to which utterance was given after Augustus Welby Pugin published his "Parallels," and when Sir William Tite disputed with Mr., afterwards Sir Gilbert, Scott as to the shape of a window or the slope of a roof, have considerably softened; and when I remember that one of the most distinguished architects of the century once expressed to me his opinion that St. Paul's Cathedral was only fit to be converted into a railway station, I confess to some surprise, tempered with satisfaction, at seeing quite lately the details of Sir Christopher Wren's masterpiece illustrated in the Architectural Association's Sketch-book—a work fairly representative, I think, of the youthful sentiments of the day. And, though I do not agree with that Minister of the Crown who, two years ago in this room, stated his belief that, as far as public buildings were concerned, the Gothic style was extinct, yet there can be no doubt that the too literal application of Mediæval forms has recently received, from various causes, a very decided check. In what direction the present desire for freedom in the choice of models and in the application of precedents may lead, I do not attempt to predict. But I remember that this very year, through the energy and

zeal of my friend Mr. Blashill—who, in this particular, followed almost in the footsteps of the late Edmund Sharpe—some twenty English students accomplished a visit to Rome during their Easter vacation. To visit Rome and Athens was an indispensable part of an architect's education in my youth, when the Classical buildings of Sir John Soane, of Sir Robert Smirke, and afterwards of Sir Charles Barry, were objects of admiration; but at a later period the "Classic" ground of British architects seemed for many years transferred to the old province of the Ile de France, then to that of Brittany, and until recently, I am told, to Holland. But now that Italy has had another chance at the hands and pencils of our students—and I am sure that they did not find her cities wanting in those qualities of picturesque effect which they are taught very properly to admire—I have every hope that the gloom and monastic austerity, the labyrinth-like arrangements of stair and corridor, of which the people who pay for our public and municipal buildings complain as characteristic of too many recent interiors, will disappear.

That visit to Italy seems to me to be a sign of the time pregnant with meaning; and I am the more glad of it because men who go there, and who make any stay there, are sure to yearn for opportunities of studying on the spot the more refined monuments of Classical art which Athens and ancient Greece can alone afford. The recent erection of a British School of Archæology under the hill of Lycabettus may in due course supply such a want, and I cannot veil the significance of the fact that, a day or two hence, my friend, Mr. Penrose, will be on his way to Athens to take charge of the new school as its first director. Thus "The whirligig of Time brings in his revenges"—revenges not of a hostile or bitter nature, but teeming with goodwill and satisfaction.

Mr. FLETCHER MOULTON proposed a vote of thanks to the President for his charming and interesting address. He might have been selected for this pleasing duty because he possessed, in a large degree, that faculty of wonder with which the very uninstructed looked on erudite subjects; if so, the address had defeated the object, for one more simple and more calculated to go home to the hearts of educated men he could not imagine.

Mr. G. AITCHISON, A.R.A., seconded the vote of thanks. No one could doubt, he said, that a more artistic feeling pervaded nowadays the whole of architecture in this country as also in all European nations. It had been his good fortune quite lately to have seen in a town in the south of France a beautiful Romanesque cathedral. It was true it was devoid of all ornament, but the proportions were so exquisite that he did not know any among the ornate buildings of France which had given him greater pleasure, or impressed him more with the evidence of the extraordinary skill of those architects who had left them such examples of their powers in producing elegance with perfect plainness and simplicity.

The vote of thanks was carried by acclamation and duly acknowledged by the President.

Mr. CHARLES BARRY said he had been asked to request them to perform the very pleasing duty of expressing their thanks for the result of the artistic labours of Mr. Armstead in the bust of Mr. Street which had been presented to them. They were not unaccustomed to feel under deep obligations to painters and sculptors who had helped to embellish their rooms, and Mr. Armstead by his beautiful bust of their lost friend had enabled them to transmit the memory of a great and good man to those who were to come after them, and to add to the list of worthies who had gained a noble place in their art, and who deserved to be remembered for many a long day. Mr. Armstead had responded to the somewhat limited means of "us poor architects" by giving them a grand work of art at, he understood, very much less than they had the right to expect. Therefore they ought not, as all would agree, to separate without giving Mr. Armstead their most cordial thanks.

When the applause which rang through the room had ceased, Mr. BARRY said, after this, he was sure it needed no seconder to the proposal, and he formally tendered the thanks of the Institute to Mr. Armstead.

Mr. ARMSTEAD, in replying, begged to thank them for allowing him to make a bust of one of their distinguished Presidents. The work had been a labour of love.

Mr. G. AITCHISON, A.R.A., said that in returning from the South of France he had seen M. Paul Sédille in Paris, by whose courtesy he had been enabled to see the remains of the Palace of Darius at Susa—the remains which were just being made ready at the Louvre for the inspection of the President of the Republic. He had to wait, of course, till the President's visit was over, when he was admitted before any of the public to view the remains. Mr. Aitchison described the remains as walls or portions of walls in brickwork, enamelled, with figures in bas-relief, the ground being partly of pale turquoise green and partly of crenellated work. Among the figures he described some soldiers, who were represented with upright spears, strung-bows, and quivers on an ornamental frieze.

LIVERPOOL ARCHITECTURAL SOCIETY.

A MEETING of the Liverpool Architectural Society was held on Tuesday. Mr. Grayson, the president, occupied the chair. An address on the subject of the Mersey Tunnel was delivered by Mr. F. Fox, C.E. He alluded to the efforts made twenty-one years ago by his late father, Sir Charles Fox, and himself to secure underground communication between Liverpool and Birkenhead. He briefly sketched the history of the undertaking which had resulted in the present tunnel, and referred to the difficulties which the promoters had to encounter in the construction of the tunnel. All the details in connection with the work were minutely described, and the address was listened to throughout with lively interest. Incidentally Mr. Fox referred to a rumour which was prevalent in the town that the amount of water in the tunnel was increasing. He said the probability was that the people who had got that notion were somewhat alarmed by the fact that an additional pump was being put down in Liverpool. There was not the slightest cause, however, to be alarmed, for the pump was being erected merely that they might have more than ample pumping power to provide for all emergencies.

At the conclusion of Mr. Fox's address, which was illustrated by several diagrams, a short discussion ensued, after which a hearty vote of thanks was accorded to Mr. Fox for the valuable information he had conveyed to the members.

MANCHESTER ARCHITECTURAL ASSOCIATION.

THE inaugural meeting of the session of the Manchester Architectural Association was held on Tuesday evening in the Diocesan Chambers, South King Street.

Mr. Lawrence Booth, the president, in his opening address, said it was greatly to be desired that more of the older architects of the city should recognise what he conceived to be their simple duty by giving an active and personal support to the efforts of the Association at improvement. There were, he was happy to say, some indications of the approach of brighter days in that respect. It was by no means certain, however, that the Association would in the long run be much the worse for having had to depend in a great measure on their own exertions. The Royal Institute of British Architects, as the recognised head of the profession, was at last bestirring itself and seeking further powers of usefulness. By prescribing a curriculum of study and establishing examinations for admission to its ranks it was safeguarding its own portals at all events against the whole tribe of the incompetent; and propositions of an even more drastic nature had been made by a committee in London to place the practice of architecture on the same level with that of the so-called learned professions, and thus make it substantially a close corporation. The proposal appeared to many of those most entitled to express an opinion as somewhat premature and too ambitious to be capable of immediate realisation, but "the handwriting was on the wall," and the younger members of the profession especially should be careful to equip themselves at all points. The public were becoming alive to the fact—which was a fact—that the life and health of the community were as much in the hands of the architect as in those of the doctor, and they would not be long before they arrived at the conclusion that by increasing the efficiency of the one they would diminish the numbers of the other, and would be prepared to give instructions to their representatives to restrain all incompetent practice of a profession involving such a vital question as that of sanitary science. "Artistic" monstrosities they had endured, and would probably be prepared to go on enduring even to the extent of professing to like them; but when they fully appreciated the question as being one of life and death for them it might be certain that the day of reformation was close at hand. It was to that branch of their profession he desired to direct attention. In ancient days great monumental and other buildings were erected by powerful potentates, who almost boasted as one of the glories of their achievements that so many hundreds or thousands of human lives had been sacrificed in the effort. It should be the boast of those present that in what they had been privileged to accomplish they had been the means of preserving the life and health and increasing the happiness and well-being of their fellow-creatures. Nothing of importance had happened in the immediate locality during the past year to furnish matter for professional comment except the confusion—not to designate it by a stronger term—of the public conscience on the subject of the Victoria Hotel, and the circumstances attending the initiatory proceedings of the promoters of the Jubilee Exhibition. In regard to the first question a committee of the Corporation had been appointed to investigate and report upon it, and they must await that report with the hope that the result would not injuriously affect their profession in public estimation and confidence. The other

subject was one which could not be so easily dismissed, because he was constrained to declare in his representative capacity that in a matter so essentially public the action of the early promoters of the Exhibition scheme, in limiting their selection of an appropriate design to what could be produced by four firms of architects out of nearly 200 practising in Manchester alone, caused a feeling of surprise almost amounting to consternation in the public mind, and induced feelings of profound dissatisfaction and disappointment almost equivalent in their effect to a determined hostile attitude towards the project in its entirety on the part of numerous members of their profession. The soothing effect of time and the loyal character of his professional brethren would perhaps allow the other side of the picture to be presented from the point of view adopted by an uninspired observer. The pioneers of the Exhibition, standing on the threshold of a great undertaking, and with little time to spare, would naturally "be troubled about many things," and would seek to avoid the incursion of a whole army of architects all armed with the ability to advise them and carry out whatever they might or might not consider desirable. And whether the extemporised committee were discreet or otherwise in the character of their somewhat hasty selection, their wisdom in seeking to limit perplexity by diminution of numbers would probably have the approval of the business men of Manchester. The selection of competitors having been made, there is nothing but approval to be expressed of the manner in which the ultimate decision was arrived at. A competent professional adviser was called in to advise both as to the terms of the competition and the merits of the designs submitted, and his recommendation was frankly and unanimously accepted by the promoters. It appeared to him that the duty of the Association now was to join in the hope that their professional brethren who were severally engaged in the arduous task of preparing the new building and its appurtenances, might so utilise their opportunity as to enhance the character of their previously well-earned reputation, and that they should all combine in the determination to put the stamp of architectural progress on their several exhibits, and thus incidentally aid in the grand illustration which the promoters have invited.

A discussion ensued upon points raised in the address, in which Messrs. Hodgson, Mould (secretary), Mee, Ingham, Woodhouse, Ward, Chadwick, and Barker took part, after which the President replied. The customary votes of thanks were passed.

THE BERLIN EXHIBITION.

THE International Fine Arts Exhibition that was opened last May in Berlin was ceremoniously closed on Sunday with music, speech-making and banqueting in presence of the Ministers of Public Worship and Public Works, the Chief Burgomaster, and other high functionaries, and a great multitude of visitors. Professor Becker, President of the Senate of the Academy of Arts, delivered an address on the historical character of the Exhibition, which during a period of 162 days had, he said, been visited by no fewer than 1,200,000 persons. Though a venturesome enterprise, it had therefore been a very successful one. The income in entrance money alone had amounted to 660,000 marks, and this, after covering all expenses, would leave a considerable surplus for the benefit of needy artists and their families. The price of the works of art sold had amounted to a million marks, and of this sum 260,000 marks resulted from purchases by the State and the Emperor personally.

At the banquet, which was held in the huge restaurant hall of the Exhibition, Sir Frederick Leighton, who had been specially invited for the occasion, made an excellent speech in reply to the toast of his health, and in the name of the English nation wished all success to German art. Sir Frederick's remarks, delivered in fluent German, were received with enthusiastic applause.

THE AMPHITHEATRE OF LUTETIA.

AT the last meeting of the Académie des Inscriptions et Belles Lettres, M. Charles Robert gave some account of the remains of the old amphitheatre at Lutetia, within the last three years dug up and examined in Paris. A committee had been appointed to superintend the excavations. These had been carried out, under the direction of M. Ruprich Robert, the General Inspector of Historical Monuments, by M. Maurice du Seigneur, architect, one of the secretaries of the committee, who had classified the different objects and placed them under a temporary covering. They consist of fragments of sculpture, cornices, capitals, fluted columns, fragments of inscriptions and statues, Gallo-Roman pottery, fragments of amphoræ, fibulæ of bronze, bone and ivory, needles, and lastly, numerous Roman coins. A meeting of the committee was held on the spot where the relics had been dug up, and the progress made in examining and classifying them was reported.

It appears that the amphitheatre of Lutetia belongs to an earlier period than the baths near the Hôtel de Cluny. M. Robert proposes that the relics shall be collected in a permanent building as national monuments of special interest to Frenchmen, and that handbooks like those to be had at the galleries of the British Museum shall be prepared and sold at a low price, giving an account of the remains and explaining the nature of the circus games and interludes performed in the amphitheatre, and of the great assemblies sometimes held in the vast space usually reserved for the performances.

BIRMINGHAM ARCHITECTURAL ASSOCIATION.

THE opening meeting and conversazione of the present session took place at Queen's College, Paradise Street, on Tuesday night. Mr. F. B. Osborn (president) occupied the chair; and amongst those present were the Mayor (Alderman Martineau), Messrs. J. Everard (president of the Leicester Architectural Association), J. Jackson (secretary, Leicester), T. Camm, H. R. Smith, A. Churchill, J. A. Cossins, Victor Scruton (secretary), &c. There was a large attendance. Letters of apology for non-attendance were received from the Royal Institute of British Architects, the Architectural Association, London, and from the Liverpool, Nottingham, Manchester, Edinburgh, Leeds, York, and Northern Architectural Associations.

The President, in his address, congratulated the Association on the work of the past, and said he looked forward to the future with very great confidence. The Association was making steady and useful progress. It was twelve years since the Association was formed, and there were sixty-three members. It was quite clear that in the future it would be necessary for architects to pass an examination, and obtain a diploma before they would be considered qualified by the public. The finances were now in a fairly satisfactory state, and owing to the economy exercised the Association would have, when all the arrears were settled, a small balance in hand. One of the most important matters of the year was the proposed new charter of the Royal Institute of British Architects, which would inaugurate a new era in their profession. They had had two important competitions in the town during the last year—the Assize Courts and the Workhouse Infirmary. Much as they wished that the competition could have been confined to Birmingham architects, yet they had in the Assize Courts a subject for congratulation, namely, the employment of a professional referee, and the perfect fairness with which the competition was conducted. With regard to the competition for the Infirmary, he regretted that, although representations were made as to the importance of appointing a professional referee, the guardians ignored the suggestion. Only five sets of plans were submitted, whereas, if a referee had been appointed, he thought as many designs would have been submitted as for the Assize Courts. On the motion of Mr. J. A. Cossins, a vote of thanks was accorded to the President. A promenade concert followed.

Correspondence

Federation.

SIR,—As there appear to be a large number of architects anxious to have the profession closed to all but licensed practitioners, I should like to ask what they exactly mean. Do they wish to prohibit the use of the name of architect, or do they wish to prohibit the exercise of the functions of an architect by all but the duly qualified? The latter would require an Act making it penal for any one to erect any building whatever without the supervision of an architect, and would be somewhat in the nature of the Medical Acts. This is surely too grotesquely impossible to be thought of, and the restriction of the name seems a very little matter indeed to make such a fuss about. Indeed, the effect would probably be to withdraw entirely from architects a large class of business.—I am, Sir, faithfully yours,

RALPH NEVILL.

November 3.

Glasgow Barony Church Competition.

SIR,—The esteem and respect in which Mr. Honeyman is so deservedly held, as well as the good cause he is fighting for—justice in architectural competitions—act as strong deterrents from controversy with him; but these reasons do not in any way protect Mr. William F. McGibbon, whose letter

appears in your issue of the 29th ult. This gentleman professes to be in a fix as to whether his number in order of merit is 1 or 3 (the decision of the assessor as published puts it at least double the latter number); but one point I desire to make clear to him, by emphatically contradicting his statement that "Mr. Honeyman and I were the only competitors who complied with these conditions." I affirm, as one of the competitors on the short leet, that my design was in every respect in accordance with the conditions, not in the opinion of "several eminent architects" who have cursorily looked at the plans, but in the opinion of those best qualified to judge, viz., myself and measurers acting with full information of my intentions, aided by actual prices for similar work I am at present executing. Mr. Honeyman, whose opinion is of value, has said to me (in another case) that he does not attach much importance to the estimate of a measurer unaided by the architect's instructions; how much less shall we think of the estimate of those who have merely seen the designs on exhibition? On the question of the accepted designs I do not intend to touch—Messrs. Burnet can fight that for themselves—beyond wondering why they sent at all a design which on their own statement would cost 15,600*l.*; but I desire to express my opinion that the Barony Church Committee have acted most fairly and honourably with the competitors. They have accepted the assessor's decision, which they were not bound under their conditions to do, and which unfortunately is not always done; and if we have a grievance it is against Mr. Pearson, R.A., the assessor. At the same time, I do not see why they should not give the competitors access to Mr. Pearson's report, which I have also asked to see. The reason given is that the criticisms, being meant for the committee only, are more free than flattering on many of the designs; but I for one should welcome such criticisms from an acknowledged master of Gothic architecture. The report would hardly have such public interest as to warrant occupying your columns, but I hope the committee will yet see their way to placing it in the hands of the competitors.

I am, &c.,

JOHN B. WILSON.

112 Bath Street, Glasgow: Nov. 2, 1886.

CHURCH BUILDING AND RESTORATION.

Worcester.—The new church of St. Paul has been opened. The materials used in the building are local red and black bricks, with Bath stone dressings. The work has been carried out by Mr. Inwood, contractor, Malvern, from the designs of Mr. A. E. Street, M.A., London.

Kilmarnock.—St. Marnock's Church has been reopened after undergoing extensive repairs. St. Andrew's free church has also been reopened after alterations to provide additional accommodation. The works have been carried out in each case from the designs of Mr. R. S. Ingram, architect.

Clydebank.—The memorial-stone of a new Wesleyan church has been laid. Mr. W. F. McGibbon, of West George Street, Glasgow, is the architect.

Eastdown, Devon.—The parish church of Eastdown, near Barnstaple, has been reopened after restoration. Mr. Wm. White, F.S.A., London, was the architect, and Mr. Dart, of Crediton, the builder.

Heigham.—The foundation-stone of a church for the district of St. Thomas, South Heigham, has been laid. Mr. Ewan Christian, of Whitehall Place, S.W., is the architect, and Mr. T. E. Hawes, of Norwich, the contractor.

Stone.—The memorial-stone of the new chancel for St. Michael's Church has been laid. Messrs. R. Scrivener & Sons, of Hanley, are the architects for the restoration, and Mr. N. Barlow, of Stoke-on-Trent, is the contractor.

Glasgow.—The Govanhill public school, which has been erected from the designs of Messrs. H. & D. Barclay, of Glasgow, has been formally opened. Mr. Samuel Preston was clerk of works.

Newcastle-under-Lyme.—The Catholic church has been reopened after renovation and repairs. The work has been done by Mr. J. Gallimore, builder, from the plans of Messrs. Dempster & Heaton, architects, of Birmingham.

Mr. J. Cobeldick, member of the Lambeth Board of Guardians, publishes an appeal for subscriptions to enable the artist, Mr. Nathan C. Hughes, to end his days outside a workhouse. It will be remembered that Mr. Hughes has, through illness and misfortune, been an inmate of Lambeth Workhouse for some time. Mr. G. Howlett, the chairman of the Board, will receive subscriptions, which may also be sent to the master of the Lambeth Workhouse; or to Messrs. Herries & Co, 16 St. James's Street.

GENERAL.

The Art Treasures Exhibition at Folkestone was closed on Saturday night. During the five months it has been open to the public the visitors amounted to 242,519.

The Fine Art Gallery Committee of the Leeds Corporation held a meeting last Friday afternoon, but no definite decision was come to in respect to the designs sent in for the gallery, and no further action will be taken in the matter until the re-election of the committee on November 9.

Mr. Morton Edwards, the Californian sculptor, has modelled several figures on a colossal scale for the Flood Building, San Francisco, which are to be cast in bronze. Mr. Augustus Laver is the architect of the building.

An Anonymous Donor has promised 1,000*l.* towards a school of art which it is proposed to erect at Poole to mark the Queen's jubilee commemoration.

Mr. William Hepper has been elected president of the York Architectural Association. It is intended to hold weekly meetings during the winter session.

A Club is proposed to be formed in Aberdeen on the lines of the old Spalding Club, having for its object the printing of works illustrative of the history and archæology of the North-Eastern counties of Scotland.

The Leamington School of Art has been closed by reason of a lack of public interest in the institution.

A Bust of Sir Alexander Grant, executed by Mr. Charles M'Bride, is to be placed in the Senate Room of the Edinburgh University, to perpetuate the memory of the late Principal.

The Belgian Chamber of Representatives, which was destroyed by fire, has now been rebuilt on improved lines.

Lady Edwards has contributed 750*l.* to the Bradford Infirmary for furnishing and endowing a children's cot.

Mr. Arthur Loader, architect, headed the poll for the Pier Ward with 350 votes at the Brighton municipal elections.

A Committee has been appointed to raise funds for a new parish church, which it has been decided to build at Hove.

The Glasgow Barony Parochial Board have approved of a committee recommendation that plans should be prepared for a pavilion hospital to accommodate 300 patients at Barnhill.

The Guildhall School of Music will be opened by the Lord Mayor on December 9.

Designs by Mr. S. Denman, of Brighton, under the motto "Simplicity," have been awarded the first place in competition for the proposed alterations at Lewes Town Hall; and designs by Mr. M. J. Lansdell, of London, were awarded the second prize.

Mr. T. R. Richards has been appointed assessor in the competition for the Slough Public Hall and Leopold Institute.

The Dean of Winchester will this month give a course of four lectures on the "Early History of England and Winchester," ranging from Cerdic to the eve of the Conquest, and the profits will be devoted to completion of the stonework of the great screen in the cathedral.

St. Paul's Church, Colwyn Bay, was totally destroyed by fire last Sunday morning.

The Wolverhampton Board of Guardians have approved of plans by Mr. Veal, architect, for alterations to the vagrant and receiving wards.

Mr. R. J. Thomas has been appointed county surveyor of Carnarvonshire, in place of the late Mr. J. Thomas, his father.

The Salary of Mr. Davis, borough surveyor, of Stratford-on-Avon, has been raised from 220*l.* to 280*l.* per annum. Since Mr. Davis's appointment three or four years ago, the work has much increased.

A Stained-glass Window is to be placed in the parish church at Newbury in commemoration of Her Majesty's jubilee. The position of the memorial will be next to that raised to the late Bishop Wilberforce. The cost of the window will be about 200*l.*

The Candidates for the post of Surveyor of Dilapidations for the Diocese of Manchester numbered thirty. Mr. T. H. Myres, of Preston, and Mr. A. W. R. Simpson were selected out of this number, with Mr. R. K. Freeman, who was, as mentioned last week, ultimately appointed.

The Ecclesiastical Commissioners announce that they are willing to sell that part of the Highgate Woods known as Churchyard Bottom Wood, for 25,000*l.*, and to accept the purchase in one hundred half-yearly payments, with interest at the rate of 3*l.* 12*s.* 6*d.* per cent. A Bill is to be introduced by the Hornsey Local Board to carry out the arrangement.

The Architect.

THE WEEK.

It was to be expected that Mr. H. Roumieu Gough should treat of the questions of federation and registration in the presidential address which he delivered to the Society of Architects on Tuesday. Mr. Gough was rather friendly towards the Institute, and was willing that it should take the lead in dealing with the questions. But if it is advantageous to admit architects within the pale of respectability in such a free and easy mode, why should a bar in the shape of an examination be set up to impede architects who happen to be a few years later in the world? We cannot see how the registration would serve architects who are living, and as to the public they are well able to take care of themselves. Apart from federation, the Society of Architects merits more support than it appears to receive. The President acknowledges that the increase in numbers does not correspond with his expectations. We are not assured about the advantages which an architect gains by belonging to a society; but if the Institute can exist in London, there ought to be room for a society in which it is not necessary for the majority of the members to be extinguished to gratify a few.

A statue of J. B. Dumas, the French chemist, is to be erected at Alais. A competition was opened, and nineteen models were submitted. On Saturday the jury examined them. The first prize goes to M. Gabriel Pech, one of the pupils of MM. Mercié and Falguière. He has been already commissioned for memorials. M. Gandès, who is apparently a new man, won the second prize. Visitors to the Ecole des Beaux-Arts, where the models were on view, could hardly fail to be struck by the number of placards on the quay front of the school. The disfigurement of public buildings by advertisements seems to have no limits. Coloured bills are stuck with impunity on palaces like the Louvre, on the pedestals of statues, and on every public building. A London vestry would prosecute such advertisers without mercy. In Paris defacement is allowed, probably because every placard acquires dignity from having a stamp upon it.

The annual report of the Manchester Architectural Association states that during the last session there were elections of fifteen ordinary and three honorary members, bringing up the total membership to forty-three ordinary and ten honorary. The average attendance at the meetings has much improved, but the committee greatly regret the want of interest on the part of the junior members in the classes of construction and design. No answers were received in the class of construction, and only one member sent in sufficient drawings to entitle him to compete in the class of design. At the visits there was an average attendance of nine members. The library has been much more used during the past session than previously, although it has been added to very slowly of late years. During the past session the registrar of the Association has been able to obtain engagements, temporary and otherwise, for thirteen members. The year's income was 49*l.* 12*s.* 6*d.*

The practice of traders seeking custom under the guise of a society or an institution with a sounding name has extended to America. The *Art Amateur*, of New York, in its last number, has the following remarks on the subject:—"The recent fashion of New York picture-dealers advertising themselves 'art associations' and 'art societies,' and their shops 'art galleries,' makes such old-established concerns as Avery's, Schaus's, Knoedler's, and Reichardt's the more reputable under their straightforward business names. The new practice is certainly misleading to the general public, and especially to strangers in the city, who, for instance, confound the American Art Association with the Society of American Artists (a purely artistic organisation), and mentally connect every picture exhibition held at 'the American Art Galleries' with the enterprising proprietors of those really splendid rooms. The commercial advantage of such a proceeding as here indicated is so obvious that small fry auctioneer dealers will not be slow to follow it. Already we read of 'the Bucken Art Gallery'—the new name for the Broadway picture auction rooms which used to be 'Leavitt's'—and there is no reason why, by-and-by, the proprietor should not get himself and his partners—if he has any—'incorporated' by the State legislature and receive pictures from Europe free of duty." When they receive invitations to send pictures to one of those American societies, painters will do well to remember that they are simply asked to aid a dealer, who finds it more convenient to assume a title of the kind than to appear under his own name.

There will be satisfaction in Westminster drawing-offices at the following resolution of the Metropolitan Board of Works:—"That the engineer is authorised, when copies of plans or drawings of an ordinary or simple character are required, or when drawings have to be enlarged, or cartoons have to be prepared, to cause such work to be done out of the office by some firm." Work of the kind can be executed at a much cheaper rate outside Spring Gardens. But there is a slight cast on the offices when it is implied that they are only competent to produce works of a simple class. It will not, however, be advantageous if the work is handed over to "some firm" of stationers to be carried out in a mechanical style by law writers. The danger arising from that course is not trivial, and the Metropolitan Board should oppose what is becoming a dangerous custom. It is well known that, for the sake of a little saving, plans of estates for conveyances are now prepared by incompetent men of the law-writing class, and hereafter many an action will arise from such records. The Board's work should be entrusted to competent firms, who have draughtsmen in their employment.

There is an end to the imbroglio between the Paris Municipality and the ecclesiastical authorities of the City on the subject of the disused church of the Assumption in the Rue St. Honoré. We have already explained that it was proposed to convert the church (which was designed by Errard) into a hall for meetings, but when the case was brought before the judges it was decided that as long as the Concordat was respected the building could not be laicized. The Municipality being unable to accept defeat with contentment, the struggle was not abandoned. It is now arranged that the church will continue to be recognised as a sacred edifice, but the adjoining buildings, in which monks teach the children of the neighbourhood, are to be made over to the City. When it is remembered that the premises are enclosed within railings, that they cannot be separated, and moreover that the school buildings are out of repair, we cannot see that the Municipality has gained much by the transaction. At the same time it is a pity that the church should be allowed to remain without a congregation, for it is a good specimen of seventeenth century work.

Mr. George Devey, who died at his residence in Hastings on Thursday in last week, was a man of retiring habits, and, in consequence, was little known except to a few of his fellow-workers; but all with whom he came in contact can testify to his extremely sensitive nature and natural artistic feeling. As an architect he had a large and representative *clientèle*, and his works bear witness to his exceptional capabilities. He was a most competent draughtsman, and his sketches were admirable. Mr. Devey was one of the first revivalists of the modern mode of Domestic architecture, and his work will still repay careful study by the younger members of the profession.

Mural paintings to which much interest is attached have been discovered in the church of Nieuport. The figures are about one-third the size of life. A part of the decoration is a Flemish translation of the Credo, and the work appears to have been executed some time in the fifteenth century. The church is ancient, and part of it is supposed to date from 1163. It has been subjected to many transformations; but, as the central part was generally respected, the Belgian archæologists anticipate that more examples of native painting are veiled under the numerous coats of distemper.

RICHARD WAGNER.*

IT is not necessary, we hope, to offer any apology for printing a review of a biography of RICHARD WAGNER in a journal like *The Architect*. If the composer could be said to have a speciality, it was in the resemblance between his work and that of most architects. WAGNER, like them, was a man who tried to unite the present with the past. Music is of all arts the one that is alike independent of past or of future. When we hear a piece by a great master, or even a simple song, we always suppose it to have been the product of the author's inspiration; we never care to inquire if any part of it is derived from tradition, and it is fatal to the work when we are able to detect a resemblance between it and something that is more ancient. The old humorist who said that music was "like an hostess that hath no arithmetic but her brain to set down her reckoning," had this idea of the independence of the art. It does not require book-learning, and is as indifferent to the almanack as to arithmetic.

WAGNER could not help the inevitable. His music had to be modern and Wagnerian, but he tried to bring it into relation with the dim past by means of the subjects he selected, and the archæological accuracy of costume and surroundings. The *mise en scène* of the Bayreuth would be an impossibility in any other theatre, for nowhere else could a manager be found with so much reverence for that ever-enduring Time which we call fleeting because we are so ourselves. WAGNER endeavoured to atone for the shortcomings of his own art by calling others to his aid. If Fate had made him an architect, he must have been the most rigorous stickler for accuracy in the imitation of periods and styles.

But in the same way as architects try to accommodate existing wants when they are thinking of antiquity, WAGNER was a man of our time. With all his enthusiasm for the past he never allowed himself to be fettered by it. He swayed it like a king. The odd position that he holds in France is due to WAGNER's unique combination in himself of what is old and young. The majority of Frenchmen do not pine for a return of antique times, and if the past were wiped out, with its cut-and-dried formulas, they would not grieve. Artists and authors believe that this century of ours should be sufficient to give inspiration, and there is no need to rake among the ashes of a bygone world in order to gain a spark of fire. In spite of all the drawbacks that come from his German origin, WAGNER is appreciated by Frenchmen of that class. From national feeling (which they admit to be a form of weakness) they may keep his operas from representation on the Paris stage, but they will agree with the musician in "L'Œuvre," that in his works we may hear the "Alleluia sublime du nouveau siècle," and his compositions are like a colossal arch, uniting all the arts in one.

A quarter of a century ago, when the great fight over Wagnerism was raging in Paris, we find so advanced a writer as BAUDELAIRE also recognising the comprehensiveness of the composer, by which his dramatic art became the "coincidence of several arts," and the most synthetic of all. According to the critic, while WAGNER approached antiquity by the passionate energy of his spirit, he is actually the truest representative of the modern manner. This dual character may enhance WAGNER's reputation as time goes on.

It is only just that a book on the composer should be also suggestive of the modern spirit. That spirit is not simple in its manifestations or marked by unity. It can be reverential on occasions, but it is not afraid to mock the persons or things which to many are worthy of reverence. WAGNER was made to know all its varieties. He had his worshippers and his caricaturists; he was at the same time regarded as a charlatan and a demigod. In the splendid volume by M. JULLIEN, which appeared this week in Paris, we have before us a record of the diversities of thought and feeling to which WAGNER gave rise. M. JULLIEN, as a Frenchman, knows that thought is, or should be, free, and that a great man may be serving some most useful purpose when he is turned to account by wits and satirists. He does not, therefore, write a defence of WAGNER. That he considers is unnecessary. What he wishes to give is a history of the valiant struggle of a man of genius to express his ideas and to explain the difficulties which had to be overcome. A caricature in a humble periodical may suggest what was before WAGNER more clearly and concisely than a pamphlet. That form of representation has become as M. JULLIEN says, an historic document and a gauge of celebrity. WAGNER knew its value, and, however he might be irritated, he never set himself against it. In this book we have English, French, and German caricatures side by side with copies of the works by which painters expressed their reverence for the master.

The *bourgeoisie* having supplied nearly all the great men of France, a French writer must feel satisfaction when he is able to record that RICHARD WAGNER sprung from the lower ranks of that class—the *petite bourgeoisie* of Leipsic. His grandfather was a Custom House clerk, and his father belonged to the police. WAGNER was reared in poverty. He once said that he grew up without other guides than life, art, and himself. He was not a tractable student even when he was placed under a teacher of music. The sight of WEBER appears to have been the first influence over his latent power, and he contemplated the author of "Der Freischütz" with "a religious terror." But beyond the impression that was made on him by his works, WAGNER was not indebted to WEBER. As he was able to rhyme WAGNER fancied he was born to be a poet, and to gratify himself he attempted tragedies on the model of "Hamlet" and "King Lear." He was prodigal of life in them, and in one scene he contrived to get rid of over forty of the characters. Happening to hear a symphony of BEETHOVEN, he was so overcome that he fell ill, and on recovery he resolved to be a musician. The master believed him to be a feather-brained student that was never likely to gain a sound knowledge of the art. WAGNER, however, produced an overture of so mazy a kind that, in order to make it intelligible, the part for strings was written in red ink, for the brass instruments in green, and for the reeds in black. He was able to get it rehearsed to the great amusement of the performers. The public could distinguish nothing except the rolling of the kettle-drums, and the piece was withdrawn after one hearing.

Fortunately for WAGNER he became acquainted with a cantor in a church, a man named THÉODORE WEINLIG, who was capable to understand a student with so much originality. He educated WAGNER, not by forcing him into a mould, but by drawing out his individuality. He started with the student's attempts at composition, and taught WAGNER by explaining his defects. As soon as the right road was reached WAGNER was told to depend on his own strength.

WAGNER felt that, unlike WEINLIG, his sympathies were with the theatre rather than with the church. He was much impressed with AUBER'S "Masaniello" and BELLINI'S "Romeo and Juliet," two works that have nothing in common with any of his own styles. But he found that the success of both depended greatly on the acting of Madame SCHRŒDER DEVRIENT, and henceforth he wrote some parts exactly as if they were intended for that singer. In his twenty-first year he was fortunate in obtaining the post of conductor in the Magdeburg Theatre, and there he acquired experience in mastering an orchestra. It is needless to say he was also made to know something about the precariousness of theatrical life, and he did not mend matters by marrying an actress. WAGNER was not captivated by what is to be found behind the scenes, and in his desire to be kept apart as much as possible from it he elected to live as far as he could from the theatre.

WAGNER had met old SPONTINI, a composer whose works are now more neglected than they deserve, and was struck with the scientific precision of the Italian master. He was also captivated with the melody that is spread over BELLINI'S operas, but had the good sense to feel that a gift of that kind must come from nature, and is not to be acquired. Probably he felt depressed when he compared their styles with his own, but the success of MEYERBEER, which was not due to melody, revived his hopes. He

* *Richard Wagner: Sa Vie et ses Œuvres.* Par Adolphe Jullien. Ouvrage orné de Quatorze Lithographies originales, par M. Fantin-Latour; de Quinze Portraits de Richard Wagner; de Quatre Eaux-Fortes, et de 120 gravures; Scènes d'Opéras, Caricatures, Scènes d'intérieur, Vues de Théâtres, Pièces autographes, Costumes d'acteurs, &c., &c. Paris: J. Rouam. London: Gilbert Wood & Co.

worked hard at his "Rienzi," and when two acts were complete resolved to try his fortune in Paris. There Wagner suffered much, but the three years' visit was of advantage to him. Next week we shall return to the subject, and meanwhile we take the opportunity of recommending M. Jullien's volume to every lover of music and of art in general.

(*To be continued.*)

A HISTORY OF STREATHAM.*

It was well said by Southey that whatever strengthens our local attachments is favourable both to individual and national character, and whenever a man cares no more for one place than another we may assume that he has no small amount of care for himself. There is little doubt that the local histories which come from Mr. Stock's press will do much to promote that form of attachment. Each of the authors has, or appears to have, a notion that his subject is more interesting than those taken up by the remaining writers, and this kind of championship is certain to end in producing a valuable series. Hitherto the histories treated of counties, but an experiment has been tried with a parish, and for that purpose Streatham was selected. We must say it is not a parish that can possess much interest for the historian or archæologist; but probably it was thought that, if Mr. Arnold's volume gained success, there could be little doubt about the fate of the histories of such parishes in the environs of the metropolis as happened to be the scenes of events that are worth recording. Mr. Arnold tells us that preceding attempts of the kind are "few in number and meagre in detail." Hundreds of books have been searched, he says, in order to cull the slightest information, and still he supposes there are omissions. We are unable to point them out, for we are surprised to find that Streatham could have a history. The only memorable event of the place we imagined was its connection with the Abbey of Bec, in Normandy. Among the inhabitants of the district were, we suppose, many admirable citizens who were men of mark on the Exchange and in the parish church; but goodness is a difficult subject to treat or to enjoy in a book, although it may be well suited to the epitaph-maker and the stonecutter.

But if Streatham is not rich in records, it can be supposed to be as important a parish in an historical sense as any in England. Nowadays archæology has become a science in which everything is allowed to be taken on trust. The great thing is to push the hypothetical as far as the available reams of paper will allow. This method is equally adapted to the history of an individual or of a district. Take the case of Shakespeare. There are hardly half a dozen circumstances told about him that are supported by an approach to evidence, but if we say to ourselves what would a dramatist, who lived in that age, be likely to do, and allow imagination a slack rein, it is easy (as we can see) to make out a big book. It may not be a whit more truthful than Henri Konig's romance, of which the poet is the hero, but readers will be sure to accept it as historical and rejoice in its possession. Streatham used to be considered by students of history to be as barren as any place between Dan and Beersheba. But under the new mode of treatment it becomes almost too fertile.

We are to suppose, in the first place, that Streatham means the ham or dwelling at the side of the street, which we are to take as one of the great Roman roads. It is not clear whether such a road was there, but that is of no consequence in our inquiry. We know that a well was found under the asphalte near the Streatham post-office, and what else could such a well be unless it was "the public drinking-place for thirsty wayfarers as they journeyed along the great highway, and it is just probable that it dates back to the great king of Deira's time." If we once can believe that the well belonged to the seventh century we have then got very near the Romans. It is as easy for the imagination to jump over nineteen centuries as twelve, or, as Shakespeare says, to turn the accomplishment of many years into an hour glass. Besides, three small brass Roman coins have been found in Streatham, and what more is needed to prove that the place was a military station?

There is no doubt that the land of Streatham parish has existed for a good many years, and that there was the usual variety in the ways of spelling its name when it had acquired one. In A.D. 675 it was conferred upon the Abbey of Chertsey. According to Dugdale the monks of Canterbury afterwards acquired it for their sustenance, Sandwich being set aside at the same time for their clothing. It is described in Domesday under the name of Estreham, and was among the land bestowed on Richard of Tonbridge. He made over Streatham and Tooting to the great Abbey of Bec, in Normandy, and Tooting-Bec is a record of the arrangement. The meaning of Tooting is one of the puzzles still left for the entertainment of archæologists, and it is open to the reader to suppose that it relates in some way to the Egyptian Thoth. Henry I. seized Streatham and Tooting, with other property belonging to Norman priories, and bestowed them on his brother, the Duke of Bedford. The manor often changed hands, according to the whims of successive kings. It was purchased at the rate of twenty-two years' value in 1553 by the Earl of Warwick. It was again and again sold, until finally it became a part of the Bedford Estate. Lord William Russell, who was murdered in 1840 by Courvoisier, becoming owner by gift, sold the manor in 1816, and at the present time some of the manorial rights are possessed by the Metropolitan Board of Works.

There is not a substantial memorial of antiquity in the parish. A succession of churches may have stood on the site of the parish church from time immemorial, but they have been cleared away without leaving a trace. The most that can be assumed is that the lower part of the tower has survived from the fourteenth century. An effigy of a knight which exists in a mutilated state is also supposed to belong to that time. The present church was rebuilt in 1831, under the direction of a Mr. Parkinson. There were complaints that he gave little attention to the work, and as the churchwardens were held responsible for the management, they were compelled, in self-defence, to issue a statement of affairs among the parishioners. When the works were completed the prejudice was not to be got over; the church was supposed to be dangerous to the worshippers, and it was found necessary to prop the roof with a large number of scaffolding poles before a congregation could be persuaded to attend the services. Afterwards Mr. Cubitt, the builder, took the building in hand, and there could be no doubt about his work being secure.

The secular buildings are not representative of any high antiquity. The manor-house is supposed to stand on the site of a house that was erected for the Abbot of Bec or his representative in England. Bec was one of the greatest of the Mediæval schools, and as late as the fourteenth century it possessed ten thousand students, numbers of them coming from this country. It was founded as a hermitage by an illiterate soldier in the eleventh century, and when Lanfranc, who was afterwards Archbishop of Canterbury, joined him, he saw the brethren were so poor that, as William of Malmesbury relates, he set up classes of logic for all comers, in order that he might support the needy monastery by what he received from the students. In those benighted days it was believed that a teacher was of more importance than apparatus or prizes, and, in some mysterious way, the intelligence of Lanfranc's experiment immediately spread throughout Europe. One of the chroniclers relates that not only princes and the sons of great nobles wended their way to the remote Bec, but also the masters of rival schools. It was from Bec that Vacarius came to Oxford in order to teach the principles of law. According to Wood, "rich and poor gathered around him," and Leland says that "he left no stone unturned to make the British youth flourish in the sacred tongues." Bec was, in fact, the headquarters of the old scholastic logic, which is now unfortunately a lost art, and there is nothing in the history of Streatham of which the inhabitants should be so proud as the connection between the great school of dialectics and their manor. Never was money better laid out than when the rents of the lands were applied to pay the teachers in the Norman abbey. Mr. Arnold is more oblivious of what was done in Bec than we expected from an author who presides over a school.

The Streatham manor-house, that may have been the successor of the abbot's lodging, has been so much altered

* *The History of Streatham.* By F. Arnold, jun. Elliot Stock.

that probably no part can be considered to be older than the seventeenth century. The eighteenth-century Russell House is now a reformatory. THRALE's house has disappeared. "The Shrubbery" was in JOHNSON's time occupied by a clergyman named TATTERSALL, who was an enthusiastic imitator of the fashion of the time for consecrating "temples" and busts to virtue and friendship. The clever Madame D'ARBLAY was unable to understand how any one could have a passion of that kind unless they were possessed of extensive grounds. She tells us that "he had so furious and so absurd a rage for building, that in his garden he had as many temples and summer-houses and statues as in the gardens of Stowe, though he had so little room for them that they all seemed tumbling one upon another." It is erroneous to describe a taste of that kind as a rage for building; it was rather a rage for gardening of a peculiar kind, if not simply a rage for "taste." According to the canons of gardening in those days, a rural scene was imperfect without something artificial, if it were only "a scar of rockwork," and the Rector of Streatham was merely doing on a small scale what other amateurs were able to do with acres. It is time we passed to some other notabilities of the place.

The patron spirit of Streatham is not one of the Norman owners of the place, but the old purblind representative of Grub Street, SAMUEL JOHNSON. When, in 1765, he made the acquaintance of THRALE, the brewer, who owned a big house in Streatham, JOHNSON had entered on a new period of life. He had outlived most of the friends and rivals who, like himself, were dependent on the precarious income which is the common reward of writers, and he was separated from the remainder by the dignity that belongs to a State pensioner. The dictator of the Literary Club could not be regarded by any of his old associates who contrived to survive as the man who was hunted by bailiffs, and lived on fourpence-halfpenny a day. Personally, there was no change in JOHNSON; but when he had ceased to be a literary hack, and was without any anxiety about the next day, something was needed to keep time from becoming a torture. He found what he needed in Streatham Park. JOHNSON looked on THRALE's friendship as an act of mercy, for which he was to be grateful. In his hypochondria he could turn to the honest brewer as a refuge, and it was no wonder he kissed the walls of Streatham Church when he had to depart from the place. During the greater part of sixteen years the THRALES afforded him a refuge from himself.

It is, therefore, proper that in the "History of Streatham" much should be allotted to Dr. JOHNSON and the THRALES. But the house in which they lived no longer exists. It was removed in 1863, and the whole of the grounds have been transformed. THRALE's mansion was described in 1778 as "a white house very pleasantly situated in a fine paddock," and we are informed that it had three floors, and the centre slightly projected from the wings. The gardens were on a sumptuous scale. Sir JOSHUA REYNOLDS suggested their abundance when he said that if every guest made a run upon one kind of dessert, there would still be some of that sort left. THRALE not only kept open house for the great men of the time, but he commissioned the President to paint portraits of twenty-four among them for the library. The pictures were sold in May 1816; the highest price, 378*l.*, was given for JOHNSON's portrait.

It must be owned that it is not difficult for JOHNSON to hold the topmost place among the celebrities of the district. The chapter on the "Worthies of Streatham" in the book before us will not send any reader to explore the district. THRALE comes first. Then we have BENJAMIN HOADLEY, D.D., a "celebrated divine," who held the living from 1710 to 1723. He was the fortunate author of pamphlets on Church government, for his theory of the absence of any right among the clergy to temporal power while princes possessed ecclesiastical power exactly corresponded with the ideas of the first GEORGE. The third and last worthy is a quack doctor named RUSSELL, who used to dress as a woman. Streatham has not attracted celebrities, and it is therefore difficult to make a history of such a place.

It was not selected by them as a residence while living, nor as a place of sepulture. The Streatham monuments are not interesting, unless to men who can be fascinated by the tombstones which are records of the most commonplace lives. One recumbent figure does exist in the part of the church that is dignified by the name of "the Crusaders' Porch," because of the tomb. The name of the subject was forgotten. At last a sketch of the figure was found in a manuscript book dated 1623, with a sketch of the armorial bearings. A further investigation brought to light a coat of arms in the Heralds' College resembling one on the tomb, and the arms were those of Sir JOHN WARD, of Surrey, in 1367. But who was the knight? The reader may imagine that Sir JOHN rebuilt the church, and took part in all the great events of his time. "It is highly probable," says Mr. ARNOLD, "that he served at Crécy and Poictiers; perhaps even he helped the Black Prince in his Spanish campaign." That is a typical specimen of the modern method of treating such subjects. It seems to have been derived from the historical novelist, who, as he is no longer needed for composing pleasing romances, appears to have turned an archæologist. There is a memorial of a rector in the sixteenth century named MOWSURTH. In the south-west vestibule is the monument of one TYLNEY, who was Master of the Revels to ELIZABETH and JAMES, and, according to the inscription, no less than eighteen earls could boast of descent from him. Another royal favourite was a MACNAMARA, "of the ancient family of Ardelauney," who was one of the privileged companions of GEORGE IV. before he came to the throne, for Streatham has had the honour of being the scene of "many of the disgraceful scenes and orgies which tarnish the memory of the Prince Regent." The epitaph on the exiled representative of the ancient MACNAMARAS could not be composed by any poet but the family bard. A few lines will suggest its affecting character:—

> At length, resigned to the great general doom,
> Here Macnamara consecrates the tomb;
> By Bedford patronised, to Moira dear,
> And even the Prince embalmed him with a tear.

There is something approaching the sublime in so novel a mode of embalming, but the zealous Royalist may doubt whether there was much that was preservative in a tear of GEORGE the Magnificent. Here we may fittingly end.

We consider that Mr. ARNOLD deserves a good deal of credit for making so much out of Streatham, which, if respectable, is a dullish sort of place. The next parish or manor may afford more scope for the historian's efforts. Surrey and Middlesex are too important to be each treated with a single volume, like a common county, for as an old writer says, "a little plot of ground thick sown is better than a great field which for the most part of it lies fallow."

THE EDINBURGH EXHIBITION BUILDINGS.

THE Council of the Edinburgh Exhibition having offered the great hall and other buildings to the Edinburgh Town Council, with sufficient funds for their conservation, the subject was referred for report to Mr. Morham, the superintendent of the works, and Mr. Cooper, the burgh engineer. The officers have presented a report, in which they say they have carefully examined the structure of the Grand Hall. The walls of the building are of brick, rough-cast outside, and lined with wood. The general roofing is glass at middle part, and corrugated galvanised iron at lower parts of slope, with boarding below, and supported on a system of cast-iron pillars and rolled steel roof principals and purlins. The reporters beg to submit that, in their opinion, the following works are required to put the structure in a state of efficiency for the purposes of a public hall. The removal of the other parts of the Exhibition building necessitates a wall being built to close in the end of the east transept of the Grand Hall, having a suitable façade towards the outside, which might consist of a portico somewhat in the form of the present vestibule, but of more durable material and construction, with two flank buildings, having furnace rooms for heating apparatus below, and lavatories above. The small towers flanking the entrance on the west side are of wood, and should be reconstructed in brickwork, finished with cement cornices and beltings of the same material. The straight parts of the roofs, which, as before mentioned, are of glass and corrugated galvanised iron, should be carefully gone over and put in thorough repair. How far this iron roofing may be relied on for durability, the reporters have not the requisite information to enable them to form a decided opinion. At present it appears sufficient, and may reasonably be expected to last, say, for ten years. The central dome and those at the angles are covered with plain galvanised sheet-iron, which, from

the manner of fixing, may be expected to be injuriously affected by changes of temperature. These should have the present coverings removed and sheet lead substituted. The outsets from the gutters have been found insufficient in times of very heavy rainfall, and should be enlarged or increased in number, and the gutters should be provided with a proper arrangement of snowboards. The entire space within the building should be covered with asphalte, to keep down damp and preserve the floor timbers from decay. The present floor, which is formed with spaces between the boards, should be covered with 1½-inch grooved and tongued close boarding, care being taken to preserve sufficient ventilation below. To render the hall fit for occupation in winter, an effective system of heating would be required. The hall is at present fitted up for electric light, on the removal of which a system of lighting by gas would be required, and this could be so arranged to aid the heating and ventilation. The entrances would require to be protected by suitable screens, to break the connection with the external air and prevent draughts. The manager's office and model houses, though not specially mentioned, are understood to be included in the remit. These are in good repair, and though the walls of the office are of wood, they are well protected both above and below. Some alterations internally would be required to adapt the office buildings as a dwelling-house. The probable cost of the works immediately required to put the buildings in a proper state of repair and efficiency, exclusive of furnishings, the reporters consider cannot be stated at less than 3,500*l.* With regard to the second portion of the remit—the prospective cost of maintenance—from the nature and extent of the structure it may be assumed that a sum of not less than 200*l.* a year would be required, exclusive of the expenses incidental to heating, lighting, and oversight, which, however, would probably be chargeable to the revenues to be derived from entertainments. The reporters are of opinion that the works they have suggested would all be required, in view of the buildings being permanently taken over; but even in the event of a tentative arrangement, say for three years or less, a considerable outlay—rather more than one-half the sum above mentioned—would be required. The Town Council have declined to accept the buildings.

THE ORDNANCE SURVEY.

A SERIES of Ordnance sketch maps on the large scale of Birmingham and the neighbouring district may now be seen in the Council House. During the past two years the survey of the town has been in progress, and it is not yet complete.

In many respects, says the *Birmingham Post*, Birmingham is peculiarly situated in regard to the survey. By its proximity to the border lines of three counties it is materially interested in the Boundary Department. The preparation of the boundary maps is totally distinct from other branches of the survey, and the work is directed from the head office in London. Application is first made to Quarter Sessions, and the justices appoint suitable persons called meresmen for each parish to assist in ascertaining the boundaries. These men are not necessarily surveyors, but are well informed in regard to their parishes. When all the appointments are made, a thoroughly experienced surveyor, called "the ascertainer," is sent down, and he traverses the boundaries in the district allotted to him. Great assistance is of course afforded him by the meresmen, and his work is materially facilitated by the information derived from the tithe and parish maps, which are produced for his guidance. Having made his examination, he records the results in a book, indicating by different methods the disputed, doubtful, and defaced boundaries, concerning which he obtains the best evidence he can, and embodies it in his report. The dubious points are then settled by the boundary officer in London, after which sketch maps are drawn and forwarded to the parish authorities for public inspection, before they are adopted as final. From this outline it will easily be seen how important it is that the sketch maps should be carefully inspected by every one possessing or interested in property upon or in proximity to the border lines of the counties.

Coming next to the detailed survey of Birmingham and the suburbs, it may be remarked that the operations are of a singularly interesting character. A great deal of preliminary work had to be accomplished before the labours of the surveyors, plotters, and examiners were reached. It is now about two years or more since trigonometrical observations of Birmingham were commenced. With the tertiary triangulation before referred to as a basis, more points had to be fixed, so as to still further divide the triangles. The observing parties first established their stations upon the highest points in the town and neighbourhood. One of the first stations noticed was the one erected on the summit of Moseley Church, and this for a long time was a great object of curiosity, and there was considerable questioning as to what was going on. This station—or "crow's nest," as it is also designated—remained on Moseley Church, from which a good view of the town and surrounding country may be obtained, for two or three months; and then a second was observed on the top of St. Paul's Church, Balsall Heath; while yet a third appeared on St. George's Church, Birmingham. Doubtless there were other "nests" in different parts of the town, but the three mentioned were the most conspicuous, both on account of their great height from the surface of the ground and the long time they were maintained in their somewhat perilous positions. The observers from these stations were able to fix their points, which they marked by means of good stout poles, bearing small flags, upon the particular spots they had decided upon. Some of these poles were also a novelty in their way, their singular appearance exciting the interest and wonderment of all who saw them. They were stationed on some of the principal public buildings and highest factories in the town, such as the Council House, the turret of the Exchange, and Messrs. Cartland's factory in Constitution Hill. They remained in position a very long time—sufficiently long, in fact, to enable the observers to fix upon a large number of intermediate points, lying within from one hundred to three hundred yards of each other, all over the town. These smaller points were marked by means of iron bolts fixed in the ground. The streets are dotted with them at the given distances, but so quietly and unostentatiously was the work pursued that very few people even now know of the existence of such marks. Sometimes they were inserted in the pavement, where they still remain part of the surface; but, generally speaking, they are to be discovered in the roadways. After the town had been carefully marked out in this way, the distances were calculated, and then the detailed labour of measuring, plotting, and examining began. This branch of the work devolved upon the officials connected with the two divisions to which, as previously stated, Birmingham and the neighbourhood belongs. The greater and most important part of Birmingham is in the division commanded by Captain Hellard, R.E., whose head office is at Derby. The remainder of the district is in the Ipswich division, under the superintendence of Captain Sykes.

A short explanation of the work done from the Derby office will suffice as a description of the operations carried on. The detail survey was first begun at the end of June 1885. With Birmingham is included Aston and parts of Handsworth, Smethwick, Balsall Heath, &c., the total area to be surveyed on the maximum scale being about 11,250 acres. With a staff of three superintendents, with thirty surveyors and their labourers, this area would have taken nine months to survey had the work been carried on continuously; but the work in towns is, as a rule, only carried on, as far as the surveyors go, in summer for the three or four months when crops prevent their working in the agricultural districts. In consequence of this their work has extended over two summers.

In carrying out this work, a superintendent first carefully traces lines from one observed point to another, and then a triangle or block thus enclosed by main lines is allotted to each surveyor, who first chains these lines, and then proceeds to chain such other lines inside his block as the detail may require; the ends of each such line being fixed by references on two other lines already chained, offsets being taken and the details being sketched in on the ground in a "field book" as each line is run. Two illustrations may be given of the manner in which the work is done. A fairly good triangle is obtained in Bell Barn Road and Great Colmore Street, with Grant Street at the third side. The surveyor, first of all, finds the bolts, and, guided by them, measures each side of the triangle in a straight line with the chain, and if any projection from a house or building intervenes to prevent the line being straight then that obstruction is marked by what is known as an "offset." Having got his main lines correctly, the surveyor cuts up the triangle into smaller triangles or blocks, always, however, proceeding in a straight line. The surveyor is ignorant of the actual length of the sides of the triangles or blocks as calculated from the trigonometrical observations, and, therefore, he has to observe great care to insure accuracy, or his work will not be accepted. Of course, where so much detail is required the surveyor frequently has occasion to enter upon private property; but in this respect he is more fortunate than the examiner who follows him, and whose work is still more of a detailed character. Each surveyor is supplied with a certificate indicating the nature of his business, and when he has occasion to enter a court or yard, he frequently is called upon to produce his authority. It is his duty, too, to measure the gardens attached to residences, and he, therefore, has often to ask permission to go through a private house. For the credit of Birmingham it may be said that the officials have of late met with little difficulty in these matters. The surveyor includes in his measurement all gardens at the rear of a house, the extent of the garden walks, even to the ornamental paths round the shrubs. In addition he distinguishes the rows of houses, the avenues of trees, or even single trees of tolerable dimensions. He takes note of the tramway lines, obtains the width of the canals and streams, and adds all structural outbuildings—in fact, he includes every piece of

important detail on the ground. As each surveyor finishes his work, his field-book is forwarded to Derby, where the work is "plotted." Each triangle or block, it should be borne in mind, is completed before another is begun, and therefore within about three months from the commencement of the work the plotters can enter upon their duties. The surveyor's field-book is first given to a "line plotter," usually a man of great experience, who lays down the surveyor's lines on the plan according to scale. He sees that the main lines as measured agree with their lengths as calculated, and then he lays down the subsidiary lines; but if the work will not plot with accuracy, it is returned to the surveyor for correction. The lines having been found correct, however, a fresh plan is prepared and handed to the "detail plotter," who fills in all the offsets along the lines laid down, and also the details from the field-book. A staff of fifteen plotters, if engaged solely on the Birmingham work, could complete it in nine months; but here also the staff is necessarily engaged on other work at the same time.

The plans, after leaving the plotters, are traced, and a copy supplied to an examiner, who immediately examines every bit of work done by the surveyor. He goes over the whole ground traversed by his predecessor, makes all the necessary corrections, and, in addition, fills in the plan in a more detailed manner. He indicates the manholes, fire-plugs, lamp-posts, water-plugs, ventilators, pumps, sewer gratings, verandas, mile-posts; he enters on the plan all projections, all the gravel paths and ornamental grass plots and trees that may have been omitted by the surveyor; he distinguishes glass from brick and stone structures, marks out all fences and ornamental shrubberies; he sees that the streets and terraces are accurately named; he inserts the names on the plan of all important residences, indicates all bay windows, and particularly specifies the pavements and the ordinary roadways. In short, the examiner must not omit a single detail on the ground. A staff of thirty examiners, if employed solely at this work, could complete Birmingham in nine months; and similarly, if followed up by thirty-eight draughtsmen at an interval of three months, the plans would be drawn in nine months. When his work is finished the examiner sends the tracing back to the division office, where the corrections and additions are made on the plan, which is then coloured, and all the names and trees, and everything for which there is a conventional sign, are stamped upon it. After the plans leave the draughtsmen they are examined, and then passed to an officer, who takes them into the district, and personally tests a portion of the work. The work in the office at Derby is then concluded, and each plan is forwarded to Reading, where the levelling is done. The levels showing the height of the streets above the sea are inserted upon the plan, which is then despatched to the chief office at Southampton for publication.

It will thus be seen that the work of producing an Ordnance map is no short nor easy task. The detailed work is enormous, and as each process follows in the wake of its predecessor at intervals of three or four months, every department is soon busily engaged. Owing to the large extent of both divisions, however, the work in Birmingham could not proceed continuously. The actual surveying will be concluded in about two months, but the final process will not be reached before April or May 1888. The work generally in the country, it may be added in conclusion, is rapidly approaching completion, and it is hoped by 1890 the survey of the United Kingdom will have been successfully and satisfactorily accomplished.

TESSERÆ.

The Apollo Belvedere.

VIKTOR RYDBERG.

NERO'S age seems to have given rise to a peculiar type of Apollo which, in two or three works of art, has come down to our own days. The foremost of these works is also one of the most admirable that we have from the time of the later antique—the world-renowned *Apollo Belvedere*. For him who writes these lines this statue has a peculiarity apart from its æsthetic and art history. I am bold enough to think that it is evidence risen from the grave of Nero's struggle with his pangs of conscience. He wished to have before his eyes the assurance that blood-guiltiness can be atoned for, and with this silent purpose caused some prominent sculptor to create, or perhaps after a Delphic model to copy, an *Apollo Catharsius*. The statue was dug out towards the end of the fifteenth century at Antium, Nero's birthplace and favourite city, from the ruins of a villa, believed to have been his own. The figure then wanted the left hand and all the fingers of the right, and with them the attribute they bore has disappeared. Critics have, therefore, up to the present time been in doubt and have exhausted themselves in conjectures as to the action in which the god is represented. The commonest explanation is that the artist has thought of the moment when Apollo, to shield his sanctuary at Delphi from the plundering hordes of the Gauls, advanced in person, ægis in hand, to meet them and put them to flight with lightning and wirlwind. Overbeck, who approves this opinion, imagines the god placed in this action between the *Artemis* of Versailles and the Capitoline *Athena*. But recently Carl Bötticher has irrefutably shown that the figure must have borne in its right hand, lowered, the Delphic lustral whip, a remnant of the knotted lash of which he discovered on the tree-trunk that serves as a pedestal. Now the lustral whip was the Pythian Apollo's attribute in his quality of atoner of blood-guiltiness. There lies something of a suddenly-blinding revelation in this figure. With the left arm outstretched in menace or protection the god hastens with majestic wrath towards an object which has unlawfully approached his sacred precinct. Carl Bötticher thinks of the scene in the "Eumenides" of Æschylus, where Orestes, the matricide, pursued by the furies, has burst into the temple of Apollo and embraced its altar. He further thinks that the divinity sees at the moment the goddesses of remorse forcing their way into the sanctuary, and, with the boa in the left hand, angrily meets them and drives them from the temple; and after this completes, with the whip of purification, the act by which the blood-guiltiness is to be expiated. This does not entirely accord, no doubt, with the description of Æschylus, but meets it at the principal point, which it was enough for the artist to strike. No figure could better than one like this remind the new Orestes that a conciliation with the divine powers was possible, and none were better adapted in his dark hours to shine with a hope of peace.

Niches.

SIR W. CHAMBERS.

Niches being designed as repositories for statues, groups, vases, or other works of sculpture, must be contrived to set off the things they are to contain to the best advantage, and therefore no ornaments should ever be introduced within them, as is sometimes injudiciously practised, the cove of the niche being either filled with a large scollop shell, or the whole inside with various kinds of projecting rustics, with moulded compartments, either raised or sunken, or composed of different coloured marbles, for all these serve to confuse the outline of the statue or group. It is even wrong to continue an impost within the niche, for this is of considerable disadvantage to the figures, which never appear so perfect as when detached and backed on a plain smooth surface. An excess of ornaments round the niche should likewise be avoided, and particularly masks, busts, boys, or any representation of the human figure, all which serve to divide the attention, and to divert it from the principal object. The depth of the niche should always be sufficient to contain the whole of the statue, or whatever else it is to contain, it being very disagreeable to see statues or any other weighty objects with false bearings, and supported on consoles or other projections, as is sometimes done, and in the case of niches the side views become extremely uncouth, for in these a leg, an arm, a head, in short those parts alone which project beyond the niche, appear and look like so many fragments stuck irregularly into the wall.

Milan Cathedral.

W. WHEWELL.

The cathedral of Milan is so celebrated as a grand Gothic edifice (Madame de Staël says it is the masterpiece of Gothic art in Italy), that I shall, perhaps, be excused if I speak of this church in particular. I regret to have to dissent where others admire, but I am obliged to say that Milan has no claim to be considered as a good example of Gothic architecture. In order to possess excellence in this, as in any other style, a work must have the requisite parts clearly exhibited and well proportioned. Now, the principal parts of the interior of a cathedral are the piers, the pier-arches, the triforium, the clerestory, and the vaulting. At Milan scarcely one of these members can receive a critical approbation. The piers are of imposing bulk and height, but lose much of their due effect from having no proper capitals; and the group of niches which crowns each pier, displacing the capital, ruins entirely the relation of these supports to the rest of the edifice. The pier-arches, thus cut off from their pillars and thrown into obscurity, hardly catch the eye. There is not any attempt at a triforium; and the clerestory, also, is quite frittered away by being cut into two portions on each side. For there are five aisles, and of these the centre one is higher than the two immediately adjacent, and these again than the exterior aisles, the clear elevation of each higher part being pierced by small windows. In this way a single clerestory wall of sufficient elevation is replaced by two smaller descents, and thus this member loses all its characteristic appearance. Lastly, the vaulting is not striking as an architectural work, though very brilliant as to its painted decoration. If we pass from the interior to the exterior, we shall still find a defect of consistent architectural principle.

The west front, though fringed with pinnacles, is not formed of decided Gothic features; the sloping lines of the magnificent flying buttresses, strongly marked and often repeated, become the leading lines of the building, because they are not stopped and controlled by commanding masses of vertical pinnacles at their lower ends, as is the case at Cologne and other genuine Gothic churches which possess such members. Finally, even the forest of pinnacles which crowns this gorgeous edifice fails to give an upward character to its outline, for each of these pinnacles is a well-executed statue; and though such ornaments, in subordination to other upright masses, are quite consistent with the Gothic spirit, they are felt, in the present instance, to transgress this condition. The numerical strength of this marble army makes it the governing power; the statuary domineers over the architecture, and we collect, out of all this host of personages and attitudes, no definite lines and regular forms, such as alone can give architectural effect.

Brick Backing.

W. Hosking.

It will generally be found that a brick wall built with mortar and faced with ashlar has settled inward to a greater or less extent, as the work has been more or less carefully performed. Indeed, in the nature of things, it cannot be otherwise, unless the brick backing be worked in some cement which sets and hardens at once; for the outer face is composed of a layer of unyielding material, with few and very thin joints, which perhaps do not occupy a fiftieth part of its extent, while the back is built up of an infinity of small parts, with fully one-eighth its height of joints, which are composed of material that must both yield to pressure and shrink in drying. Some part of the ill effect attendant on this is obviated by the bond-stones, which tail in or run through the wall, and tend to keep the discordant materials together; but still much of it remains, and, besides this, the internal or cross walls, which have no stone in them, will either settle down or shrink away from the external walls or drag them onward, as they happen to be well or ill bonded or tied. For these reasons, brickwork built in this manner with masonry should be executed with exceedingly well-tempered mortar, made with no more lime than is absolutely necessary to cement the particles of sand together, and the sand again to the bricks, worked as stiff as it can be, and laid in as thin courses as may be to answer the purpose required of it. Above all, work of this kind must not be hurried, but allowed time to dry and shrink as it goes on.

Origin of Mural Decoration.

Gottfried Semper.

The earliest woven work would seem to be the fence, that is, branches of trees interlaced, serving the purpose of enclosure and of partition. The most savage tribes are acquainted with this method of construction. Thus the employment of coarse tissue or woven work (which was a mere fence) as a means of securing privacy from the world outside certainly far preceded the constructed wall of stone or of any other material; this last only became necessary at a much later period, for requirements which in their nature bear no relation whatever to space and its subdivision. New inventions soon led to different methods of replacing the primitive drapery, and every art was successively called in to contribute its part to these innovations, which may have been brought about by various reasons, such, for example, as the desire for longer endurance, for the sake of cleanliness, economy, comfort, distinction, coolness, heat, &c. One of the most ancient and most general methods of replacing the use of drapery or tapestry is the coat of stucco or of plaster furnished by the masons who built the walls. Another very ancient method of replacing the original tapestry is that of wooden panels, with which the wall was covered internally. The style of mural painting in Pompeii is only to be understood by the same ancient custom of covering and inlaying the walls, which they produced in appearance by divisions and painted draperies. The ceramic art was in its turn called on as a means of replacing drapery. It is certain that potter's clay painted, and even glazed, served at a very remote period as a covering for walls. It may even be admitted that the employment of the potter's art on the surface of walls preceded the manufacture of burnt bricks, and that the invention of burning bricks was the result of the custom cited above. The mural incrustations in baked clay were the precursors of brick masonry, in the same manner as the Assyrian slabs may be considered as the forerunners of constructions in hewn stone. Among the various methods of replacing the use of drapery should be also mentioned those furnished by metallurgic processes. Vestiges of metallic coverings on walls have been found on the oldest existing monuments, and the most ancient annals of mankind are filled with recitals of buildings resplendent with gold and silver, bronze and tin, respectively. As an invention of recent date may be cited, lastly, the use of slabs of marble or stone, granite, alabaster, &c., notwithstanding that we find traces of this custom, but generally effaced, on the most ancient monuments of the earth. In all the cases we have named, the character of the substitute followed that of its original type, and in the painting and sculpture, or rather the two united, in wood, plaster, burnt clay, metal, stone, or ivory, was, and traditionally continued to be, an imitation more or less faithful of the embroideries or variegated interlacings which ornamented the antique wall-coverings. It may be asserted that the entire system of decoration with the art of painting or sculpture in relief, up to the period of its highest application, which is that of the tympanums of the pediments in the Greek temples, proceeded from the manufactures of the Assyrian weavers and dyers, or rather from their predecessors in human inventions.

Qualities of Slates.

G. F. Richardson.

The quality of a good slate is that it should cleave readily, that the laminæ should be straight and unmixed with foreign substances, and the more finely laminated it is the larger plates will be obtained. Slate for roofs should be dense and not porous, and it is best judged, like other stones, by the sharpness of the sound. Porous slates are bad, because they swallow water. Sulphur is a dangerous ingredient, and sometimes exists in particles so minute as to be imperceptible. This mineral when mixed with water produces vitriolic acid, and so promotes decomposition. To detect its presence heat the slate with wood embers, and if it exists it will give forth a sulphurous smell. Oxide of iron mixed with slate has a sympathy for air and water, and so increases the quantity of oxide or rust. Calcareous matter is equally injurious, and may be tested by observing whether it puffs up when exposed to muriatic acid. Carbonaceous or coaly matter may be detected by burning. With regard to its colour, yellow or black spots indicate the presence of oxide, and black that of carbonaceous matter.

Robert Milne, Architect.

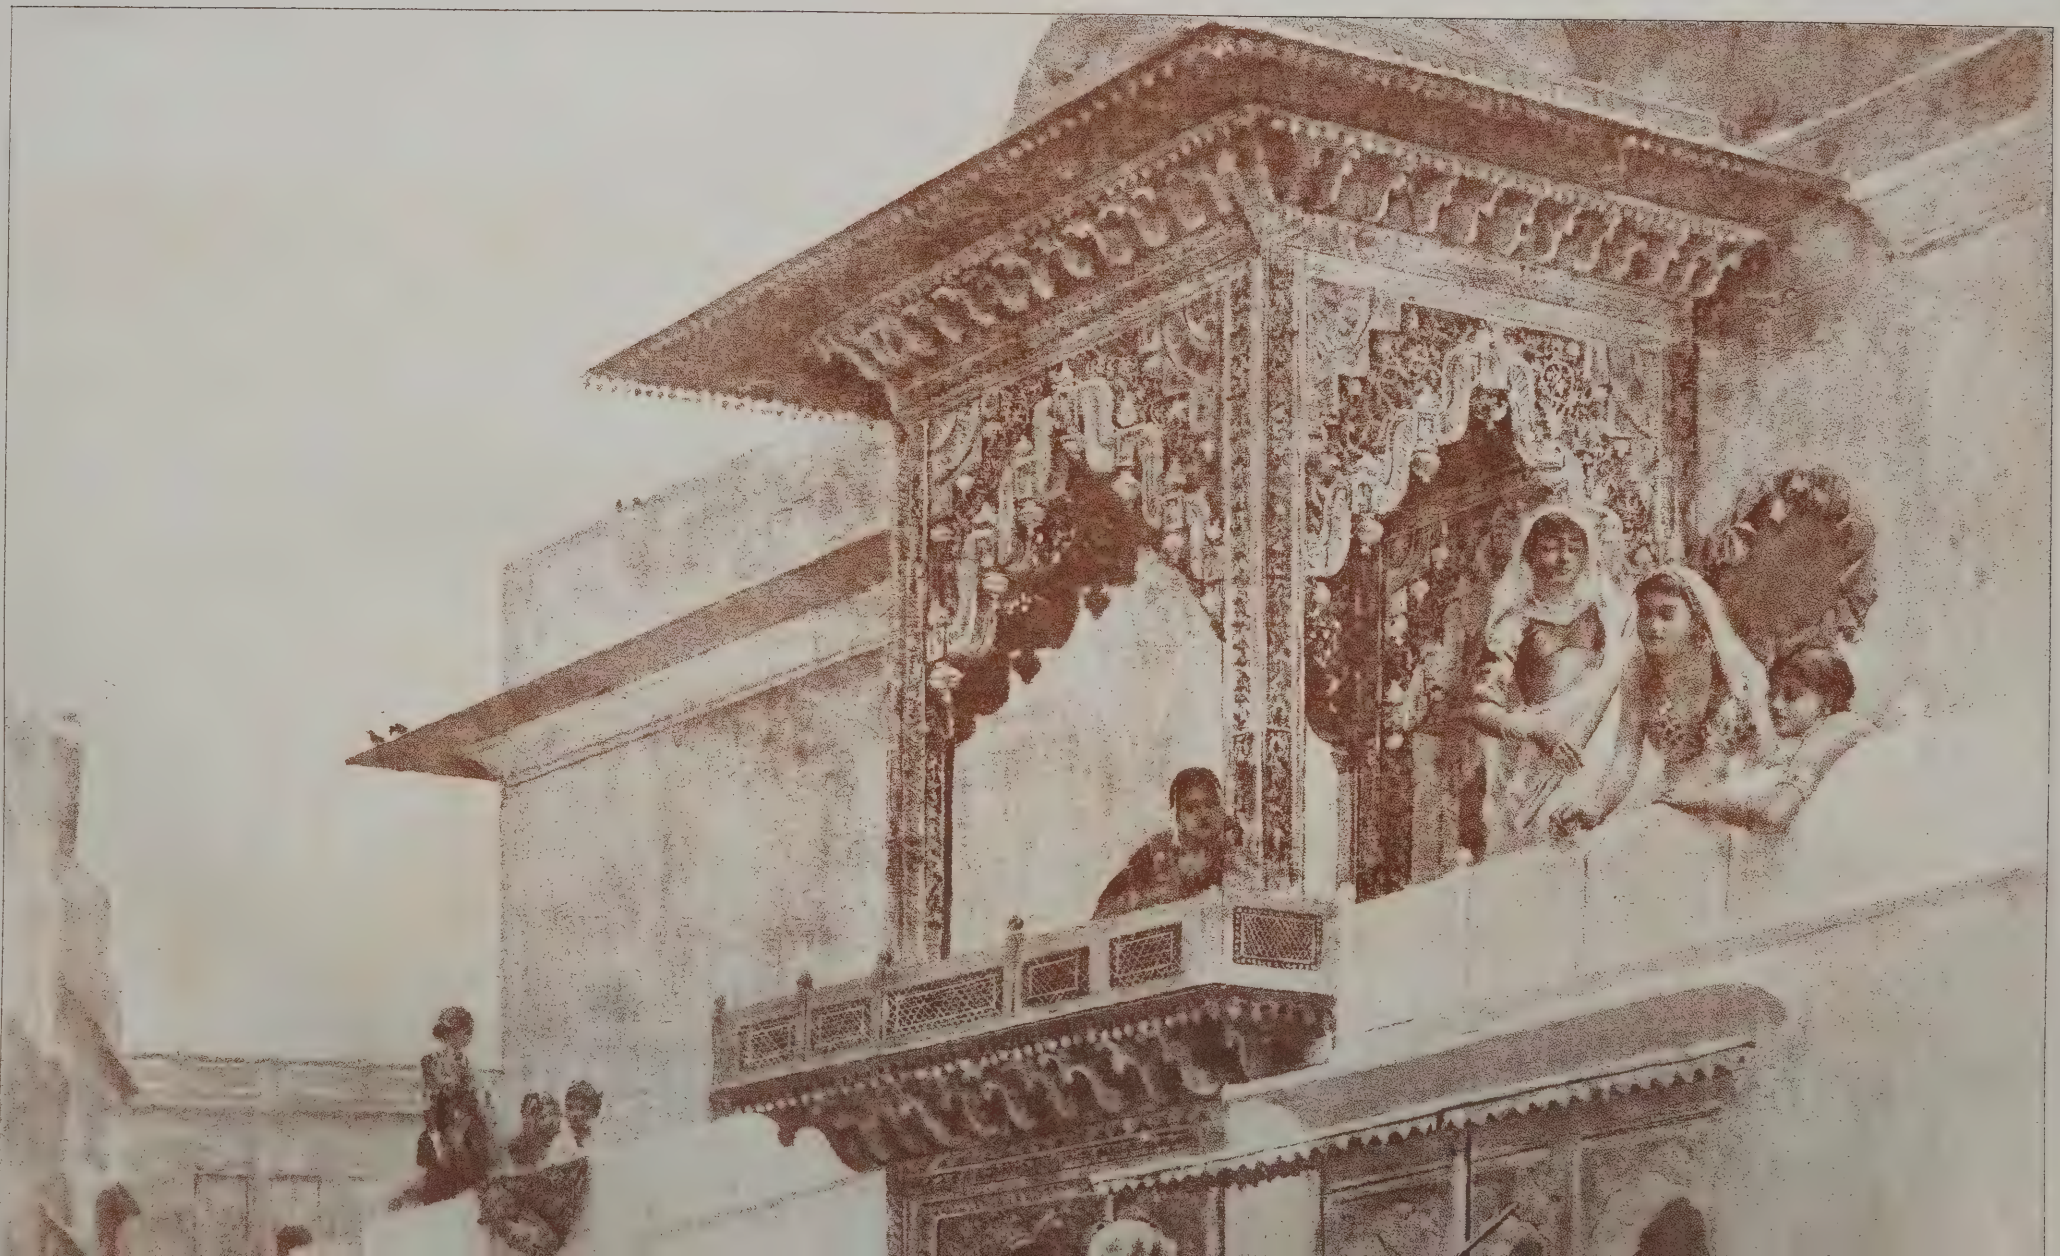
J. Elmes.

Robert Milne was a pupil, I believe, of Robert Adam; at all events, he was of the same country and school. Like Wren, he exhibited precocious talents; for, scarcely at the age of manhood, he triumphantly bore away the first prize in the first class of architecture at Rome. He had the honour of being the first Briton who obtained a premium for art in that city. Before he had completed his studies in Rome he sent over in competition, and conquered all his opponents, by his Blackfriars Bridge, a work of skill and some originality. Milne's style was too decidedly Roman for the day; but, to his honour be it spoken, his love and affection for our great metropolitan structure, St. Paul's, of which he long held the place of surveyor, was such that he never would see it defaced or altered, or spoiled in any way; and scarcely a week of his long life passed without his giving it a personal survey. Milne never did anything better than his Roman design, which was in every way worthy of one of the best disciples of one of the best architectural schools the world has ever produced. It formed a becoming ornament of his study, or *sanctum sanctorum*, at his residence at the New River Head, Clerkenwell. I have often admired it in my youthful days, with its Italian inscription, "Primo premio Roberto Milne, Scozzese, Roma," with its date and something else which I have forgotten, or perhaps never understood, Italian being in those days as great a stumbling-block to me as St. Paul's doctrine was to the Greeks; and I feared even to ask this architectural Aristarchus anything more than the mere subject before us. He was a man of austere manners, of violent temper, and appeared to have a contempt for every art but his own, and for every person but himself. In some of his ebullitions of temper he has been known to kick the clothes and tools of workmen, who have dared to reply to him, out of windows and into holes in the streets, and has been obliged to fly from the effects of their excited wrath. One of these, an Irishman, said that "Mr. Millen," as he called him, "was a rale jintleman, but as hot as pepper and as proud as *a* Lucifer." Peace be to his remains, which quietly repose by the side of his great predecessor, in that noble cathedral which was built by the one and sustained by the other. This architect is not known for many other works than his Blackfriars Bridge; a few bridges, and perhaps one or two mansions, in Scotland; the buildings and machinery of the New River Company; and a very commonplace elevation to the east front of Stationers' Hall, Ludgate Hill. The principal employment of his latter years was that of architectural curator to St. Paul's Cathedral, architect and surveyor of buildings to the Stationers' Company, and engineer to the New River Company; dividing his time between his two official residences at either end of that river—its spring or source at Amwell, near Ware, in Hertfordshire, and its other end in Clerkenwell, erroneously called the New River Head—it being the reservoir which supplies by steam machinery such parts of the metropolis that are served by the company.

NOTES AND COMMENTS.

THERE is some talk in Paris of forming a fine art museum for the city. Every year pictures and statues are purchased, which are soon lost to sight. They cannot all be placed in the Hôtel de Ville. Then there are constant competitions for the decoration of mairies which it would be well to exhibit in one place. The city also possesses one of the finest collection of tapestries in the world, but the pieces are known only to a few people. For the display of so many classes of work there could be nothing better than a special gallery, and it would he well to have it arranged before the world goes to Paris in 1889.

SKETCHING clubs are excellent institutions, for in them the amateur can work without any injury to himself or his neighbours. When he exhibits a picture that is supposed to be finished as much cannot be said. The Dublin Club has gained more success than was anticipated, for in a time like the present the majority of amateurs in Ireland are not in the mood to enjoy fine scenes in nature and to make transcripts of fleeting effects. The club lately invited a few of the English clubs to contribute sketches for exhibition, and, as Englishmen are always willing to respond to any rational request from Ireland, a great many drawings have gone across the Channel. The exhibition of them opened on Monday. About fifty examples are contributed by the Langham Sketching Club, the Bewick Club, Newcastle-on-Tyne, send thirty, and the Athenæum Graphic Club, of Manchester, a similar number. The Dublin Sketching Club deserves the goodwill of English artists in its endeavour to diffuse a love of art through the island. At present there is little. Any landscape painter who has gone to Ireland for subjects can testify to the want of understanding of art which is to be found there. The provincial in England is supposed to be backward in art, but he is an advanced critic if compared with an Irish country gentleman.



PEERS have of late tried their hands in many kinds of business, but what is to be said of one becoming a curator of a museum? The following remarkable epistle relating to an appointment of the kind was read at last week's meeting of the Bath Council:—"Lord TRURO presents his compliments to the Town Clerk of Bath, and begs to ask whether in his opinion the offer of a collection, comprising some 5,000 pieces of archæological (pre-historic) remains would be accepted by his Corporation. Lord TRURO is not in a position to make such an offer; but there is a collection in which he is interested, and he is, therefore, anxious to gather information with a view to its disposal. It may be added that the donor would make as a condition that he should receive the appointment of curator (with a salary)." At present Bath has not space in a museum to accept a proposal of the kind, and the objects will have to find their way elsewhere. But few corporations would care to invest in a collection of the kind unless it was obtainable at a nominal sum. Prehistoric archæology is not attractive, as may be judged from the scarcity of visitors to the Christy Collection.

EVERY year it becomes more evident that few of the art schools under the Science and Art Department can be made self-supporting if they are efficiently conducted. Nottingham, which is always successful in obtaining a large share of the allowances from the Department, shows a deficiency of 266*l.* in the accounts of the past year, and many other schools are also compelled to have an excess of expenditure over income. It is not satisfactory to have the addresses at annual meetings taking the form of charitable appeals, which is now a common case. A good deal of the indifference to the schools on the part of the public arises from want of confidence in the Department and its advisers. We have repeatedly said that if the schools are to be successful the examiners will have to be strengthened by representatives of the trades in which art is an element. Is a Nottingham manufacturer likely to be liberal in support of the Government system when he reads the following statement about the way in which the staple trade of the town is treated:—"Our designs for lace have again been unsuccessful. Some explanation of this is to be found in the desire of the examiners to encourage those classes of designs in which human and animal forms can be used, and to the great importance attached by them to colour. The figure and animals, so far as they have hitherto been used in lace, have been much more grotesque than beautiful, while the addition of colour, though it may be useful in the market as a novelty, must be condemned on artistic grounds. Thus, by the nature of the material they work in, our students are placed at a greater disadvantage than their predecessors." If in Nottingham it is well known that a combination of birds and flowers will not serve as a profitable pattern, the conclusion must be that the Departmental officials are either unaware of the requirements of trade or are indifferent. In either case the manufacturers must be chary of giving money to a school that is only useful in proportion as it evades the regulations of the authorities.

ACCORDING to *La Construction Moderne*, a new paving material is under consideration in Paris as a substitute for wood blocks. It is proposed to impregnate bricks with asphalte—probably bricks of an open grain would be used—and it is said that by the process they become elastic as well as impermeable. The roadway is solid and affords a foothold for horses.

M. DAUMET, the architect of the restoration of Chantilly, gives some account of the works in a late number of *La Construction Moderne*. They were commenced in 1876, and were completed in 1883, with the exception of the iron baluster rail and the bronze "torchères," which were recently fixed. The limestone used in the works was taken in part from the site, part was drawn from quarries in the neighbourhood. Local contractors were employed on the works as well as specialists from Paris. On the decoration which remains incomplete only a few artists were engaged. The bas-relief over the principal entrance is by M. MANIGLIER. The statue of St. LOUIS which crowns the façade of the chapel and the bust of HENRI IV. in the grand vestibule are by M. MARQUESTE. The figure of the Blessed Virgin with the surrounding angels, in the chapel, are by M. WATRINEL. The stained-glass windows have been completed and restored by M. BARDON, after the designs of M. LECHEVALIER CHEVIGNARD, who has also charge of the decorative painting in the Salon d'Europe. As we have already stated, it was the late M. BAUDRY who painted the *St. Hubert* and the *Psyche and Mercury*. M. BARTHÉLEMY modelled the "torchères" for the grand staircase.

THE increase in the number of fires within the metropolis is not easily explained. The firemen and salvage corps have enough to do without undertaking an investigation of the subject. A few weeks ago Messrs. BLADES, of Abchurch Lane, called the attention of the Metropolitan Board of Works to some remarkable circumstances connected with fires on their premises. The firm lately occupied part of a block in Skinner Street, which was divided by a party wall. On one side of the wall was a factory for making shot and shell. A fire occurred on July 28, and everything on Messrs. BLADES's side of the party-wall was destroyed. No cause for the fire could be discovered. In the course of a few days a second fire broke out among the *débris* left by the first fire. It was then found that on the other side of the party-wall were eight furnaces for casting shells and other purposes, and that the flue for the furnaces was against the party-wall. But whether the making of shot in such a place gave rise to the fire, or whether there was another cause, was not ascertained. Messrs. BLADES suggest that in every case of doubt an inquiry should be held, evidence taken, and the cause of the fire sifted, as is done in the case of sudden death. From the reply of the Metropolitan Board of Works, the obstacle to such an inquiry is found in the Home Office. In 1883 the Board informed the Home Secretary that it would be well that there should be an official inquiry held by some officer other than the coroner into the origin of fires in cases where the Secretary of State or the Board might consider necessary, and the Board was prepared to pay for any inquiries it might order. Nothing has been done by the Home Office, and the Board cannot move without authority.

TRAVELLERS FROM CASHMERE IN DELHI.

EACH of the American artists who make Paris their home tries to discover a special province for himself. Mr. HEALEY keeps to portraiture, Mr. KNIGHT to French peasants, Mr. BOGGS divides his attention between the sea and buildings in Paris, Mr. BRIDGMAN takes Turkey, and so on. Mr. E. L. WEEKS, as we said some time ago, may claim to have discovered India. An English painter occasionally takes the bold step of a journey to the Eastern empire when he has a commission beforehand, but under such circumstances he cannot have many opportunities to study the country. Hence, from the time of DANIELL, the Indian pictures by English painters are more suggestive of lifelessness than of life. The people represented correspond with the specimens that were lately seen in pens at South Kensington, and who had a good deal of automata about them. Mr. WEEKS's pictures are not in that style. He goes among the people of India in the same way that his brother-artists mix with the peasants of Brittany or Finisterre, and he has consequently found that our fellow-subjects in the East are not always squatting or torpid. Mr. WEEKS's pictures are, in fact, a revelation to many, and it is no wonder they always occupy prominent positions in every Salon exhibition. It is not only the novelty of the scene that attracts, but the splendid colour, which, with all its richness, is so well harmonised that it never appears garish when surrounded by harmonies in grey and yellow. The picture which we illustrate, by the kind permission of Messrs. KNOEDLER & Co., of New York, is a characteristic example. The travellers from Cashmere have much to relate, and feminine curiosity is no more to be restrained in Delhi than in the West. In a little space a vision of life is afforded, and the thoroughness of Mr. WEEKS's work is evident from the care he bestows on the architecture.

ARCHITECTURAL ILLUSTRATION SOCIETY.

NO. 35.—PART OF HOUSE AT CROMER.

PROSPECT TOWER.

THE illustration shows a prospect tower designed to be erected at Clacton-on-Sea, but owing to the depression the company has not yet been formed. The tower will be 180 feet in height, and for the enjoyment of a view of the surrounding country and the sea, which the various galleries and rooms will afford. As the neighbourhood in which it was proposed to erect has not so much natural elevation as some seaside towns, this building will prove a great and novel attraction from which visitors can command the extensive panorama of land and sea on every side. The different levels of the galleries will be reached by a convenient passenger lift and staircase. Each floor will be fitted with accommodation for visitors. There will be refreshment-rooms, lavatories, reading, smoking, conversation, and other rooms. All the apartments will be fitted with large windows, giving access to the balconies, which will be covered in, so that the whole will form a delightful promenade and lounge. If the number of visitors using the pier is a criterion, the project is one likely to prove remunerative. The architect is Mr. HENRY OUGH, of 16 Austinfriars, E.C.

LINCOLN CATHEDRAL: SOUTH-WEST TOWER.

THE present drawing of this tower shows that portion as seen above the screen of the western front, and corresponds with the one on the north side. The lower portion, or Norman tower, erected by Bishop ALEXANDER, had originally highly-enriched projecting gables, of which those on the north and south remain. Those on the west were removed on the completion of the façade in the Early English style in the middle of the thirteenth century; the ridge lines of these gables, however, remaining behind the later screen wall. The lofty belfries which raise the Norman towers to a height of 200 feet may be assigned to the period of 1390. They were originally terminated with tall, slender spires of wood, covered with lead, but in consequence of the expense of keeping them in repair they were taken down in 1807.

The illustration is from a drawing by Mr. EDWARD M. YOUNG, of Lincoln.

THE ARCHITECTURAL ASSOCIATION.

THE second ordinary meeting of the Association was held on Friday evening last, Mr. J. A. Gotch, president, in the chair.

The following gentlemen were elected members:—Messrs. C. S. Haywood, E. H. Dawson, S. C. Baker, H. Sanders, R. Y. Hammond, E. Wyon, J. Andrews, A. H. Noble, A. C. Smart, H. St. John Knight, L. J. Kempster, W. J. Martin, J. H. Jacques, H. J. C. Cordeau, W. F. Marshall, P. Foncard, T. B. Pemberton, A. W. Jarvis, F. L. Sealy, A. Mosley, W. Jane, A. Ford, H. Waterson, T. W. Gray, E. A. Nott, W. A. Lewis, E. R. Barrow, H. A. Woodington, G. F. Terry, S. R. Greenslade, J. Ellwood, A. H. Pearce, H. Berry, L. J. Veit, G. F. Collinson, H. V. Fanchester, R. Hall, V. E. Young, W. C. Howgate, H. Emerick, A. Rollins, J. S. D. Ahmedi, H. H. Fox, P. H. Currey, B. S. Wagstaff, H. J. Leaning, J. W. Drewington, C. A. Garrett, T. H. Hull, J. A. S. Jones, J. A. Verini, F. A. Coles, R. S. Harrison, F. J. Jones, T. Batchelor, A. McGarel Hogg, and P. L. Forbes.

Votes of thanks were unanimously awarded to Mr. J. L. Robinson, A.R.H.A., for his donation of photographs, and to Mr. Wm. White, F.S.A., for a copy of his paper on Restoration.

Mr. H. D. APPLETON, in reference to a notice in the Brown Book in regard of the South Kensington Library, said those who desired to have their tickets renewed should send him their last year's tickets, not their passes.

Mr. ASTON WEBB then read a paper, the main portion of which is reproduced as follows:—

Pupilage.

Mr. WEBB said:—I am afraid I must take it as certain that in many cases the relations of master and pupils are rather strained, owing, perhaps, to a misunderstanding of the relative duties of each, and we should naturally turn in the first place to the form of articles to learn what the respective obligations are. Personally I was never bound by formal indentures, neither have I ever had, up to the present time, a young man formally bound to me. I dislike the idea, and prefer an annual arrangement, which can be terminated without trouble simply by the wish of either party. In such arrangements it is merely an understanding that a young man enters an architect's office with a view of participating in the work, and by the assistance of his master acquiring a knowledge of the practical working of his profession. This puts a master under as strong a moral obligation to do what he can to forward his pupil's interests as the strictest indentures, and is, to my thinking, more consistent with the feeling that should exist between master and pupil. However, we must naturally turn to the stricter indentures to find what is legally understood by a young man being articled to an architect. I have had several copies of these indentures lent to me by friends, and a perusal of them seems at once to carry me back almost to Mediæval times, as much from the quaintness of their requirements as for that of their diction. A good deal is said of what the pupil is to do, but not so much of the master. These seem to be some of the obligations laid on "the said" pupil:—

"That he shall and will during the said term of years faithfully, diligently, and honestly, and to the best of his power, skill, and activity, give him the said architect as a pupil in the said profession, art, or calling of an architect, and that the said pupil shall not at any time during the said term wilfully obliterate, injure, spoil, damage, waste, destroy, misspend, or misappropriate any of the property, money, instruments, utensils, goods, or chattels of him, the said architect, and further, that the said pupil will at all times keep the secrets of the said architect, and will at all times during the term readily and cheerfully obey and execute his lawful and reasonable commands, and shall at all times conduct himself with all due propriety, honesty, and diligence."

"Also, that the pupil will provide himself with all manner of necessaries, with becoming apparel, and also physic and surgery in case of illness," to which curious programme is sometimes added "that he shall not play at cards, dice, tables, or other unlawful games: that he shall not contract matrimony within the said term;" or commit other crimes too serious to mention. After which formidable programme comes a paragraph to say that "the architect, his administrators and assigns [what the latter know of architecture I do not know] will [probably for a certain consideration] at all times during the said term of years teach and instruct the said pupil or cause to be taught and instructed in the said art, profession, or calling [always great difficulty apparently in deciding what it is] of an architect in such sort as the same is or hereafter may be carried on by him, the said architect, to the best of his knowledge, skill, and ability." Well, now, the terms of such an agreement are apparently so strict and impossible to be absolutely kept on either side that probably both break through them in less than a month. I mention them to remind those here who are pupils of the extent of the obligations imposed upon them. But I purposely omitted in this account of indentures the time for which

a pupil was articled. Fifty years ago this was usually seven years; then it was reduced to five years, and since then has been further reduced, in many instances, to three years. This is a detail of importance. Now, putting aside all Mediæval or other verbiage, what is the meaning of these articles? Very roughly put, I believe the understanding is that a young man goes into an architect's office to learn how a practice is carried on, it being an obligation on the architect's part to give all the facilities he can to a pupil to learn it both in the office and out of it. He does not undertake the post of a schoolmaster, as some seem to suppose, and probably most young men at seventeen or eighteen would resent being so treated. He rather assumes that a young man at that age is not too young to understand that he is there to learn, not to play; though I am bound to say some seem to think that if they only attend an Academy or Association class in the evening they can spend their pupilage time much as they please. Possibly in many offices they can do so; but surely they should remember the all-importance of these pupilage years to themselves. You can comprehend that these years of pupilage are fraught with momentous consequences to yourselves. Even three years wasted and dawdled away, as they often are at the commencement of a career, means to many a life wasted and dawdled away. Three years of good work means love of work and business habits acquired. Perhaps you say, "This merely applies to architecture as a business; I follow it as an art." I reply that possibly, if you let your art entirely master the business of your profession, you may find hereafter the business entirely swallow up your art.

Architecture is the one art which combines the necessity for art and business capacity, and the greatest names in the architectural roll of fame are those who have most thoroughly combined them.

Some have made a name for their art capacity only; hundreds have made a practice from their business capacity chiefly; but the greatest have been able to build great buildings by their genius in uniting the two, and architecture is the art of erecting beautiful and useful buildings, not only of designing them.

Well, then, taking it you agree with me that a pupil should not expect to be taught in an architect's office as if he were at school, let us consider what he has a right to expect. It is evident that in a term of three years he cannot expect to acquire a thorough knowledge of his profession, or even as much as he did in a term of seven years; but I think he has a right to expect that he should have free access to all that goes on in the office, and that, further, his master should give him such instruction as he can, and should in all cases advise him in the course he should take in obtaining further knowledge unobtainable in an office from such classes and lectures as are provided at the Royal Academy, Royal Institute of British Architects, King's and University Colleges, and last, but not least, the Architectural Association. That he should be expected to give them one or two hours' personal instruction every day appears to me absolutely impracticable for an architect in active practice, however desirable it might be.

Before going to my second point, let me say a word as to the relation between master and pupil. This should be one of mutual confidence and respect. The latter has the free run of the office of the former, and can, if he pleases, become intimately acquainted with all the details of his master's business. The pupil sees his master at work, and, perhaps, finds he is not infallible; and as it is said no man is a hero to his own valet, perhaps the same may be said of a master and pupil, though the pupil should remember that Carlyle suggested this *might* be the fault of the valet. On the other hand, though the architect must not be considered as a schoolmaster, the pupil has an undoubted right to look to him for advice and help in all matters connected with his architectural education, and to expect that he should put him in the way of acquiring a special technical education, which can be far better learned outside than inside the office. The great advantage of the office training is that a pupil has the opportunity of seeing how work is actually performed, and how an architect, with his clients, builders, and others connected with the building trades, conducts his business in real life, and none of these matters can a young architect afford to neglect. On the other hand, if he is a wise young fellow he will endeavour to gain as much information from the office as he can on his own account, without expecting his master, should he be in full practice, to be constantly especially instructing him.

Mr. Blashill read a paper on this subject before the Association ten years ago, and in that he expressed an opinion that pupils should be allowed to read all the office correspondence. This is a detail that was somewhat contested at the time, though I think there can be no question they should be enabled to do so.

I next come to the disadvantages or grievances which one hears most frequently from articled pupils and the best way out of them. Now, I have talked with a great many pupils, and these are some of the most general complaints I hear.

First and foremost of all, that they have too much tracing to do, or that there are too many pupils in the office and not enough draughtsmen; or that (if they are in a London office) they do too much office work and do not go on buildings enough; or that (if they are in the country) *vice versâ*; or that their master has too much work to do and cannot teach them; or that the work is all of one class; or that it was all surveying and specifications; or that they never see any surveying or specifications; and many more such like.

Well, I agree with you that these are to some extent grievances and should be ventilated, and I should hope in time will be ameliorated, but they will not be in your time; and what I want to do, if I can, is to suggest some ways by which you can help yourselves to get over these difficulties. No sensible man can doubt that there are many cases in which a pupil has every reason to complain, or that others complain without any just reason.

It is difficult, for instance, to sympathise with those who complain that they are in so large an office with a great deal of work and so many to do it that there is no opportunity for them, while it is very easy to sympathise with those who find themselves in an office where their master is much employed out of it, and where the principal work is copying specifications and schedules of dilapidations, and their sole companion an office boy, while the tedium of the long days in the little elevated office is only relieved by the occasional tramp on the creaking stairs of the inevitable cadger.

Now, to take the grievances in detail: the first is tracing, and I say at once I think pupils often have too much of this to do. On the other hand, it is undoubtedly one of the best means by which a pupil can get into the habit of architectural drawing. Some acquire it very quickly, others take years before they can trace properly; some learn while they trace, all could if they would by thinking about it. It also gets a pupil into the way of delineating work and placing it on the paper in an intelligible manner, which he would probably not otherwise learn, and if all these sources of satisfaction should fail him, then is the one left experienced by Carlyle in "honest journey-work well done for want of better." Mr. Christian, I think it was, told a story here once of a pupil who came to him and mentioned, amongst other things, that if he was articled he should like to do nothing derogatory to a gentleman; and being asked to explain, said he should not like to do anything which he could not do with his gloves on, and I believe it was added that this young gentleman came to no good. Of course you cannot trace with gloves on, and you will have to take them off, and your coat, too, if you are going to study architecture thoroughly, and not be too squeamish at the work that is set you either. The next grievance was that there were too many pupils in the office, and there again I agree to some extent. I know some architects who think it would be beneficial to limit the number of pupils to be taken by an architect to two, as is already done in the law, and though this might be well in the majority of cases, we all know some offices where it is eminently to the advantage of architecture that the largest number of pupils should be trained that the master is willing to instruct. It would be invidious to mention them, but you know them without it.

Then, again, those who are in London offices complain that they see little of executed work, and no doubt much of the work designed in many London offices is executed in the country; and where this is so I would say to the pupil, avail yourself to the full of the Architectural Association Saturday afternoon visits, and the numerous opportunities there are always open in London to inspect works in progress. Surely, of all places in the world, London is the place where this complaint should not be made, while the immense advance lately made in the work carried out in the offices out of London shows that here also, if a pupil is so minded, he may see good work and improve himself by it. With respect to the grievance that one master has too much to do and another too little, it should be remembered that in the first case a pupil must have the opportunity of seeing much work go through the office, in the other he will probably have the advantage of more personal attention from his master, and it is practically impossible to have it both ways.

I should now like to show how, in my opinion, a pupil may make the best of his opportunities in whatever office he may happen to be; that is to say, how he can best learn an architect's business, without which he will never be able to develop or exercise whatever power of design he may be possessed of.

The first year of his pupilage he should have some personal instructions from his master, and take part in whatever subordinate work in the office he may be set to do, taking all the time as much interest as he can in the business that is going on. In the second year he should join the Association, and do other work outside, which it is not my province to-night to describe. Then he should start what I would call a commonplace book; in other words, an illustrated note-book, in which he should put down the leading points of drawings passing

through the office, and especially those coming under his immediate notice to ink in, finish off, or trace. All points of construction, scantlings of roofs, and such varied items as dimensions of a stable, details of a church, school seating, sanitary traps, or whatever it may be, should be carefully noted down and arranged for easy reference, and if he steadily did this during his pupilage he would amass an amount of practical information that would prove to be of inestimable advantage to him afterwards; and if this paper of mine to-night is but the cause of a few of you starting such a book it will not have been thrown away; and, while on the subject of this commonplace book, I would suggest to those who complain of the want of variety of work in the office they are in, that they might easily arrange with others to exchange information with those in other offices, and thus add to their own stock of knowledge and that of others at the same time; and though this presupposes a very considerable amount of interest on the part of pupils, it is surely not too much to expect. I do not believe there is a master in London who would grudge his pupil the time to do this if he found he was doing it thoroughly.

Then as to specifications and contracts. Some pupils at the end of their articles are perfectly innocent of these things, but if they have never taken the trouble to copy those that are always in use in the office they must not lay all the blame on their master. They are in the office for the purpose of seeing these instruments in actual use, and I would recommend this as an admirable exercise to any young man who would take the trouble, viz., to take a set of contract drawings in the office and write a specification from them without help, and afterwards compare it with the working office copy.

Again, you should occasionally take your own cube of buildings being erected in the office, and find out their cost and note it in the commonplace book at per foot cube; but I have said enough to show you what I am driving at, viz., that it is to the advantage of every pupil to take an intelligent interest in the work going through the office, and that not merely in the interest of his master, but for his own sake.

Another point, which is somewhat outside, perhaps, the regular office work, but for which, I think, opportunities should be given, is architectural sketching. I am sure it is possible to collect a large number of sketches in so lazy a way that they are practically no good to the student. Water-colour sketching, for instance, is a delightful relaxation, but is of comparatively little value for the purpose of study.

I believe that nothing would help the student more than the habit of sketching from memory, both old examples and new. There is no greater test of how far you have really understood anything you have sketched than by trying when you get home to redraw it without reference to your sketch-book.

You will be surprised at first how little you remember, and afterwards how the practice strengthens your memory. If any of the pupils I am speaking to would try when they get home to sketch a bay of any building they know well, they will be surprised, I fancy, to find how little they really know about it. The same practice is equally useful in respect of modern buildings, and if you select any fairly good building you pass on the way to your office, look at it carefully, and try to draw it from memory, returning time after time until you have it complete, and then another, and so on, you will not find the time spent thrown away.

No pupil should neglect to consult the committee of advice started by this Association if he is in any difficulty and is unable to get help from his master.

One word to those pupils whose articles are just expiring. This is, perhaps, the most difficult time of all to a young man. He has views of taking an office, and perhaps chambers in town, and setting up a door-plate, &c. If he has only served for three years he should do nothing of the kind, but rather remain in the office where he was articled, or enter another as a salaried assistant, and in his spare time read up for the Institute examination, and try for one of the travelling studentships, with a fixed resolve to go abroad for six or twelve months when he has been five or six years in the profession. It is a mistake, in my opinion, to go sooner. If he is not fortunate enough to obtain a travelling studentship, and cannot go without one, he should at least endeavour to live very quietly and save up for the Italian excursion of this Association; not that you should return with the idea of erecting buildings in the Italian or Grecian taste in this country, but that you may have your eyes opened to the marvellous works which men of genius have been able to raise in other countries than your own.

Mr. Webb concluded with some advice to students in regard of reading.

The President, in the course of his remarks, enlarged on the opportunities open to them in pupilage, and said they should make the most of those opportunities. Much depended on the office they got into. In some they were left too entirely to themselves. Architects ought to help their pupils on, but on the other hand, if pupils were indifferent, and did not take the least interest in their work, they could not expect the master would take an interest in them. Mr. Webb's advice to keep a commonplace book was important. Life was so complex that memory unassisted would not carry a man through; he could not recollect everything, but if he knew where to lay his hand on the information as the need for it arose it practically served the same purpose.

Mr. R. Phene Spiers, who proposed a vote of thanks to Mr. Webb for his paper, remarked that he had never gone through the stage of pupilage. He had been sent to the Ecole des Beaux-Arts, Paris, and on his return entered an architect's office as an improver, and had had no cause to regret it. He pointed out the great fault of articling pupils before they could understand the work in an architect's office, and referred to his suggestions at the last conference of architects, that the student on leaving school should attend courses such as those at King's College, and last but not least, he should go through the workshop. A student would learn nothing of architectural work till he learned to think for himself. Those who joined the Association, and attended its classes, necessarily learned to think for themselves, and then they would be able to start a commonplace book with profit. Certainly a pupil when articled should join the Association classes, if only the junior class of design. A pupil had a perfect right to copy anything in the office, make extracts from specifications, &c., in his own time, of course, not in his master's. As a clerk he had no such right.

Mr. John Slater seconded the vote. He expressed the wish that parents could be got to understand that as good an education was required for an architect as for men of any other profession. Business letters of architects not only should be shown to pupils, but pupils should be made to try and answer them. Unfortunately all architects could not express themselves grammatically. He urged them to cultivate more particularly any special bent they had, as a man was more likely to get on, in this age of specialists, in the branch he was most thoroughly well up in.

Mr. Lawrence Harvey said he had been through two Continental schools, and could testify that the system of education in the Association was not a whit inferior to the systems abroad, and with a few improvements it would be far superior. In supplying the supplementary knowledge that could not be got in the architect's office, the Association had done much, and in a year or two the Guilds would afford the same knowledge as was got abroad. Considerable improvement, at little or no expense, would be got if work, such as was done in the ateliers abroad, were done in the architect's office here. The assistance the master gave to his pupils might be recognised by giving the name of architects whose pupils were successful in competition, &c. As to sketching from memory, Mr. Harvey said that abroad they never were set to drawing without also having an exercise in drawing from memory. In two or three months it became easy, though at first it had seemed nearly impossible to do. Mr. Harvey mentioned that in the class of masonry initiated by the Association, the first class for the instruction of the pupil-teachers would begin on Tuesday (the 9th inst.), and the subsidiary class, to be taught by the first mentioned, would begin on December 14. Whatever some might say to the contrary, none could teach so well as those who had just learned.

Mr. Sidney Vacher recommended all as soon as they began their pupilage to join the Association, and take part in the elementary classes. Entrance into the Academy school he advised to be postponed as long as possible.

Mr. Arthur Baker spoke of the great gain got by taking a clerkship of works as soon as a pupil was out of his articles. He agreed with Mr. Slater up to a certain point in regard of specialism, but practically an architect must often consent to share the profits he might get, or else he would come to grief.

Mr. H. O. Cresswell, speaking of the examination, said they would not find it so very dreadful when it came off.

Mr. M. Clarke thought the Association might issue a ticket enabling the holders to see works in progress.

Mr. H. D. Appleton, hon. secretary, said that architects were rather shy in giving them permission, and at present they had permission for no buildings. He did not think the Association would be allowed to issue any general permission.

After remarks from Mr. Brodie, Mr. Leonard Stokes, Mr. F. Miller, Mr. H. Baker, and others, the vote of thanks was carried by acclamation.

Mr. Webb, in the course of his reply, remarked that Mr. Harvey's proposal to couple the architect's and pupil's names would have probably no weight with architects.

Mr. Harvey said that was so, but explained that he meant that the public would be made aware that the pupils of certain architects always gained prizes, and therefore that "their shop" was the right one to go to.

The meeting then terminated.

The Halifax Town Council have decided to purchase the Bankfield Estate, formerly the residence of Mr. Edward Akroyd, the borough member, for a public park.

MANCHESTER ARTISTS AND THE ANNUAL EXHIBITIONS.

A MEETING of the members of the Manchester Arts Club has been held to consider the conduct of the Art Gallery Committee in the management of the City Art Gallery and the permanent collection. Mr. J. H. Nodal presided, and briefly explained the objects of the meeting. He did not want, he said, to utter a single word of reproach against the Art Gallery Committee with regard to the care, time, and attention they had bestowed on their work. At the same time, there was a good deal of dissatisfaction abroad with respect to some points of their management, and an idea prevailed that on these points they had adopted mistaken principles, or had gone on wrong lines. The initial difficulty under which the committee laboured was that of the arrangement they made with the proprietors of the Royal Institution. The conditions with regard to the representation of the proprietors on the committee, and the amount to be spent annually in the purchase of pictures, fettered them in several ways. He therefore moved that a memorial should be presented to the Art Gallery Committee of the City Council, calling their attention to the following recommendations :— 1. The selection of works from London galleries should be brought within narrower limits, and two Manchester painters should be added to the hanging committee. 2. That for the purposes of the annual exhibitions the corridors and lower rooms should not be used. 3. The desirableness of following the example of the Paris Salon, where at the middle of the term the gallery was closed for a time and the whole collection rearranged. 4. A revision of the agreement with the governors of the Royal Institution is desirable; and 5, the committee should cease the practice of placing the pictures forming the permanent collection, and those lent from South Kensington, in a room which was bare, gloomy, and repellent. Mr. H. Magnus seconded the motion. A discussion followed, in which other grounds of complaint were discussed. Mr. T. R. Wilkinson then defended the action of the Art Gallery Committee, and deprecated the presentation of the memorial on the ground that it would do more harm than good. Ultimately the motion was carried almost unanimously.

MESSRS. KNOEDLER'S GALLERY.

THE *Art Amateur* gives the following account of the latest pictures which have been brought from Europe by Messrs. Knoedler & Co., of New York :—

Recently there have been some charming additions at Knoedler's gallery. *The Weeder*, an exquisite little canvas by Jules Breton, shows the stooping figure of a peasant woman illumined by the last rays of the sun, which is just sinking beneath the horizon, the pale crescent of the new moon having already appeared. The picture tells eloquently and most poetically the story of another day's work done. A glowing Henner—the bust in profile of a handsome, pale-faced woman, draped in black, with a wealth of auburn hair descending from her superb, patrician head, relieved against a dark crimson background—is unnamed; but it surely must have been intended for *Romola*. A small Chelminski is a characteristic snow scene, with two military cavaliers. I take one to be Frederick the Great, who seems to be acknowledging, in passing, the salute of a young cavalry officer. Meyer von Bremen is represented by a miniature canvas, showing a smiling young peasant coming from work, with his scythe over his shoulder and a posy in his hand, evidently intended for the comely maiden who, hidden from his view, looks up eagerly from her needlework at the sound of his footstep. *On the Field of Honour*, by François Flameng, tells the story of an improvised duel in the snow. The principals have got out of a coach and are ready for the fray, the witnesses to which are some military looking men in the costume of the Directory, and a knot of peasants who have stopped to see the performance. The combined expression of fright and curiosity on the face of the old woman is particularly well portrayed. There is a strong single figure, by Lerolle, of a French peasant woman in a sheepskin cloak; a Moorish interior by F. A. Bridgman, showing a houri reclining on a divan, chiefly interesting for its colour; and a charming little Israels, a fisherman and a lad returning from work, wading through misty grey water. But Knoedler & Co.'s great prize is *Le Goûter*, by Jules Breton, a group of barefooted peasant women reclining around a wood fire, which is cooking their noonday repast. M. Breton is said to have received a larger price for this picture than for any he had previously painted, showing that the great success of *The Communicants* at the Morgan sale, for which Mr. Donald Smith paid 45,500 dols. (Avery had sold it to Mrs. Mary Morgan for 22,000 dols.), was not without effect on his prices for subsequent commissions. Among other pictures from the Salon bought by Knoedler is Jean Paul Laurens's dramatic painting of the ferocious Torquemada before Ferdinand and Isabella, holding the crucifix before them and insisting on the expulsion of the Jews from Spain.

CLASSICAL ARCHÆOLOGY.

THE Class of Fine Art in Edinburgh University was opened with an address by Professor Baldwin Brown, upon the study of Classical archæology as twofold. In the first place, he said, it brought us into contact with works of genius which have been the models for all the world in some important branches of human activity; and, in the second, it brought clearly before the mind the ideas and outward life of the peoples of antiquity. With these Classical literature has already made us familiar, but the work of art brings before us at a glance the thoughts of men of old time in a more vivid way than when they come wrapped in the garb of language. The hero as he is described in Homer and Sophocles, the athlete glorified in Pindar's song, the trained rational citizen of Plato and Aristotle —in a word, the highest conception of Greek humanity was brought before us as a whole and in a moment in the form of the Theseus of the Elgin Marbles. The study of Classical archæology is no mere antiquarian poring over details or dilettante trifling, but a serious effort to read and master the records entrusted by the greatest nations of antiquity to marble and bronze and clay. Modern experience can give us no idea of the large place occupied by the arts in the life of ancient peoples. The Secretary for Scotland had happily said that music was the democratic art. All arts in old time were democratic. Sculpture and painting are now arts for the few. Architecture—in view of the way in which architects are sometimes treated—seems hardly to be considered an art at all; but in old times the statue and the picture, with the building where they were placed, formed the books of the people—they read there all that was most of interest to their lives. It is an illustration of the importance of artistic monuments in the past to find that the recent "History of the Ancient Peoples of the East," by Professor Justi, of Marburg, might almost be looked upon as a history of art. Turning to the question of the limits of the study of Classical archæology, it is clear (1) that all forms of ancient art, and not the principal ones alone, such as sculpture, must be included in the study, and attention must be paid to various historical phases, and not to the period of perfection alone; while (2) the arts of Greece and Rome cannot be treated satisfactorily without a reference to those of the more ancient peoples of the East. To Winckelmann, who began the study of ancient art in the middle of the last century, only one form of art was of real interest—the perfectly developed statue in which he recognised the embodiment of a certain Hellenic ideal. In the present day we are enabled, and therefore constrained, to take a wider view. Greek sculpture has many phases—it has rude beginnings and tentative efforts. It is a development, not a creation. There are also, beside sculpture, numerous minor forms of art, including painted vases, terra-cotta figures, gold jewellery, &c., not one of which can be neglected. Since Winckelmann's time important original works of the Grecian chisel have been placed in our museums, the principal of which are the sculptures from Ægina, placed at Munich in 1820; the Elgin Marbles, ceded to the British nation shortly before; and the German "finds" at Olympia and at Pergamon in the last ten years. Each has its characteristic importance. The Æginetan sculptures show art at the most critical stage of its progress, about to pass over from the severity of early times to the beauty and freedom of the period of perfection. The Parthenon marbles exhibit the utmost that sculpture could achieve at the point of culmination of art in the Athens of Pericles. The fragments from Olympia, almost contemporary with the Parthenon, show interesting modifications, due, perhaps, to local separation from the great artistic centres; while, finally, the reliefs from Pergamon at Berlin, representing a late period of Greek art hitherto almost unknown, give startling evidence of the extraordinary vitality and many-sidedness of the Greek artistic genius. The question of the connection of Greek art with that of older peoples is quite a modern one. The monuments and inscriptions of Egypt, Assyria, Chaldæa, Phœnicia, Asia Minor, have all been explored and interpreted, since the beginning of this century, and we find evidence that almost all the elements of Greek civilisation existed in their original forms among these Eastern peoples. The laying out of cities in rectangles, according to regular plans, though it may seem so characteristically Hellenic, is yet an ancient Babylonian, perhaps also Egyptian, custom. The elements which made up the Greek temple are found, differently combined, in Phœnicia and Egypt. Many of the details and ornament of Greek architecture are found elsewhere. The statue was not a Greek invention, and even in the specially Greek quality of life and animation Hellenic statue makers had been preceded by the Egyptians of the old empire, some of whose wonderfully lifelike productions were shown in photographs.

The same may be said of almost all the other forms of Greek art down to the engraved gems which are some of the earliest works of art found within Hellenic borders. It is essential fora proper treatment of Greek productions that we should illustrate them by what had been done by older peoples. By tracing out the origin of all these forms of Greek art we arrive at a sort of "natural history" of them. The scientific spirit of the day demands that we study their development from small beginnings. This is, however, only one side of the work of the Classical archæologist. This antiquarian study is valuable and necessary, but it is not all. When we have finished it we find ourselves face to face with the more important question, What was the finished result in itself? what its value to Greece and to the world? Every true work of art is a thing by itself; on its material side it may be only one of many, but, as a finished work of genius, it is individual and distinct. The Athene Parthenos of Pheidias was in its material construction only a development out of very old and rude forms of idol-making and decoration. What Pheidias did was to charm a soul into the wood and gold and ivory, and the old materials became alive; a new personality was born. Mr. Ruskin has taught his countrymen to ask themselves what great works of art can be to them, not how much can be discovered about their origin. So, after all, the best way with a fine work of Grecian genius is not to see how much we can say about it, but rather to let it speak to us with its ever-new message of power and its spell of beauty.

NORTHERN ARCHITECTURAL ASSOCIATION.

THE first meeting of the winter session of the Northern Architectural Association was held on Monday, at the Old Castle, Newcastle-on-Tyne. The president, Mr. G. G. Hoskins, F.R.I.B.A., delivered the following address:—

Gentlemen,—In thanking you for asking me to address you, I think some apology is due from me for my bad attendance—or rather non-attendance—at your meetings for so very many years past, the loss being mine.

Professional Depression.

Now, firstly, as to the condition of our profession generally. I am sorry to say that the last eight or ten years have been, to the majority of its members at least, I was about to say years of rest, but such rest as I fancy many of us would have willingly dispensed with. No doubt plums have fallen to the lot of some, but the state of the profession—taking it throughout for the period I have named—has been, and is, I regret to say, unquestionably bad. But let us hope that this lull or depression—or shall I continue to call it rest?—may not have been entirely without its benefits to some of us. It has given us time for thought, time to digest new subjects—which are always cropping up in our profession—time to realise and review our blunders, and, like Captain Cuttle, "when found, make a note of 'em," for avoidance in the future; time for that thought and study generally which some of us at least could not find during the high-pressure pace which the prosperity of these Northern districts some years ago required of us; for I am very much afraid it was with us as with other classes—and also the masses—there was the same hastening to become rich, the same confidence that "the race would be to the swift and the battle to the strong."

Sanitary Reform.

But if I have not identified myself with this Association to the extent I feel I ought to have done, since my election as a member some twenty years ago, I hope I have not the less continued to take a deep interest in all matters relating to our profession generally, and perhaps if one question more than another has exercised my mind it has been that of sanitary reform. I feel sure that every member of our profession must congratulate himself upon the rapid strides which have—say, during the last ten years—been made in this direction; but, however much has been done, more remains to be executed, and we must not adopt a "rest-and-be-thankful" policy. Engineers, architects, medical practitioners, and enterprising manufacturers of sanitary appliances have done a good share of this good work, and the public is fully alive to the fact that what is now wanted is some energetic and determined action on the part of local authorities—more particularly those of large manufacturing towns—with regard to the consumption or abatement of smoke. For, let the engineer or the architect lay down his miles of well-constructed sewers or perfectly-trapped drains, who shall presume to say a town is in a thoroughly sanitary condition, where thousands of coal-fire chimneys are belching forth their volumes of poisonous black vapour, polluting the atmosphere and destroying almost every breath of fresh air, to say nothing of the injury and disfigurement to our architecture? Surely in this scientific age something could be devised to alter the present state of affairs. Many of us no doubt looked forward with interest some two or three years ago to the results likely to be obtained from the exhibition of smoke-preventing or smoke-abatement appliances at South Kensington, but our hopes have been to a great extent disappointed.

Decline of Stucco.

To turn to another subject, I think it must be a source of much gratification to all of us to see how the long reign of stucco—particularly in London and its suburbs—is fast disappearing before the triumphal advance of terra-cotta. I cannot, however, say that I have very great sympathy with the introduction of terra-cotta in localities like our own, favoured as we are by being surrounded with quarries of some of the best building stones in the kingdom. But in certain districts where stone for dressings is scarcely procurable, or only so at a great cost, terra-cotta is no doubt a great boon, and the more we introduce into our designs good and honest material, such as terra-cotta, instead of the many shams which I regret to say are not yet quite annihilated, the higher will become the standard of our nineteenth-century architecture.

Advance of Terra-cotta.

Now, I think, I may venture to say that no one has done so much for the advancement of terra-cotta in the present day as Mr. Alfred Waterhouse. His Natural History Museum at South Kensington is, I think we must all admit, a most perfect success, and has done more to call forth the potter's art, and the thoughts and abilities of other art workmen, than any other building of the age; and there is every evidence of this material becoming extensively employed, not only in the form of dressings and enrichments, but in ashlar-shaped blocks for walling. The Constitutional Club, Northumberland Avenue, is an instance of this, and I think the result on the whole is satisfactory; and I ascertained when at Birmingham the other day, that in spite of the strong protests made by masons and others against the use of terra-cotta for the new Assize Courts there, that material will nevertheless be used as proposed. Now, what would be the feelings of that master craftsman and great potter, good Master Josiah Wedgwood, could he revisit this earth and see such a building as the Natural History Museum? Would he not think of the time when architects scouted his suggestions for the introduction of raised ornamentation in their façades and other enrichments of their buildings? It is always somewhat surprising to us, when we witness such happy achievements as that at South Kensington, that it has been so long in being brought about, particularly when we remember that all over the Italian Peninsula during the Mediæval period, burnt clay of a decorative character was in free and frequent use in architecture. But we need not go to the Continent for early examples. Burnt clay ornamentation—especially in chimney-stacks—is with much effect employed at Thornbury Castle, Gloucestershire, Eton College, and Hampton Court. I may also mention that the chimney-stacks of many of the old Sussex homesteads are interesting examples. This subject of terra-cotta reminds me of another blow poor old stucco has recently received, I allude to the rage for brick buildings, induced, I conceive, by the introduction of the style generally termed—but I am afraid not always recognised as—"Queen Anne." But I think it is quite a question with us, situated, as I have already said, in the midst of a stone country, how far we are justified in encouraging a taste for brick buildings. I remember some years ago many architects were strong in advocating the use of local materials, viz., bricks in the clay districts, stone in the stone districts, and wood in the woodlands; and I recollect a facetious correspondent in one of the professional journals remarking that "to carry out the extreme principle, it would compel us to build our ships of oyster-shells and fish-bones."

Architectural Federation.

To go to another subject: I presume that on an occasion like the present I shall be expected to allude to the subject of architectural federation. Now I fully approve of the principle of federation, and I believe if some satisfactory scheme can be devised it would prove of immense advantage to our profession and the public; but I do not think some of the chief promoters of the scheme have as yet realised the difficulties which will be found in dealing with its details. Although a member of the Architectural Federation Committee, of which Mr. Edgar Farman is honorary secretary, I have refused to sign the form of declaration which proposes to admit into our ranks as architects local board surveyors and land surveyors. The framers of this document might have gone a little further and included inspectors of nuisances. Unfortunately, our profession is at present one in which any man—no matter how ignorant or how unqualified—can enter, his diploma consisting simply of his door-plate, and his qualification the impudence with which he dubs himself "architect"; and I for one will therefore welcome most cordially any scheme of federation which is likely to bring about a better state of things, and I believe that the true and proper solution of the difficulty—a solution in which the interests of the profession and the status of its members will be best taken care of—will result from the labours of the R.I.B.A.

Federation Committee, upon which I have the honour of representing you.

Advice to Students.

Now, I believe that something like 25 per cent. of the members of this Association consists of students, some of whom no doubt are on the threshold of a noble profession, and to these the remainder of my remarks will be more particularly addressed. I often think of the immense advantages which pupils in London have over their provincial brethren; the facilities for attending the architectural school of the Royal Academy, the British Museum with its wonderful library, courses of lectures at other institutions, and other benefits which, if wisely used, are of the greatest value; but then, on the other hand there are temptations in London to divert the mind from its proper channel, which do not—to the same extent at least—exist in the provinces. Now, what I want the student or the pupil of the present day to do is this. If the fates are against his being made an artistic architect, let him endeavour to help us to make him a practical one. Or, if you take exception to the word "practical"—which I must confess is somewhat hackneyed and frequently misapplied—let us say a scientific architect; and I say "help us" because so much depends upon himself. Let him at once face the truth, and recognise the fact, that unless he takes some special means of study on his own account that he may acquire an amount of knowledge beyond that which he gains in the office, he cannot hope to succeed. If he closes his mind with the office door, he will never attain to proficiency. I will yield to no one in making a liberal allowance for what I may term "unbroken colts." I can feel for the quondam schoolboy who has to put aside, to some extent, his cricket, or his football, and other games so dear to English lads; but he must be reminded that without diligence, or a proper course of professional study—which I am sure, both for our sakes and his own, we are at all times willing and anxious to direct—he will assuredly be worsted in life's battle, and become, not only a reproach to himself, but a disappointment to his friends.

Self-Culture.

Self-culture is always most permanent and the best, and it is particularly so in our profession. It is impossible for the young architect to acquire in an office much more than the requisite technical skill. His own exertions must do the rest, and he should remember that

> He that by the plough must thrive,
> Himself must either hold or drive.

Such associations as ours ought to be most valuable adjuncts to architectural education, and I would urge upon the younger members the importance of their favouring us with papers, and they may depend upon it that the party most benefited by a paper is the individual who writes it, and here let me say that I consider it a mistake to always select a subject you are most familiar with; it would be better sometimes to take a subject you are practically ignorant of, but at the same time desirous of acquiring a thorough acquaintance with. Then set to work systematically about obtaining all the information you can with regard to it, and I can assure you, before your paper is concluded the knowledge you have acquired will be so fixed upon your memory as to be always at your service when called upon.

Talking and Tact.

But these papers should be well discussed as well as written, in which the younger members should take an active part, for I am sure they would afterwards find such discussions to be of the greatest benefit to them, if they tend to do no more than make them "speak out;" because, in the course of business, an architect is frequently called upon to explain some matter or other to a body of men—say a town council, a committee, or even a public meeting, and the young architect would find on such occasions that open discussion had done much to facilitate his expressing himself clearly and to the point at issue. It is, to a great extent, a matter of practice, and ought to be persevered in. I know several men who can talk well, and sometimes eloquently, to a single hearer, but who are perfectly *hors de combat* when they have to address a dozen persons. And here I wish to say a few words about tact. A man may be clever, original, and commence to practice under the most favourable circumstances, and yet utterly fail for simply the want of tact. In my opinion, no two persons—say architect and client—can have much to do with each other without having much to bear with each other. Hence the necessity of tact; but not, mind you, the tact born of the servility and the sycophancies of a Pecksniff, or the surrendering, on the part of the architect, of what, in his opinion and judgment, is due to his profession and his client's real interests, for the purpose of pleasing his client by letting him have his own way, and for which, likely enough, he would ultimately blame you. I have found from experience that to obtain your way in what you believe to be the right course requires delicacy of touch, patience, power of sympathising with the prejudices of others, and, above all, a genial persuasiveness. For, as with a private client, so with a committee or any other body of men, he or they may be guided, or even persuaded, but will not be driven.

The Love of Art.

For some years now the love of art has been spreading, and its advancement would have been greater had not the depression in trade of late years somewhat arrested its progress; but if we are to judge from commercial statistics and other sources, there is already a rift in the cloud displaying a patch of blue sky and sunshine. I believe the tide has turned, or at least the ebb has reached its limit. Now, if this be so, a revival in trade means a revival and progress in art, and the skill of the architect will be more and more in request. It rests with yourselves what use you will make of your opportunities; certain circumstances will no doubt have their influence on certain men, and as "one star differeth from another in glory," one man may have to accept an engagement as draughtsman as soon as articles have expired, another may become a quantity surveyor, a third—seeing the struggle for an art man without a connection—may go in for arbitrations, dilapidations, light and air, and compensation cases. But it is in the power of all—directly or indirectly—to do something for the advancement of our future art and architecture.

Artistic Education.

It is scarcely within the compass of an address like this to deal with a subject of so wide a range as that of the artistic education of an architect. At the same time, I should like to say a few words upon it, and one of my reasons for referring to the subject is that it leads up to the question of what is likely to be the careers of our own sons who are likely to succeed us in our practice, and the sons of others whose professional education has been entrusted to us. I remember, when I was a very much younger man, and without what are generally understood to be encumbrances, reading a paper by Mr. (afterwards Sir) G. G. Scott, in which he said, speaking of the artistic education of an architect:—"I am quite unable to point out to my pupils, or my own sons, any means of obtaining a true artistic training but the most irregular and accidental." Well, I can assure you that I felt very much amazed at this; it seemed to me almost past belief. But experience comes to all of us if we live long enough; and now that I have been in practice for more than twenty years, having had several pupils through my hands, and my own son in my office, I can fully endorse those words, which, coming as they did from such a man, seemed so perfectly incomprehensible to me when I read them. These remarks, however, apply strictly to the artistic education of architects, and it appears to me—alluding very briefly to the subject—that the only way to acquire it is to remember that all fine art in architecture lies in the artistic treatment and perfection of the work when carried into execution, and the only way of attempting to accomplish this is to travel, for the man who is always seeing is always learning. Visit, sketch, and measure the best examples of ancient work, draw from the human figure, study animal life, natural foliage and botanical productions, treating them directly or in conventional forms; then come the true principles of colour, and its application to architectural decoration.

Surveyors and Arbitrators.

But still the world must have its quantity surveyors and experts in arbitration, light and air, and compensation cases. The world could not do without them, and, perhaps, they do the most useful, as well as—I am sure in some instances—the most lucrative part of the profession. And, *apropos* of compensation cases, I would just remark that if a man has not the ability or opportunity of becoming an artist, it is simply an application of the great law of compensation which rules that one man shall not have everything. This being so, we should all mutually assist each other in the great object we all, I trust, have at heart, viz., the advancement of our profession, remembering that in all ages the architecture of a country has testified more than anything else to that country's greatness.

A vote of thanks to the President was proposed by Mr. W. H. Dunn, and unanimously adopted.

ROYAL ARCHÆOLOGICAL INSTITUTE.

THE monthly meeting of the above Society was held on Thursday, in last week, at the rooms in Oxford Mansion, Oxford Street. The chair was taken by Mr. J. T. Micklethwaite, F.S.A., in the absence of Lord Percy, the president of the Institute. An interesting collection of Egyptian antiquities was exhibited and laid on the table by Mr. W. Flinders Petrie, who also read a paper on the city of Daphnæ, in Egypt, where he had made some important excavations during the past twelvemonth, under, at all events, one favourable condition, namely, the fact that the ancient history of that city

extended over only just a century (B.C. 666-566). Most of the treasures which he exhibited were discovered in the palace of King Psammetichus. This was followed by a thoughtful paper by Mr. Arthur Baker on the vexed question of "Architecture *v.* Archæology," and which of the two ought to prevail in the case of the restoration of parish churches; and he suggested, as a solution of it, that a board of examiners should be appointed by the Archæological Institute, jointly with the Institute of British Architects, with power to grant certificates of competency to persons desirous of being employed in church restoration. The reading of this paper was followed by a discussion. Among the other articles exhibited was an object lately dug up at Rotherhithe, supposed to be an ancient Roman amphora; but Mr. Flinders Petrie showed reasons for thinking that it was a piece of Egyptian ware of much more recent date. A letter was read from the Rev. Joseph Hirst, dated from Smyrna, October 25, in which he states that the Turkish Government has withdrawn all permissions given to Englishmen and other foreigners to excavate ancient sites within the Sultan's dominions, and also that large quantities of finely sculptured pillars, walls, and stones are being sold and utilised for modern building purposes; and a motion was carried that the Institute should take action, along with other learned societies, in protesting against this act of vandalism.

THE CAMBRIDGE UNIVERSITY LIBRARY.

THE Library Syndicate of Cambridge University have issued a report on the extension of the library building, a work urgently required. Mr. Pearson, R.A., will be the architect. His plans provide for the completion of the western quadrangle of the library, the western side of which is at present unoccupied, except by the beautiful but incomplete fragment known as the "old gateway." This gateway, which led into the old court of King's College, is a building of Henry VI.'s reign, and one of the most beautiful pieces of architecture in Cambridge. It is proposed to preserve and complete the gateway tower, and to fill the spaces on either side of it, between Cockerell's building to the north and Scott's building to the south, with erections three storeys high. On the south side of the gateway will be a safe-room, provided with fireproof walls and doors, for the manuscripts and most valuable books. The attention of the architect has been specially directed to safety from fire, economy of space, and the avoiding of dark corners. It is believed that while attending to these points Mr. Pearson has produced a convenient plan, and an elevation the architectural features of which are interesting and in harmony with those of the old gateway. It is estimated that the building will cost about 13,500*l.*, and the Syndicate recommend that the work shall all be carried out at once. Another proposal of the Syndicate is to accept the valuable collection of Chinese books offered by Sir Thomas Wade, and to confer upon the donor the honorary office of keeper of these books, with certain privileges. They also announced another important gift in the shape of a large collection of Sanscrit manuscript from Nepaul, made by Mr. Bendall, of Caius.

THE SURVEYORS' INSTITUTION.

ON Monday Mr. W. J. Beadel, M.P., the president of the Surveyors' Institution, delivered the opening address of the session. Mr. Beadel dealt mainly with the past and proposed legislation with regard to land. At the present moment there was a wide-spread indisposition to invest money in land. To show the altered state of things, it appeared that in 1875, 95,894 acres of agricultural land were disposed of, the purchase money being 4,969,783*l.*, or at the rate of 52*l.* an acre, while in 1885, 31,070 acres only were disposed of for 986,253*l.*, or an average of 32*l.* an acre—in round figures less than one-third of the quantity, one-fifth of the total amount in money, and a reduction in the acreage price of 40 per cent. In City properties values (warehouses somewhat overbuilt excluded) had been fairly maintained. In the suburbs houses and land had been depreciated partly by overbuilding and partly by reduced spending power. The quinquennial valuation of the metropolis under the Act of 1869 having been completed, the result was a rateable value of about 30½ millions, showing an increase of about one million and a half during the last as against an increase of nearly three millions in the previous five years, while the present small increase appeared to have been chiefly made up by an extra charge upon railways and other public undertakings. The suggested increase in land-tax and other charges upon land, instead of proving a national advantage, would further paralyse the agricultural interest of the country. It might fairly be urged that some of the existing charges should be transferred to personal property. With regard to the allotment system, if sufficient land were given to occupy a working man's whole time his labour would probably prove unremunerative, but allotments near towns would be of immense benefit to the artisan class in affording recreation to them. As to the remedy for agricultural depression, Mr. Beadel said that wheat-growing was the backbone of English farming, and, as foreign competition had led to the present state of things, he advocated legislation which would allow them to grow the largest quantity of wheat in this country, and so become dependent upon extraneous sources for a minimum rather than for all we require.

Correspondence

The New Charter of the Institute.

SIR,—As the Society of Architects has published a protest against the principle of the new Charter which the Institute has petitioned the Queen to grant, perhaps it has not yet been sanctioned. If so, it is not too late for a word or two on behalf of a body almost as much interested in its terms as architects themselves, namely, the public.

Is it, then, really necessary that all architects (whether members of the Institute or not) should be bound by regulations in the framing of which they have had no voice? Is it in the interest of the general public that a man shall be prevented from practising as an architect, however competent he may be, because he prefers freedom to the checks of a society whose rules he may not in all respects approve? It is certain that the Institute and its Charter are unnecessary to the attainment of the highest rank in the practice of architecture, as there are men equally distinguished who are and who are not members.

The Charter of "the Institute" and the proposed Registration Act of "the Society" are framed in the interest of the profession, which it can scarcely be maintained is invariably that of the general public. We know that disputes between architects and their clients do occasionally arise, and that when the former propose to refer the matter to the Council of the Institute, the latter often object on the ground of its being a one-sided tribunal. This is obviously natural enough, because laymen—as representing the public—have had nothing to do with framing the Charter or its by-laws. And in the present proceedings, the lawyers constituting the Judicial Committee can scarcely be accepted as representing the general public, unless they are in some way requested to do so.

This, I am inclined to think, ought to be done before the new Charter is granted. It is in every way desirable that the public should—if possible—have full confidence in the regulations by which architects who are members of the Institute are governed, but it can only possess this confidence by knowing that it has been represented when those regulations were framed.

Would it not, then, be well for the Judicial Committee to examine a few laymen as to the merits of the new Charter from the point of view of the public—laymen who have been connected with more or less important building projects, and know something of the duties, the responsibilities, and the remuneration of architects? If this could be done, I think there can be no doubt that the position of the profession would be improved, and that the public hereafter would probably be quite satisfied to be governed in matters of dispute by the Charter of the Institute.

At the same time, I think the right of men to practice with perfect honour independently of the Institute should be acknowledged in the Charter. Experience has proved that success is quite independent of any advantages the Institute can confer. It should, therefore, be no dishonour not to be a member. I am inclined to think that if the suggestion I have ventured to make were adopted, membership would soon be felt to be so honourable as to be a necessary distinction to every practising architect, and be secured as a matter of course.—Your obedient servant,

DEMOS.

Registration.

SIR,—Allow me to endeavour to show why the proposed scheme of compulsory registration is undesirable and impracticable. If the proposed Bill be brought before Parliament, the promoters will have to answer the following questions:—

"Do all the gentlemen who have signed your petition consider themselves competent to act as architects?"

"Have they all passed through the usual apprenticeship or shown their capacity by passing an examination?"

"If they have not entered the profession in either of these ways, why do they attempt to impose on others that which in their own case they admit to have been unnecessary?"

The application of these questions would certainly put out of court a large proportion of those members who have signed the petition, and convert them, though against their will, into

hostile witnesses. A large number of those practising in the country as architects have raised themselves from much humbler positions. In the future it will be far easier for others to do so. Is it pretended that these gentlemen are not as qualified to deal with the multifarious and puzzling duties of country building as the young architect green from an office, even though he may have successfully passed an examination in the science and art of his profession?

The public will continue to prefer the humbler practitioner for a large department of work, and, with the present facilities for education, he can easily make himself thoroughly competent for such work as should fall to him. It would be an ungenerous action, opposed to all modern ideas, to close to the man of talent the means of raising himself above the station of life in which he is first cast. In these days, any one with practical knowledge of building may readily qualify himself both artistically and scientifically to exercise the humbler branches of architecture, and it is quite certain that the public would not for a moment tolerate any restrictive action.

What does seem to be needed is that the public should have some means of knowing the relative status of architects; that it should be able to tell at a glance that the man who is well qualified to superintend repairs, or to erect farm-buildings, shops, cottages, mills, and villas of the humbler sort, has not had the education likely to qualify him for the design of more important dwelling-houses, churches, or buildings requiring scientific knowledge. He may possibly be well qualified for all these, and there can never be anything to prevent the public from employing him if they choose, but we have to see that they do so with their eyes open.

The name of architect has been used freely for centuries, and it is quite useless to expect that Parliament will sanction its restriction. It remains, therefore, for those who wish for registration to adopt a new name that they can keep to themselves. That is a very unpromising idea, and the result can, I think, be attained another way.

The Institute, by requiring a certain course of professional action, and insisting on a competent education, offers the public a guarantee that all members of its body are fit and proper persons to practice as architects. It is open to the Society of Architects, whose conditions of membership are apparently less strict, to offer a similar guarantee, and it is open for any number of similar societies to do the same. The point is then to get the public to recognise the value of these guarantees.

Putting occasional exceptions out of view, there is only one safe way of getting anything from anybody, and that is to offer them a fair exchange for it. If these societies wish to obtain any substantial recognition from the public they must be prepared not only to look after their own interests but after those of the public, and they must act and not be content with talking. Whatever society does most for the public will get most respect paid to it, and will swallow up the others. I venture to say it lies in our own hands, without the intervention of Parliament, to create a position for ourselves quite equal to any to be created by an artificial system of registration.—I am, Sir, faithfully yours,

RALPH NEVILL.

November 10.

CHURCH BUILDING AND RESTORATION.

Bongate, Appleby.—St. Michael's Church, Bongate, which has just been restored, has been reopened. Mr. C. J. Ferguson, Carlisle, was the architect, and the following were the contractors:—Stonework, Mr. George Robinson, Appleby; woodwork, Messrs. Slinger & Gowling, Appleby; plumbers, Messrs. Thomson, Carlisle; painter and glazier, Mr. Palmer, Carlisle; slater and plasterer, Mr. G. Potts, Appleby; clerk of works, Mr. William Harrison, Bongate.

Winthorpe.—The foundation-stone of a new church has been laid at Winthorpe, near Newark. The architect is Mr. S. Gambier Parry, of London, and the builders are Messrs. Mackenzie & Son, Newark, Mr. J. Handley being clerk of works.

Eppleton, Hetton Downs.—The foundation-stone of the new church of All Saints has been laid. Mr. R. J. Johnson, of Newcastle, is the architect; Mr. Robert Boyd, of Gleasby, Darlington, the contractor; and Mr. T. Adamson, of Sunderland, clerk of works.

Penarth.—The memorial-stones of a Presbyterian chapel, which is now being rebuilt, were laid on the 1st inst. The building is in a free treatment of Romanesque, and is being carried out from the designs and under the supervision of Mr. J. H. Phillips, architect, Duke Street, Cardiff. Accommodation is provided for about 380, and the cost will be about 800*l.*

Bo'ness.—The memorial-stone of a new parish church has been laid. The architects are Messrs. Thorton & Shiells, of Edinburgh. The contracts are being carried out by the following tradesmen, viz.:—Mason work, Mr. Russell, Bo'ness; joiner work, Mr. Smith, Stirling; pulpit and chancel, Mr. Smith, Stirling; plaster work, Mr. Ferguson, Bo'ness; slater work, Mr. Kilpatrick, Bo'ness; plumber work, Mr. Hodge, Bo'ness; glazier work, Mr. O'May, Falkirk; heating, Messrs. Robinson & Son, Edinburgh; painter work, Mr. Craig, Bo'ness; gas and fittings, Messrs. Laidlaw & Sons, Edinburgh; ironwork, Messrs. Morrison & Co., Bo'ness.

GENERAL.

A Picture, *The Pass of Leny*, by Mr. John Smart, R.S.A., in Dundee Fine Art Exhibition, has been purchased by Mr. J. G. Orchar, and presented to the permanent collection. This is the seventh picture Mr. Orchar has presented to the Dundee Picture Gallery.

Mr. Phipps, F.S.A., and Mr. Hollingshead have been making an inspection of theatres in Germany, with a view, it is said, of erecting two new buildings in London.

Mr. W. Agnew, chairman of the Fine Arts Section of the Manchester Jubilee Exhibition, has intimated that the members of the Manchester Academy will be requested individually to send a representative work to the forthcoming exhibition at Old Trafford.

The Exhibition of the Aberdeen Artists' Society closes to-morrow (Saturday). Little public interest has comparatively been taken in it except by the working-classes.

A Portrait of Mr. Philip Horsman is proposed to be placed in the Wolverhampton Art Gallery as a memorial of his gift of that institution to the town.

The Liverpool Exhibition, which has just closed, has been visited by 2,682,516 persons since the opening on May 11.

The Birmingham Art Gallery Committee report that 178,282 persons, a daily average of 696, have visited the gallery during the past twelve months, that no fewer than twenty-six pictures have been presented during that time, and that no damage has been done to any of the works of art.

Mr. Fowler, the architect, has been elected Mayor of Louth for the year of office just beginning.

Mr. R. Horsfall, architect, has been re-elected Mayor of Halifax.

Mr. R. W. Moore, at the meeting of the Leeds Architectural Society on Monday, read a paper on "Reminiscences of Old Edinburgh."

A Paper on "Towers and Spires" was read by Mr. M'Nab, the president, at the meeting of the Glasgow Architectural Association last week.

The Jubilee Year is proposed to be marked in Denbighshire by rebuilding on Moel Fammau, one of the highest mountains in the Vale of Clwyd, the tower which was erected in commemoration of the Jubilee Year of George III., and which collapsed in 1862.

Mr. J. F. Kempson, architect, of Hereford, has been elected Surveyor of Ecclesiastical Dilapidations for the Diocese of Llandaff, in succession to the late Mr. Prichard.

Mr. T. Lewis, the Mayor of Bangor, intends to present a tower and clock to the city of Bangor during this his second year of office.

The Public Baths at Richmond, Surrey, have been nearly destroyed by fire, the large swimming baths fortunately escaping injury.

Messrs. Blaikie Bros., engineers and ironfounders, Footdee, Aberdeen, have just entered into a contract with the Great North of Scotland and Highland Railway Companies to erect a steel over-bridge across the railway in the vicinity of Elgin stations.

Mr. E. J. Osborn, Upper Holloway, London, was on Wednesday appointed clerk of works to the new infirmary which is in course of erection at Birmingham. The salary is 6*l.* per week, and there were 141 applicants.

Mr. D. Wood, manufacturer of Glossop, has offered to build and endow a hospital for the town at a cost of 25,000*l.*; Mr. S. Wood to construct and endow public baths; and Mr. Partington has added 2,000*l.* to a like sum given by Mr. Rhodes towards a free library and town-hall.

Mr. John Sleddall is about to build and endow twelve almshouses for decayed tradesmen at Kendal. The houses will be erected from the designs of Mr. Eli Cox.

Miss Eason, of Gurdon, has given 1,000*l.* and a site for a new church in Parkgate, Darlington.

The Aston Board of Guardians have selected plans for the erection of a new block of imbecile wards, and other works. Several Birmingham architects were invited to submit plans in competition for the work. The Guardians, in consultation with Messrs. Henley and Jenner Fust, Local Government Board inspectors, have adjudicated upon the plans submitted, and selected those of Messrs. John G. Dunn & F. W. Hipkiss, of Waterloo Street, who have been appointed architects.

The Architect.

THE WEEK.

When writing, on October 8, about the election of a supervising architect, we remarked from what we saw of Mr. Vulliamy that he was running a risk to himself in agreeing to hold office. It must have been evident to any careful observer that Mr. Vulliamy could not undergo the fatigue of his post during many months. We regret to find that our prognostics were verified. At the meeting of the Metropolitan Board on Friday last the announcement was made that Mr. Vulliamy was no more. One member said that it was evident a few days before that Mr. Vulliamy's constitution was giving way; but so much might be observed a month earlier. During the twenty-six years which Mr. Vulliamy held his most difficult office he discharged the duties in an honourable and equitable way. His decisions might not always give equal satisfaction to all parties, for that would be an impossibility; but we never heard of a case in which anyone impugned his honesty. He often sided with architects against district surveyors, and it is rather surprising that at the meeting on Monday testimony to Mr. Vulliamy's good qualities was not borne by some member of the Institute who was not an official under the Building Act. To most architects he was known simply as supervising architect or surveyor, but he was so able a designer and draughtsman as to merit recognition among the artists of the profession. The proposition of Mr. Smith that an exhibition of Mr. Vulliamy's works should be held in Conduit Street did not appear to be accepted by the authorities of the Institute, but it is to be hoped that no obstacle will be raised to such an exhibition. It is not much of a tribute to offer to the memory of a man who was so closely connected with the architects and architecture of London. Mr. Vulliamy was buried in the churchyard of Stone, near Greenhithe, on Wednesday.

Mr. George T. Doo, who died at Sutton, on Saturday, was, we believe, the last of the old line engravers. He was born in January 1800. He was first brought into notice by his engraving after Lawrence's *Duke of York*, in 1824. Afterwards he studied abroad, and on his return set up an antique and life academy in the Savoy. Mr. Doo was one of the nine engravers who, in 1826, presented a petition to the House of Commons praying that an investigation might be made into the state of engraving in England, as neither the art itself nor its professors derived adequate consideration, encouragement and respect from the institutions of the country. In 1836 he was appointed engraver to William IV., and in the following year he was the representative of the historical and landscape engravers who presented a petition to the King on the position of engravers in the Royal Academy, which was said to be humiliating. What was sought was the assigning to the most skilful engravers "the same honourable rank that is bestowed on those of every other branch of fine art." Lord John Russell, who was Secretary of State, in reply, wrote to Mr. Doo saying he must decline recommending His Majesty to accede to the petition. A similar petition was presented in 1812 with the same result. Although Mr. Doo was appointed engraver to His Majesty in 1842, he was not elected an Associate until 1855. Among the best known of his engravings are those after Wilkie's *Knox Preaching before Mary Queen of Scots*, Eastlake's *Pilgrims in Sight of Rome*, Correggio's *Ecce Homo*, Etty's *Woman interceding for the Vanquished*, Reynolds's *Exiled Noblemen*, Vandyke's *Gervatius*, and several portraits after Lawrence. He joined the Artists' Annuity Fund in 1825, and was elected President in 1825. Mr. Doo was elected an Academician in 1856, and for a long time has been on the retired list.

It is wonderful how interesting and important a building is discovered to be when it is on the eve of destruction. There is no great love for old buildings in England, for many of the best have been allowed to fall into a decay that is dangerous to their existence. But as soon as there is a project to utilise one of the sites for another purpose, behold a sudden uprising of an army of enthusiasts for the preservation of the building. As a rule, the defenders of antiquity will only talk; they leave the privilege of paying to others. Hitherto Staples Inn, in Holborn, was neglected. The governing body, therefore, thought they were safe in selling their property, and, according to rumour, they received 80,000*l.* from Messrs. Trollope for it. Now, Staples Inn would seem to have been the idol of London. Of course, the Royal Institute of British Architects must make a show of taking an interest in the place. The President is, however, a man of business, and does not commit himself to anything definite either for or against the transaction. "We feel it incumbent on us," he says, "to call public attention to the contemplated removal of any interesting record of the past, so that those who have the power or the means may, at least, be made aware of their value, and may thereby be induced to appreciate the desirability of maintaining those works of artistic historic value, the preservation of which adds so largely to the interest of our great city." It is evident from the cautious letter that the President feels that nobody cares about the valuation of the Institute, and indeed if the interest of a work is not self-evident, there is little chance of its preservation. The Commons Preservation Society approach the City Council, which is supposed to have an exchequer that is unlimited, and suggest that it is "peculiarly the function of the Corporation to preserve all that is ancient and venerable within the City." If that were correct, then many recent buildings are illegal. Knowing the alleged propensities of citizens to indulge in the pleasures of the table, it is said that the "hall of the Inn is excellently adapted for banqueting purposes." The Corporation are not to be caught by blandishments under that form. The existing Staples Inn is not of great age, and has no historic importance. The hall is the most interesting part of the property, but it is hardly worth preserving at the price of 80,000*l.*, for unless the whole site is turned to account, a profitable arrangement of the property is impossible.

Among the statuary in this year's Salon was a great figure of Vercingétorix, representing the young warrior at the time when the Gauls had made him their chief. It was the work of M. J. J. François Mouly. He had already received an honourable mention for one of his statues, and he anticipated this year that one of the medals must be awarded to him. Like so many sculptors, M. Mouly was a poor man, and it was with the greatest difficulty he raised money to pay for the models and the plaster for his figure. But his hope was in the Salon. If the figure brought him a medal he was sure to receive a commission, and all would then go well. He was married, and had five children, for whom bread had to be found. His figure was not thought worthy of more than a mention, and there was no order given for its execution. Indeed, there is, of late, a superabundance of figures of Vercingétorix, and the public authorities may be excused for passing over another. His *département*, also, was not tempted. The disappointment brought the unhappy artist to a state of insanity. His wife carried him away to some relatives near Bordeaux, in the hope that a change might be curative. First, he tried to kill his wife, and then he attempted to throw himself under a locomotive. It was decided to place M. Mouly in an asylum, but he contrived to escape from his keepers, and killed himself at the roadside. He had not reached his fortieth year.

The interim reports on the South Kensington Exhibition will disappoint people who anticipated a surplus which could be applied to some useful purpose. It is not yet certain whether the guarantors may not have to make up for a deficit. The Committee say they are confident that no claim will be made on the guarantors, but there is something ominous to them in the statement that "many of the objects purchased by the Royal Commission in India have yet to be disposed of." Suppose purchasers are not forthcoming, what is to be done? The Inventions produced a loss of 5,437*l.*, and all that remains of the surplus of the Health Exhibition is about 3,000*l.* What seems most amazing is the item for buildings. Under that head we find 44,238*l.* for the Fisheries, and 47,045*l.* for the Health Exhibition. The cost for the succeeding Exhibitions is not given. It is evident that flimsy sheds are an expensive form of structure.

RICHARD WAGNER.*—II.

IT will be asked, What brought WAGNER to Paris when he first went there in 1839? He was a German of an almost ideal type, and, as he was twenty-six, he was old enough to know that he must be out of place in the French capital. But he was one of those men over whom Paris exerts fascination. Whenever he went there he was rejected, and suffered keenly, yet he was always ready to repeat his visits. For him the city was the *belle dame sans merci*, and he continued to be as much in thrall as any Mediæval knight to the enchantress. He made a roundabout journey to Paris by way of London, and we cannot understand why he did not remain with us if he wished to have an exile's experience. Opera flourished in London in 1839. A band of speculators who took Her Majesty's Theatre cleared 10,000*l.* in that season, which was memorable by the first appearance of MARIO here. RUBINI, GRISI, LABLACHE, DORUS-GRAS, TAGLIONI, and other opera stars were then shining, and, as regards concerts of an expensive class, London was said to be "concert mad." If WAGNER stayed among us it would have been better for himself and for his art too; but probably he resembled M. GARNIER, the gold medallist, and considered that London was *la ville anti-artistique*.

At Boulogne WAGNER met MEYERBEER, who gave him letters of introduction to a manager and a firm of publishers in Paris. HENRI HEINE, when he heard of the auspices under which the composer landed, said he was distrustful of WAGNER because of the man who had recommended him. Afterwards the poet was a little more sympathetic. WAGNER was throughout his life regardless of economy, and it was probably at his wife's suggestion when he engaged lodgings in one of the back streets of Paris near the Halles. At first everything seemed propitious. His "Novice of Palermo" was accepted at the Renaissance, and an overture for the Conservatoire. It was found, however, that the executants could not make head or tail of the overture and declined to play it, and, as ill-luck rarely comes alone, the lessee of the Renaissance became a bankrupt. Fortunately for WAGNER he was able to write articles in the *Gazette Musicale*, and for a time contrived to keep himself alive. He also transposed one of DONIZETTA's operas for the piano; he composed airs for French songs at prices varying from 12 frs. to 22 frs., and was willing to do any journeyman's work of a musical kind. He was invited to supply the music for a vaudeville, but actors and actresses rebelled when they heard what they were expected to sing. He tried to get humble employment as a chorus singer, but was found incompetent. His "Columbus" overture was sent over to London to M. JULLIEN, but the ringletted conductor did not consider it to be suitable for his promenade concerts. He returned the manuscript, but did not pay carriage. WAGNER was not possessed of the small sum that was due, and in consequence the overture was taken back by the carriers and was henceforth as much lost to the world as the comedies of MENANDER. People often say that Paris is a kindlier place than London for a man of genius when he is needy, but in spite of his industry WAGNER must have starved if a few of his humble countrymen, who resided in the city, had not come to his rescue. It is not surprising that he wrote and said harsh things of contemporary musicians who were successful, or that he considered LISZT, who was to be his doughtiest champion, as a charlatan. He made an exception in favour of BERLIOZ, who also was disregarded as a composer by the public. In spite of his misery, WAGNER could become enraptured in those days when he was permitted to hear a symphony by BEETHOVEN or WEBER's "Freischütz." We have an anticipation of his revival of so many of the oldest legends when we find him saying, after hearing that opera, "How I must love the Germans who still believe in legendary marvels, and who, as men, continue to be agitated by the terrors of childhood." He took heart, for the success of WEBER appeared to be the triumph of Germanism.

WAGNER's "Rienzi," which he brought with him incomplete, may be said to have resembled the ordinary Italian grand opera. In his misery in Paris and enforced idleness, he could hardly fail to reflect often on problems of music and of life, and in what he wrote at the time one can discern that a change was being wrought within him. He imagines BEETHOVEN as saying that the sounds of instruments pre-existed in the primitive world as the organs of nature, while the human voice is a direct interpreter of the human heart and of our abstract and individual sensations. The words give us a clue to much that is to be found in the later operas. When the singers' voices are overwhelmed by the force of the instrumentation, we have the struggle of Man with Nature, of Man with Fate. Instrumentation is no longer a subservient accompaniment to support the singer, but a rival force, and which often seems to be the conqueror.

MEYERBEER appears to have been absent during the time when WAGNER was suffering. When he returned to Paris he introduced him to the director of the opera. Whether WAGNER proposed the unfinished "Rienzi" we cannot tell. All we know is that he offered to submit the sketch of a new opera. What he had in his mind was the story of the "Flying Dutchman." Some of our readers who are no longer young, and who were playgoers in their youth, may be able to recall FITZBALL's "Vanderdecken," if they have seen the incomparable T. P. COOKE or one of his imitators in the principal character. The weird drama impressed HEINE, and he retold the story in his most charming style. On application he gave permission to WAGNER to dramatise his version. WAGNER was an able playwright, and his libretto was so captivating that the director offered to purchase it in order to get somebody else to write music for it. WAGNER was overwhelmed by the disappointment, but his needs were so pressing that he was compelled to accept the offer. He received 500 frs.

After this he abandoned the hope of finding any success in Paris, and turned his thoughts homewards to Germany. "Rienzi" was completed with a view to its performance in Dresden, and through MEYERBEER's interest it was accepted for that theatre. But in order to visit Dresden it was necessary to pay for conveyance, and WAGNER was compelled to produce several transcriptions for the piano of other men's works in order to gain a few pounds for travelling expenses. At last he was enabled to fly from Paris. All he had gained by his three years' sojourn there was the discipline which sorrow gives.

In Dresden he found a capacious opera house which SEMPER had completed not long before. "Rienzi" was produced under WAGNER's direction, and was an unqualified success. But he was not satisfied, since neither story nor music could be called German. He persuaded the management to mount the "Flying Dutchman"—that is his own opera—for the Frenchman's (with WAGNER's libretto) was a signal failure. But the legitimate version at Dresden was not more successful. The opera-goers cared only for something that was pleasing to the eye and ear. Henceforth the composer resolved to satisfy an audience that was fit, if few.

The "Flying Dutchman" was the beginning of the Wagnerian era—although enthusiasts may say it was rather an antecedent of the beginning. It seems to us to show signs of a new influence in the mythic character by which it is so widely separated from old FITZBALL's drama or HEINE's story. To WAGNER the Dutch sailor was only a later type of ULYSSES, the Wandering Jew, and other victims of Destiny; and all were expressions of physical phenomena. What was the influence which gave so unoperatic a spirit to WAGNER's *dramatis personæ*? We imagine that it was to be found in the teaching of SEMPER, who was then in Dresden, and with whom WAGNER could not fail to be associated. SEMPER's theories were exactly of the kind that would impress such a man as WAGNER; they afforded him a ready-made solution to the mysteries of life, and helped him to interpret old legends in a way that was satisfactory to himself. WAGNER was a nineteenth-century representative, from his belief in the omnipotence of scientific laws and the unimportance of the individual (himself, of course, excepted); and in his dramas we see the power of an

* *Richard Wagner: Sa Vie et ses Œuvres.* Par Adolphe Jullien. Ouvrage orné de Quatorze Lithographies originales, par M. Fantin-Latour; de Quinze Portraits de Richard Wagner; de Quatre Eaux-Fortes, et de 120 gravures; Scènes d'Opéras, Caricatures, Scènes d'intérieur, Vues de Théâtres, Pièces autographes, Costumes d'acteurs, &c., &c. Paris: J. Rouam. London: Gilbert Wood & Co.

external force, destiny, or nature that is more inevitable in its effects than the fate which presides over the Greek tragedies. All this has a close resemblance to what Semper maintained. Afterwards Wagner came under another influence not far removed from the first, namely, Schopenhauer's, from whom he acquired the faith that life was only a delusion, separating nothingness from nothingness. Latterly, and it may have been through the influence of Liszt or one of his friends, Wagner recognised that in the legends belonging to Christianity there was something which was neither mythic nor Buddhic, and if years had been granted to him, who knows but the "Parsifal" might have become the forerunner of operas which would be essentially human?

Wagner must be comprehended before he is appreciated, and that is impossible if the ordinary rules of drama and opera are applied to him. We need not discuss whether so much mental exertion is compatible with pleasure. The majority of men and women can find more enjoyment in the woes of Amina and Elvino, considered simply as mortals in the dress of stage peasants, than in the harmonious philosophy of Tristran and Iseult as they take an everlasting farewell before they are absorbed into chaos. Whether at a future time, when Schopenhauer prevails, there will be a different mode of thought we dare not say; but, on the eve of the universal suicide which according to some folks is to be the climax of a cultivated humanity, it will be difficult to find a worthier entertainment than Wagner's opera, in which pessimism is expressed through the medium of flats and sharps and with trombones and kettledrums.

During his residence in Dresden Wagner was productive, and he was able to have new operas produced, although they invariably caused much loss to the treasury. It was said that every new opera sent the publisher to a higher floor in the building which he occupied, and if the composer remained in Dresden the publishing office must have been above the roof. Wagner did not confine his attention to his own operas. He produced Mozart's "Don Juan," reading the score in a manner which gave great dissatisfaction to amateurs. He had a sort of triumphal performance of the "Vestal" to give honour to Spontini, but the old maestro did not recognise Wagner as a successor. Weber was another of his heroes; and when the author of the "Freischütz" died in London, Wagner became the leading spirit among those who sought to bring back his body to Germany. There seemed to be no limit to the energy of Wagner while he was director in Dresden.

Wagner could hardly dwell in Dresden for six years without having his head filled with novel notions about other things as well as operas. When the revolutionary year 1848 dawned upon Europe, he was ready to help in creating a new world. Having found that he could do as he liked in Dresden, owing to royal protection, he may have thought that politics were as easy to control as the theatre. "You are a man of genius," said a prima-donna to Wagner, "but you write things so eccentric that they cannot be sung." Somehow they were sung, and as a legislator he might be no less effectual. However, he wished to give a harmonious character to the revolution. He began, therefore, by writing to the King, his patron, advising His Majesty to resign and become first citizen of the republic. His next step was to take a position on the barricades, for which, we believe, Semper was the director-general. The King ran away, and for a time Wagner must have felt that he had discovered a new way to pay old debts; but the Prussians quickly came to the rescue of royalty, and Wagner and Semper forthwith fled from Dresden. Semper found his way to London, while Wagner secured a refuge with Liszt at Weimar. It was soon discovered that he could not be secure there, and Wagner once more took the road to Paris. The Parisians had already more than enough of revolutionists, and Wagner again saw that he was not destined to conquer the city. Like many other representatives of a lost cause, he sought an asylum in Zurich.

In Zurich he found himself among theorists of many kinds, and it was not surprising that Wagner should also lend a hand in explaining how a world that was out of joint was to be set right. He was heavily in debt when he left Dresden, and, as is usual in such cases, we may suppose that some of his creditors were Jews. At Zurich Wagner lost no time in showing that he also had something to say about Jewish influence. His argument was that no Jew could be a musician. He cited Meyerbeer and Mendelssohn as proofs. According to Wagner, they were no more able than others of their race to get beyond the outside of things. A Jew might have senses, affections, passions, and a hooked nose like Wagner; he might have a history of which the facts were more inspiring than the legends of the bards, but on account of his race he could not compose a song. Henri Heine might express the tragedy of the "Flying Dutchman" in words, he might write the most exquisite of lyrics, but beyond that he dare not go; moreover, an adamantine law prohibited any of his race from sounds that corresponded with the words. The Wagnerites and a chosen few who lived a few years earlier were ordained to be the monopolists of the music of the spheres, or the boundless vacuity in which everything is supposed to be annihilated. The sweet singers of Israel were unworthy and incompetent to shout in Wagnerian choruses.

While Wagner was strong in his wrath against Judaism he was invited to conduct the Philharmonic Concerts in London. A notability was indispensable, for the rival society had got hold of Berlioz. He condescended to come, but took care to make everybody feel that he was sacrificing himself. There were traditions of Mendelssohn in the society, and the performers and committee were proud to adhere to them. But then Mendelssohn was a Jew, and Wagner soon made it plain that the quantities in the score were valueless if music was desired. The pieces were not to be taken as written, but as the conductor willed. Whatever may be the faults of Englishmen, they are not ungrateful, and as Mendelssohn showed himself to be friendly towards the Philharmonic Society, it was only right that the committee should adhere to the composer's own interpretation. There was consequently much dissatisfaction with Wagner, but as he possessed the support of the Prince Consort it could not be as freely expressed as it was felt. His plan of conducting the elaborate pieces of Beethoven without a book was also considered to be running risk in order to display the strength of his memory.

At Zurich Wagner was amidst men of genius, but they are not always the best supporters of operas and concerts. Wagner was impelled to make another trial in Paris. He resolved at first to confine himself to concerts. There was, however, much difficulty before he was able to secure a hall. It could not be denied that Wagner had gained a reputation, since his music was the subject of debate throughout a great part of Europe. What decision was to be given by the Parisians who arrogated to themselves the office of arbiters in such matters? At that time everybody took the cue from Berlioz, some directly, the remainder at second-hand. Heretofore he had been rather friendly towards Wagner, but on this occasion he decided against his works, and all Paris echoed his judgment. The concerts were therefore not successful if tested by the receipts.

There was another chance left to Wagner. Through the influence of Madame Metternich, the director of the opera house received a command to mount "Tannhäuser," and under Wagner's superintendence. The composer wished to have Faure for the principal *rôle*, but as he wanted 8,000 francs a month, another performer at 3,000 francs was substituted. A work of the class was novel to singers who were accustomed to the grand operas of France and Italy, and many stormy scenes took place at the rehearsals. But at last the work was ready, and the accessories were in the sumptuous style that was characteristic of the French opera house. To the discredit of Paris, "Tannhäuser" was not allowed a fair trial. The members of the Jockey Club were supposed to have betted against it, and attended in full force, armed with whistles and cat-calls. A scene followed that could only be compared with one of the O.P. riots in London. There was not enough public opinion among opera-goers to insist on justice against a band of pseudo-aristocrats; a few people attended out of curiosity, but from the first the opera was doomed. All Wagner received out of the three performances was 30*l*. It must be recorded with sadness that the downfall of Wagner did not excite any

compassion in the mind of BERLIOZ; he was jubilant at the result.

On the occasion of his first failure in Paris WAGNER found a consolation in returning to Germany. Happily he was able to again take the same route. By the intercession of the Grand Duke of BADEN he was granted freedom from arrest in all parts of Germany, with the exception of the kingdom of Saxony. He returned as poor as when he left, but the hisses of the Parisians had elevated him to the rank of a martyr among his countrymen.

(*To be continued.*)

M. PAUL BERT ON COLOUR.

THE late M. Paul Bert, who died in Hanoi on Thursday in last week, was no less distinguished in science than in politics. Originally he intended to become a civil or military engineer, and he entered the Ecole Polytechnique; but he suddenly changed his mind, studied law, and gained a diploma. However, as he said himself, he criticised laws instead of learning them, and was interested only in Roman and comparative law. Afterwards he was induced to take up physiology, and for five or six years he served M. Claude Bernard as assistant, and afterwards as a deputy at the Sorbonne. In January 1878 M. Bert informed the Académie des Sciences of various experiments he had made in respect to the observation of complementary colours by painters. The following abstract of the paper is found in M. Veron's book on Æsthetics, and will be read with interest, for the death of the Resident-General in Annam is a great loss to France:—

If we observe, from some little distance, the green light resulting from the intermixture of blue and yellow rays—such, for example, as that given by the lamps of a Paris omnibus—we perceive that its colour increases in blueness as its distance becomes greater, and *vice versâ*. If the omnibus be approaching the observer, a moment will arrive when, with a sort of wrench, the real colour becomes suddenly apparent. This result is not, however, absolutely constant; certain conditions seem to be necessary, of which the most important is the presence of a given amount of watery vapour in the air. It will then be readily perceived that of the two colours which compose the green light, blue is the more persistent.

M. Bert seems to have ascertained from other and less careful observations that, in the case of the colour violet, when seen from a distance, the red dominates the blue; again, orange gradually sinks into red. From all this it would seem that the most persistent of colours is red, after which comes blue, and, last of the three, yellow.

We know that there are some painters, and by no means mediocre ones, who make some favourite colour predominate in their works even to exaggeration—with one, it is yellow; with another, violet, &c. It is commonly said of them that they only see yellow or violet. This favourite colour sometimes varies with the succeeding epochs in the life of one and the same painter; so Décamps painted everything lilac in the later years of his life, until people were driven to look on it as the consequence of some physical modification in the sensory apparatus of his eyes.

In order to investigate the bearings of this interesting fact upon physiology, and upon the history of art, M. Paul Bert painted a number of coloured spots, in plain tints, upon a blank canvas. He then got one of his friends, a painter by profession, to copy these spots. But first it was arranged, not only that he should use spectacles of various colours, but, as an additional precaution, the colours were arranged upon the palette by a strange hand, so that the painter, not having his usual arrangement before him, was obliged to examine carefully the composition of the tints which he had to use for his copy.

This experiment confirmed the *à priori* conclusions. The painter seeing through the same glasses both the spots to be copied and the colours upon his palette, committed the same error in his appreciation of the former and his mixture of the latter. Consequently, he was not satisfied with his work until it seemed to be really similar to his model. Looking through the coloured glasses had no other effect than to increase the difficulty of the imitation.

Two exceptions, however, must be made to the latter statements. Suppose the colour of the glasses to be green. If with them the painter examine the various shades of green, he will not appreciate them with his habitual justice; and this is easily to be understood, for they all seem to be more or less bathed in that colour, so that the green tones in the copy suffer. The error, however, becomes still more marked in the case of red. The various shades of this colour, which is the complementary of green, have a tendency to black when looked at through a green light; as a consequence, the compound tints, in which red predominates, become embrowned, lowered in tone, whilst their delicate gradations escape comprehension.

In the case of blue spectacles, it is the shades of blue, and still more of orange, which suffer. To speak generally, the mistakes in the copy mostly arise when the various shades of the same colour as the spectacles, and, in a still greater degree, of its complementary, are in question.

If, then, we suppose the case of a painter, who really sees things with a violet tint, either by his natural disposition or by some alteration in his visual organs, it is not, as is generally believed, by a predominance of violet that his infirmity is recognised, but by insufficient variety and delicacy in the shades of violet and of yellow. If he saw a predominance of red and had to represent a nude figure in a landscape, there would be a disagreeable monotony in his flesh tints, in the gradations of red, which the painter would be unable to distinguish exactly, and above all, in the various shades of green in the landscape.

We may remark in passing, that there is much interest in watching a painter who is copying either nature or a picture after he has made use of a quantity of santonine, a substance which makes everything put on a violet tinge. It is certain, however, that the exaggerated employment of favourite colours by particular painters is caused, not so much by any change in the organs of sight, as by reason of an intellectual kind. The experiments which we have just described show, moreover, how interesting an examination of pictures from this new point of view would be. If there be some who err in their representations of the two classes of tints derived from the complementary colours, we can only attribute such errors in execution to some modification of the organ of sight.

THE EDINBURGH NEW MUNICIPAL BUILDINGS.

IN accordance with a resolution come to a few days ago in the Lord Provost's Committee of the Edinburgh Town Council, the minutes of the sub-committee on the New Municipal Buildings have been published and circulated among the members of the Corporation, with a view to being considered at the meeting on Tuesday. These minutes, which take the form of an interim report by the Lord Provost's Committee, are as follows:—

At Edinburgh, November 12, 1886.—At a meeting of the sub-committee of the Lord Provost's Committee on New Municipal Buildings Bill:—

Present—The Lord Provost, Bailies Anderson, Roberts, Turnbull, Walcot, Treasurer Boyd, Dean of Guild Sir James Gowans:—

With the object of making an interim report to the Lord Provost's Committee, the sub-committee are of opinion that an abstract of the proceedings which have already taken place should be made, in order to gather up the stages through which the proceedings have passed.

On December 15, 1885, the magistrates and Council remitted the following motion by the Lord Provost to the Lord Provost's Committee:—"That the present municipal buildings being inadequate for the proper conduct of the public business of the city, it be remitted to the Lord Provost's Committee to investigate and report on the whole subject; and, to enable them to do so, to take such professional or other advice and assistance as may be deemed necessary."

The following motion by Councillor Cox was adopted by the Town Council, and Councillor Cox was added to the committee for the purpose of the remit. The motion is of the following tenor:—"That it be remitted to the Lord Provost's Committee to consider whether the time has not now come when efforts should be made to procure for the use of the public a hall in a central position, which shall hold more people (with greater comfort to audience and performers), which shall have better acoustic properties, and which, in the matters of ventilation, entrances, and exits, shall be more worthy of the metropolis of Scotland than any hall in Edinburgh which is at present used for concerts and public meetings."

January 6, 1886.—The Lord Provost's Committee, at their meeting to-day, submitted these motions to the Lord Provost, Bailies Cranston, Anderson, Roberts, and Russell, Dean of Guild Gowans, Treasurer Boyd, Convener White, Councillors Clapperton and Cox.

January 29.—The sub-committee met of this date. The minute of meeting is of the following tenor:—"January 29, 1886. Sub-committee on Municipal Buildings. Present—The Lord Provost, Bailies Cranston, Roberts, and Russell, and Councillor Cox. Without committing themselves or the Town Council to any resolution on the subject, but with the view of obtaining the means of forming an opinion and making a report, the sub-committee assumed that if the present site of the City Chambers was to be included in the proposed new structure, the area to be occupied would extend from Warriston

Close on the west to Craig's Close on the east, and from Cockburn Street on the north to High Street on the south. It was further tentatively assumed that provision would require to be made in the new buildings for the assessors of lands and heritages, the registrars of births, deaths, &c., the Water Trust, Heriot Trust, the inspector of weights and measures, the burgh engineer's department, the medical officer of health, and the collector of police. It was also thought that space might be available for the branch of the Clydesdale Bank now established in the south-east corner of the Exchange Square. It will be seen from this that it is proposed to leave the Police Office for the exclusive use of the Watching, Cleaning, and Fire Departments. With regard to the appropriation of space, the sub-committee were of opinion that there should be provided, in addition to sufficient Council room, two Court-rooms, one for the Justice of Peace and Dean of Guild Courts, and one for the Burgh Court, besides three committee-rooms in addition to the room of the Lord Provost. They were further of opinion that the principal rooms, including the rooms of the principal city officials, should be situated on the ground floor. With these general indications of opinion, and before making an interim report to the Town Council on the subject, the sub-committee desired Mr. Morham to submit a block plan of the ground suggested to be occupied, with any suggestions which might occur to him as to the beneficial occupations of the space."

March 17, 1886.—Meeting of sub-committee of this date, at which Mr. Morham submitted his plan and report.

March 30.—Meeting of sub-committee of this date. Mr. Morham submitted an estimate for new buildings, amounting approximately to 80,000*l.* The sub-committee resolved to recommend that new buildings should be erected on the site of the present buildings and adjoining property, and that a remit should be made, with powers to obtain competitive plans and offer prizes for the first and second designs.

March 31.—The Lord Provost's Committee, at their meeting to-day, approved of their sub-committee's report.

April 12.—The magistrates and Council at their meeting to-day approved, on a division, of the committee's report, and remitted, with powers, as craved in the report.

April 28.—The Lord Provost's Committee remitted to the Lord Provost, magistrates, Dean of Guild, treasurer, Councillors Steel and Colston.

June 2.—Meeting of sub-committee. Present—Lord Provost, Bailies Roberts, Anderson, Walcot, and Turnbull, Dean of Guild, Treasurer Boyd, and Councillor Colston, when there was read a letter from the secretary, Architectural Association, and relative printed rules of the Society of Architects; and the sub-committee sub-remitted to the Lord Provost, Bailies Roberts and Anderson, Dean of Guild, and Treasurer Boyd, to report.

June 18.—Meeting of sub-sub-committee. Present—Lord Provost, Bailie Roberts, Bailie Anderson, Dean of Guild, and Treasurer Boyd. The sub-sub-committee authorised Mr. Morham to have lithographed block plan, showing present building and sections of adjoining closes made, as well as a drawing and photographs of the front and back walls of the present building, and they sub-remitted to Bailie Roberts and the Dean of Guild, to consult with the town clerk and Mr. Morham, and report on the conditions of the competition and form of advertisement.

July 14.—Meeting with Bailie Roberts and Dean of Guild (also Bailie Cranston), who instructed the notice to architects, which they went over, to be put in print.

July 23.—At a meeting of the sub-committee. Present—Lord Provost, Bailies Cranston, Roberts, and Anderson, and Dean of Guild. Proof of conditions of competition by sub-sub-committee submitted. The paragraph on page 4, rubric of which was "style," was deleted, otherwise the proof was approved. A print marked "Proof, Private," being schedule of floor space, was also submitted and approved. Instruct Mr. Morham to show on the block plan the whole property occupied by M'Laren, Son & Co, and authorise him to accept W. & A. K. Johnston's estimate for lithographing, 16*l.* 10*s.* 6*d.*, and Annan's for photographing, and authorise the town clerk to advertise for plans.

August 21.—Meeting of sub-committee. Present—Lord Provost, Bailies Cranston, Anderson, Turnbull, Walcot, and Russell, and Dean of Guild Gowans. Letters from Mr. Adams, secretary to the Royal Institute of British Architects, and from Messrs. Chorley & Connon, architects, Leeds, produced and read. Remit to Dean of Guild Sir James Gowans and Mr. Morham to adjust a reply.

August 30.—Meeting of sub-committee. Present—Bailies Cranston, Roberts, Anderson, and Russell, Dean of Guild Sir James Gowans, and Councillor Steel. Letter from the Royal Institute of British Architects, dated August 25, read. The sub-committee resolved that no modification of the schedule of conditions can take place. Remit to Mr. Morham to frame replies to the other questions submitted by architects, subject to the approval of the Dean of Guild.

September 7.—Motion by the Lord Provost as to the promotion of Bill in ensuing session of Parliament, adopted by the Town Council, and remitted to the Lord Provost's Committee.

September 14.—The Lord Provost's Committee remitted the motion to the sub-committee.

October 15.—Meeting of sub-committee. Present—Lord Provost, Bailies Cranston, Anderson, Roberts, and Russell, Convener White, Mr. Beveridge, Parliamentary Solicitor; and Mr. Paterson, Burgh Assessor. *West Boundary*, M'Laren & Son. Letter from them dated October read. After explanation by Mr. Paterson, who is preparing the Book of Reference, the sub-committee resolved that no portion of Messrs. M'Laren's property should be included in the site of the new buildings, except that strip or small portion on the east side of their present front shop, drawn in a direct line through the shop in a line with the west boundary of Warriston Close, although it may be necessary to include compulsorily the whole area; and the Town Clerk was authorised to enter into negotiations with Messrs. M'Laren & Son to have all this brought about by agreement before the Bill is lodged in Parliament, as also with the firm of Messrs. W. & R. Chambers, that their respective entrances from Warriston Close shall not be interfered with, or will be reinstated if altered. Mr. Paterson reported that the Book of Reference was nearly completed. The committee instructed Mr. Morham to prepare the Parliamentary plans.

October 25.—Meeting of sub-committee. Present—The Lord Provost and Bailie Anderson. On consideration of various letters from competitors, the sub-committee resolved to give effect to the suggestion made by several of the competitors that the time be extended for lodging plans to January 31, 1887, instead of December 31, 1886, intimation of which to be sent to each competitor.

November 12.—The Clerk submitted letters from some of the competitors, asking, since the restriction of the site had been made, if they should proceed to complete their designs with reference to the original site on the first block plan, with a view to their adaptation by the committee to the restricted site, and he was instructed to refer the writers to his circulars of October 18 and 26, sending the supplementary plan, and postponing the time for lodging designs to January 31, 1887, and to return the deposit to those asking it. Further, the committee authorised the projecting stair at 251 High Street to be included within the scheduled area, and the employment of Messrs. W. & A. K. Johnston to lithograph the Parliamentary plan. They directed the Parliamentary notice to be inserted three times in each of the *Scotsman* and *Evening News*.

(Signed) THOMAS CLARK, Lord Provost.

Edinburgh, November 12, 1886.

The Lord Provost's Committee directed their sub-committee's interim report to be submitted to the magistrates and Council at their first meeting, and in the meantime instructed the Town Clerk to have the same printed and circulated among the members of Council.

(Signed) THOMAS CLARK, Lord Provost.

AN IDEAL CITY.

ON Saturday, Mr. F. Harrison lectured on "The City in Ancient, Mediæval, and Modern Times," at Toynbee Hall, Whitechapel. In the course of it he said the first great fact that struck one was that the modern city was in a far lower state of organic life than either the ancient or the Mediæval town. The modern city was intensely changeable. It was an amorphous mass of buildings, grimy, noisy, and bewildering. It was the embodiment of indefinite change. In Edinburgh the sense of civic patriotism was still found, and York, Nottingham, Leicester, and a few other towns possessed the sacred fire. Abroad this quality was shared by Paris, Vienna, Rome, and Naples. The monstrous, oppressive, dismal bulk of modern city life was becoming one of the great evils of civilisation. It was a calamity that such a considerable fraction of the entire population of England should, as Londoners, be cut off from country life and city life also, as those were who dwelt in the suburbs. It must be admitted that in some respects many modern cities compared favourably with their predecessors. In spite of smoke and steam and factories the death-rate in many places was below that of ancient and much below that of Mediæval cities. London, for example, was the city least noxious to life of all the great cities in the world. Its death-rate was 25 per cent. below that of Paris, 50 per cent. below that of Berlin, and 200 per cent. below that of St. Petersburg or Calcutta. After referring in commendatory terms to the pure water supply of towns like Birmingham, Glasgow, and Nottingham, and to the spontaneity and excellence of the countless independent charitable, educational, and social institutions which existed in the towns of England, the lecturer drew a picture of the city as it could be imagined. Such a city, even if a capital, ought not to contain

a population of over a million. One-fourth or one-fifth of that figure would be preferable. London should divide itself into eight or ten cities, a change for which its subdivision under the new electoral system might be considered to have prepared it. The inhabitants of the ideal city ought to enjoy air, light, and water unlimited in quantity and free of cost. Every chimney must consume its own smoke. The city would have its squares, parks, playgrounds, and gymnasia within the reach of all, and would contain many noble public buildings and monuments. Museums, art galleries, libraries, lecture halls would be free and within a mile of every man's home. Means would thus be given to every one to cultivate body and mind. For the realisation of his idea he did not rely on Acts of Parliament. Such ideals were to be realised solely by long efforts and after many mistakes and failures. To reach them we needed the vivifying force of a higher social morality, a loftier standard of life, and a deeper social religion.

TESSERÆ.

Academies of Art.

GUSTAF WAAGEN.

IT must not mislead us in favour of academies that in our times a great many of the most celebrated artists have been members of academies; from the beginning it must have been the interest of these academies, by the reception of persons who enjoy a great reputation, to procure to the academies splendour and distinction which otherwise would have been wanting. With this another injurious effect of the academies has been connected, by means of the official distinctions which they enjoy through the influence of the State. They have attained a preference over all the artists that do not belong to the academies, which the academies watch over very jealously, and have thus introduced into the freedom of art an unsalutary degree of authority and interference. It occurs often that a very mediocre artist, of which every academy counts some few amongst its many members, stands much higher in the State as an academician than the most talented artist who does not belong to an academy. As the majority of mankind look more on authority than on genuine merit, it has occurred often that a moderate artist, being an academician, has found plenty of employment, while artists of considerable talent who do not belong to such an institution remain unemployed and unnoticed. If it is asked how the artists in modern times can be taught in a better manner, we may lay down the following remarks. The favourable relation in which the pupil stood to the master in the ancient times might be restored to a certain degree by these means—that artists of distinguished reputation should be induced to open studios. Most artists would be induced to open studios if the Government provided them with the locality and a moderate remuneration; besides this, every pupil would have to pay a moderate sum for the use of living models. How important such a system is for the formation of artists may be seen in the example of Prussia: for sculpture, the studio of Professor Rauch, in which many distinguished artists have formed themselves in a good manner; and the most remarkable instance in painting is the school of Dusseldorf, which the Government founded under the direction of William Schadow. Within eight years several artists distinguished themselves, who in originality and ability have surpassed all who for a long time have been formed in the academy at Berlin.

Greek Cistæ.

C. T. NEWTON.

This name is usually given to boxes or caskets, generally of a circular, but occasionally of an oval form, and usually made of bronze alone, though *cistæ* have been found of which the body has an inner lining of wood or leather. These caskets sometimes contain strigils and other objects used by athletes in the bath, and sometimes a variety of articles for the female toilet, such as the Romans called *mundus muliebris*. Round the body of the *cista* usually runs a frieze, representing some mythical subject incised in outline, and similar subjects often decorate the cover. The *cista* was carried in the hands by chains attached to the body, and the cover was usually surmounted by a group of two or more figures in the round (*epithema*) which formed the handle. The bottom of the *cista* usually rests on the three animals' feet, above which is frequently a group in relief. The incised figures are for the most part not more carefully drawn than the designs on Etruscan mirrors, which are very analogous in style. In some few examples, as, for instance, in the Ficoroni *cista*, the drawing is most refined and masterly, and, though the *cista* is apparently of Roman origin, it must be attributed to an artist trained in the Greek school. The groups which form the handles of these vessels, and the reliefs above the feet, are executed in the mechanical manner which characterises much of the Etruscan art in bronze, and it is probable that these decorations were not wrought by the artists by whom the friezes were incised, but that they were supplied as a manufactured article in great numbers, while more skilled hands were employed on the friezes. The date of these *cistæ* is probably about the year 300 B.C. These vases were formerly called *cistæ mysticæ*, and were thought to have been employed in the Dionysiac mysteries. This theory, however, finds few supporters at present. Upwards of seventy *cistæ* are extant, the greater part of which were found at Palestrina (Præneste). It is, however, probable that they were not exclusively manufactured there, as the feet and handles, which, from their solidity, are little subject to decay, have often been found in Etruria. The extreme thinness of the incised metal of the body would cause it to decay except where some special quality of the soil or other circumstance favoured its preservation.

Chimneys.

E. M. SHAW.

For those parts of a chimney which are supported throughout, stone may under some circumstances be admissible, but brick is always preferable for the purpose. The abutments of a chimney should be tied into the walls by wrought-iron bars of sufficient number and strength, turned up and down at the ends, and built into the jambs for several inches on each side. No part of a flue should be of less thickness than half a brick or 4½ inches. Where slabs of stone or slate are placed level with a floor before the opening of a chimney, they should invariably be laid in sound mortar, cement, or other incombustible and non-conducting substance, and it should be at a distance of not less than 4½ inches from the joists, flooring, or any other woodwork. A chimney built only up to the roof and stopping at that point is always dangerous. Every chimney in a house should be perfectly distinct and separate from every other chimney from the hearth to the external opening. Chimneys may safely be built in stacks, but they should on no account have any connection within the stacks. Brickwork around flues should not be less than 4½ inches thick in any part. By the Code Napoléon it was not permitted to build a chimney against the wall of an adjoining house without isolating it by an intermediate wall, of sufficient thickness to prevent heat passing to the neighbouring premises.

Hindoo Temples.

SIR G. C. M. BIRDWOOD.

The Hindoos themselves classify their temples according to the idols worshipped in them. The *mandira* is dedicated to the *lingam*, and is double-roofed. The *deula* is sacred to Jagannatha, and has an iron image of *Garuda* on the pinnacle. The *trisula* in the pinnacle distinguishes the temple of Siva, and a wheel one of Vishnu. The *pancha-ratna* ("five gems") temple has four smaller turrets at the corners of the square cell from which the central tower springs, and is dedicated to Vishnu in his various form of Krishna. The *nava-ratna* ("nine gems"), also a Vrishnata temple, has a double roof like the *mandira*, with four turrets on one roof and four at the corners of the central tower which forms the other. The *Vishnu-mandira* and the *Chandi-mandira* are small, flat-roofed temples or cells sacred to Vishnu and Durga or Kali respectively. The *yora-bangala* is made like two thatched houses placed side by side, and is used for different gods. The *rasa-mancha* is an octagonal temple with eight turrets, sacred to Krishna. The *dola-mancha* is a smaller building. The *deva-laya* consists of a number of temples built in a square.

Greek Thomson.

D. THOMSON.

In the works of the late Mr. Alexander Thomson we have a fine series of designs of a character so unique and excellent as to excite our wonder at the fertility of his inventive faculties and our admiration at the beauty, richness, and vigour of his handling. In all of them he set himself to adapt the principles of Greek art to modern requirements, without any pedantic borrowing of their features. Indeed, it is quite surprising how seldom we find in his works the orders reproduced, with their details strictly conforming to the ancient remains. He more frequently originates some form of column and capital designed to meet the special requirements he had to deal with, or to conform to the character of the impression he wished the building to convey; but where he has used the orders they are appropriately placed, finely proportioned and detailed, with carefully-adjusted relief, the wall-space behind being kept subdued in tone, with no disturbing objects in it to mar the repose and quiet dignity of the design. The multiplicity and variety of the details and forms he introduced into his works, and the singular grace and unity of effect he maintained throughout, are deserving of our most careful consideration, showing as they do that to adopt a style does not necessarily imply that only those marked features and peculiarities of detail and com-

binations which are found in the original works are to be reproduced, but that new forms and details may freely be employed, provided we have skill enough to maintain the spirit and essential qualities of the style. Of none of his designs can it be said that they are very like the old work, a term of praise we often hear applied to the works of our best men of Mediæval proclivities; but, whilst they differ from the works of the Greeks as distinctly as the nature of our requirements do from theirs, they agree with them in the adaptation of forms to the purposes they subserve—the grouping of the parts into forms in which the horizontal lines predominate, the clear marking of the voids, the precision of the distribution, and the graceful adjustment of light and shade, with strength and placidity as a general expression. Only by the adoption of such principles as these can building be raised into a fine art. His churches in St. Vincent Street and Caledonia Road, Glasgow, are in his best manner, while the various warehouses and other street buildings by his hand are all marked by the same elegance and refinement of detail, and display the abundance of his resources in design, and his power of impressing on them his own ideal perception of art.

Egyptian Bricks.

S. Birch.

Bricks—*tebi* made in a mould, or sun-dried clay mixed with straw, pounded pottery, and other materials—were extensively used for construction in ancient Egypt. At the earliest period the use of baked bricks was unknown, but some objects of this class occur at the time of the twelfth and following dynasties of baked red terra-cotta of conical or square shape, the use of which is not decidedly known. The bricks of unbaked clay vary in dimensions from 1 feet 8 inches to 1 feet 3 inches long, and are in thickness from 8½ to 4½ inches, and weigh about 16 lbs. The largest are those of the earliest dynasties before the sixth, and they become of smaller dimensions under the eighteenth and following dynasties. At the earlier period rude marks, spirals, curves, or devices, made by pressing the finger or fingers of the hand into the moist clay, were impressed on the bricks; but at the time of the eighteenth dynasty stamps were introduced of an oval or square shape, having in relief the prænomen or name of the monarch, or the name or titles of the persons for whose buildings or constructions they were made. The stamps on the bricks commence under the eighteenth and continue to the twenty-second dynasty. These bricks were extensively used in the construction of pyramids, palaces, walls, private houses, fortresses, and other constructions, the absence of rain making them sufficient to withstand the climate. Representations of the making of them by foreign captives or prisoners of war corresponding with the account of the bondage of the Israelites, and the labours imposed upon them, are seen in the tombs of the eighteenth dynasty.

Telford and MacAdam as Roadmakers.

Sir J. Rennie.

Telford, previous to his being employed to construct the Caledonian Canal, had turned his attention to road-making, and was appointed by the Government to lay out new lines of road, both for the purpose of employing the then poor and thinly scattered population of the Highlands, as well as to improve the districts by more general intercourse with the rest of the kingdom. He evinced a skill and knowledge which had not hitherto been bestowed on this important subject, but which was afterwards developed upon a greater scale in Ireland, and, lastly, in England, in his great works, the Holyhead, Liverpool, and Great North Roads, formed in consequence of the increased communication with Ireland after the Union, and which were excellent models for roads throughout the kingdom. Telford set out the roads according to the wants of the district through which they were made, as well as with a view to more distant communication; and the acclivities were so laid out that horses could work with the greatest effect for drawing carriages at rapid rates. The road was formed by a substratum of large stones, with sufficient interstices between them for drainage; the materials laid on this foundation were hard and angular, broken into small pieces, decreasing in size towards the top, until they formed a fine hard surface, whereon the carriage-wheels could run with as little resistance as possible. The transverse section of the road had no greater convexity or rise than was sufficient to cause the water to run steadily into the side-drainage channels; by this means, the carriages not being inclined laterally, the weight was more equally divided on the wheels, whereby they moved more easily and with the least wear and tear of the roads. The surface of the road was always kept even and clean, by the addition of proper fresh materials where necessary, and distributed equally in thin layers immediately after rain, in order that the new materials might bind and incorporate properly with the old. Telford's system was afterwards extended by his assistant, Macneill, and is fully described by Sir Henry Parnell, afterwards Lord Congleton, who, by his perseverance and support of Telford, mainly contributed to its extension and success. About the year 1816 MacAdam introduced his system, and brought it into general use in the vicinity of Bristol. It resembled in some respects that of Telford, but differing from it by making no foundation in the first instance; it consisted in simply laying a stratum of flints, or other hard materials, 10 or 11 inches thick, broken equally into small pieces about 2 inches diameter, and spread equally over the intended road; this soon became so consolidated together by carriages passing over it, that they could travel with great facility and expedition. The section and the mode of applying fresh materials and keeping it clean resembled that of Telford. MacAdam, professing to be a road-maker only, devoted his whole time and attention to the propagation of his system, which was greatly superior to the old, and became very generally adopted. Its introduction and extension was in a great degree due to the Earl of Lonsdale, and to his lordship's exertions we are indebted for the present system of metropolitan roads, which has proved of great advantage to the public.

Simplicity of Italian Gothic.

W. S. Okely.

In Italian architecture generally the simplicity of the various members is a marked characteristic, the beauty of effect being left to colour and harmonious proportion, where in churches north of the Alps it would have been obtained by the strong lines of shadow formed by the deep-cut members and by ornamentations in different planes. We frequently find in Italy, it is true, ornament produced by incisions, as well as mere surface decorations, such as colouring and mosaics; but it may be said in such cases that the stones used in the building are ornamental, rather than the ornament forms a part of the main design. This is literally true of some of the older churches, where stones belonging to the different members of Classical buildings were used with their ornamented faces placed in view, and arranged in as symmetrical a manner as could be improvised at the time; and it may account for the character of the ornamentation which, when Classical fragments were no longer to be obtained, were adopted in the later Italian façades.

The Development of the Doric Order.

T. L. Donaldson.

It seems to be certain from the evidence brought forward by Canina that the Ionic as well as the Doric was invented before the Persian invasion of Greece by Xerxes; and in fact the example at Samos, given in the works of the Dilettanti Society, so peculiar in its design, proves a very remote epoch, not a decline of a previously well-conceived and highly-finished example, but the first rude attempt at somewhat not yet matured and perfect in its conception. We may hence conclude that in the period between the Trojan war and the Persian invasion the Greeks, although distracted by internal wars, still pursued the art with perseverance, and following the right traces. They seem to have made a point of studying nature as the source to direct them in the principles of art; and as in those of painting and sculpture they sought in the finest forms of the Grecian youth and in the exquisite figures of the athletes and runners in the sacred games, the proportions of their heroes and their gods, so they recurred to the productions of the vegetable world and the parts of the log hut or wooden temple for the principal features of the orders and graceful details of the mouldings which gave a charm to, and relieved the heaviness of, their substantial constructions. We may assume as certain that the Corinthian order had not yet been discovered; for otherwise we should find it doubtless employed in those edifices, at least in some parts, erected immediately after the Persian invasion. Nor probably had the Ionic yet established its claims, as I said before, to be considered a perfect conception, for unless restrained by a superstitious veneration for antiquity, or an attachment to established forms, we might suppose that the Theseum and Parthenon would have been raised in all the sumptuousness of the more enriched parts of the Ionic. That the Doric was perfect in all its parts at the Persian invasion we may infer from the fragments of the large Doric order, whose blocks form part of the citadel walls of the Acropolis of Athens, and which seem with all reason to be the ruins of the original Parthenon destroyed by the Persians and worked up when the citadel was rebuilt. We may judge also from the fact that the temples of Sicily and Magna Grecia, which appear probably to have been erected soon after the settlement of those colonies, contain all the parts of the more refined productions of Ictinus, although of more massive proportions, of ruder workmanship, and with some greater crudity of detail. The Doric example at Corinth, apparently the prototype of the Sicilian and Magna Grecian temples, is the expression of a masculine and fierce sentiment; the Athenian models the emanation of a gentler and more refined feeling. This pervaded the entire of Attica, at Eleusis, Rhamnus, and the Promontory of Sunium, as the other did Syracuse, Girgenti, Selinus, Pæstum, Metapontum.

NOTES AND COMMENTS.

THE Spalding Club, which was founded in 1839, rendered invaluable service to Scottish history and archæology by the publication of ancient documents and memoirs. After thirty years it was decided to suspend the operations, and a set of the volumes is a treasure which is eagerly sought by collectors. Since that time many sources of imformation have come to light, and it is thought advisable to create a new Spalding Club, which is to deal mainly with the archæology of the counties of Moray, Banff, Aberdeenshire, Kincardineshire, and Forfarshire, but if materials are forthcoming, Inverness, Sutherland, Caithness, and Orkney would be included. The district is rich enough in old houses, which should supply an abundance of traditions. The club is to consist of four hundred members, and the annual subscription is to be a guinea. Aberdeen is to be the headquarters of the club. Up to the present there are 375 applications for membership. The Earl of ABERDEEN will be first president. Although we cannot discover the name of an architect in the long list of the council, we hope that the new Spalding Club may rival its famous predecessor in utility and success.

THE Slade Professor at Cambridge, Mr. JOHN HENRY MIDDLETON, was on Thursday in last week presented to the congregation of the University for the degree of M.A. *honoris causa*. He was introduced by the Public Orator, Dr. SANDYS, as one who, in his wide attainments and varied learning, was a brilliant instance of the truth of the observation of VITRUVIUS: "Architecti scientia pluribus disciplinis et variis eruditionibus ornata est." The Orator also referred to Professor MIDDLETON'S travels, as an investigator and critic of architecture and other arts in many parts of the world, including Greece and Italy, and alluded in particular to his residence in Rome, and to his excellent work on that city, "Ubi urbis æternæ inter monumenta vitæ suæ tabernaculum tam diu collocavit." He observed, in conclusion, that no one could be surprised that an authority of such taste in the province of art should have taken up his abode in Cambridge under the shadow of so fair a fabric of architecture as King's College Chapel.

IN the exhibition of French pictures which was held a few years ago in the Dudley Gallery, there was a marvellous sketch of a long low gallery in the Hôtel Dieu, with the light falling on a corpse that was near the white wall. It was one of the works by M. GERVEX, who has so often shown himself to be a master of realism. In the next Salon M. GERVEX will break a lance with REMBRANDT, for he has a picture in hand which represents M. PÉAN, the surgeon, giving a demonstration to his pupils. In the Dutch picture the subject of the operation is a man; in the French picture it is the body of a woman. M. GERVEX is a master of the figure, and the portrait in this year's Salon shows what he can do in portraiture. His picture will be sure to be among the earliest sought in the exhibition. Like so many artists, M. GERVEX is to have an atelier, but ladies alone will be eligible to be students, and especially those who will paint as amateurs.

SOME months ago we related a strange story about a table, which gave rise to a good deal of amusement among the amateurs of Paris, for it shows their fallibility. At the time the first steps of a law suit were about to be taken; now the case is ended. As our readers may have forgotten the circumstances, we now repeat them. An amateur, M. VEIL-PICARD, invited M. BOISLÈVE, an expert, to look at a table of the purest LOUIS XV. style. On his arrival he was told that the table was worth 60,000 francs at least. M. BOISLÈVE inquired if it were to be sold, and was informed in reply that for it no smaller sum than 30,000 francs would be taken. As the table appeared to be a splendid example of the period, M. BOISLÈVE and his partner called on a M. PERDREAU, who, on their advice, gave the required sum. The partners reserved 5,000 francs for their commission, and handed over the remainder to M. VEIL-PICARD. M. PERDREAU lost no time in displaying his treasure to a friend, who informed him that the table was well known, and was not what it was represented to be. An action was accordingly brought before the Tribunal of Commerce, and the case was referred to M. BAUER, an authority in such cases. He said that the connoisseurs, however keen, might be deceived with the table. Among the sculpture were charming details, the wood appeared old, and the gilding had the *patina* that is supposed to be a sure sign of age. M. BAUER, however, said he was not to be taken in, as the restoration was evident to him at the first glance. The table was reconstructed under the direction of M. ANDRÉ, an antiquary, and for the gilding and *patina* a sum of 3,000 francs was paid to a M. FOURNIER. The decision of the Tribunal, therefore, was that the sale should be annulled, that the table should be taken back by MM. BOISLÈVE and FRANCK, who were to repay the 30,000 francs. As to the amateur, who received double the sum that he paid for the table, the Tribunal decided that he was beyond their jurisdiction, since he was not engaged in commerce. Amateurs should be happy in Paris under such laws.

MR. BASSETT KEELING, who died a few days since, was an architect whose name was well known in the City. In 1853 he entered the office of a Leeds architect, and subsequently he acted as head-master of a local school of art. In 1860 he came to London, and was soon fortunate in securing a large share of practice. Among the churches entrusted to him were All Saints', Camberwell; St. George, Campden Hill; St. Paul, Norwood; Christ Church, Old Kent Road, and St. Saviour, Kensal New Town. He was, however, mainly known by his large buildings in the City. He designed the Tokenhouse Buildings, the White House, the Jerusalem Coffee House, and the Auction Mart Restaurant. Mr. KEELING was also the designer of Princes Mansions, Westminster, which occupy 51,580 square feet, and have a frontage of 393 feet. Although he had acquired so many commissions, he was only in his fiftieth year at the time of his death. Mr. KEELING'S business has been taken up by his second son, Mr. GILBERT KEELING, who was for some time associated with his father, the eldest son being head of the firm of KEELING, TEALE & CO.

WHEN the late JOHN WEALE started his most useful Rudimentary Series of cheap books on architecture and engineering, he received a good deal of support from military engineers and army men. Among the authors who helped him was Mr. J. F. HEATHER, M.A., one of the mathematical masters in the Royal Military Academy at Woolwich, who wrote the treatises on mathematical instruments, and compiled those on descriptive geometry and plane geometry. He was also the author of other works which are adopted as class books in military schools. On Saturday last Mr. HEATHER died in London, where he lived after he retired from the public service. As a contributor to WEALE'S Series he rendered a service to technical education.

IN front of Notre Dame, Paris, there is a fine equestrian figure of CHARLEMAGNE. It is generally supposed that this work belongs to the city of Paris; it is, however, only a speculative production. The owners are MM. THIEBAUT, the founders, whose names are associated with so many examples of bronze statuary. The question of its purchase is at present before the Municipal Council.

THE power which individuals can have in parish churches is curiously illustrated by a case which is now before the Commissary-General of Canterbury. A faculty was applied for to enable alterations to be carried out in Bearstead parish church at a cost of 138*l.* 17*s.* 6*d.*, and according to plans prepared by Mr. CHRISTIAN. Although the amount to be expended is small, the parish is in arms over the subject. It is proposed to construct an organ chamber on the south side of the chancel, and to remove there the organ, which is now at the north-west corner of the church; to remove with the donor's consent a memorial window on the south side of the chancel to the next window on the same side in the nave; to remove the piscina and sedilia, which occupied part of the space where it was proposed to put the organ; and to set back the front pews in the chancel, on the north side, a few inches, so that an open seat might be erected in front for the boys in the choir, while the adult choristers would occupy the pews at the back. The two front pews are claimed by a lady as freehold property, as they form part of the Milgate chantry, and the claim is supported by several inhabitants. The case is not concluded.

THE FIRS.

THE Firs, at Worplesdon, Surrey, is a picturesque alteration, or rather rebuilding without entirely pulling down, of a house that is situated in a most delightful position, looking over the Merrow Downs, above Guildford, and the Valley of the Wey. It is of rich-coloured red brick, cut and carved, and generally, with the white frames, &c., produces a fine mass of colour in the midst of deep fir foliage, the effect of which is necessarily lost in the reproduction in black and white of the Academy picture, which fairly represents this contrast. The original drawing was in highly-wrought water-colour by Mr. NATTRASS. Mr. C. J. HAYWARD, F.S.A., 47 Museum Street, W.C., is the architect.

FRIEZE FROM ST. SPIRIDION, TRIESTE.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE second ordinary meeting of the Institute of Architects was held on Monday evening, Mr. E. l'Anson, president, in the chair.

The decease was announced of Mr. George Devey, Fellow, of Mr. A. R. Fraser, Associate, and Mr. George Vulliamy, past vice-president.

The Late George Vulliamy and George Devey.

The PRESIDENT said these announcements came on them with painful interest. No doubt many present would wish to speak to their memory. As became him in his position of President, it would be his duty to convey their condolences to the widow and family of the late Mr. Vulliamy.

Mr. CHARLES FOWLER rose and expressed his earnest sympathy with the President's proposal.

Mr. WOODTHORPE, senior member of the body of district surveyors, said he rose with difficulty, feeling as he did the loss of so valued and dear a friend as the late Mr. Vulliamy, and he felt he spoke the sentiments of the profession when he said it would be difficult to find his counterpart. He had known Mr. Vulliamy from an early period, many had known him as a personal friend, and knew him as a man of intelligence and high attainments, one who would have shone in a leading position at the head of the profession. It was not Mr. Vulliamy's fault that he did not occupy that position, but for want of opportunities to display his talents. He was possessed of clear judgment, sound common sense, a most gentlemanly demeanour, and the manner he conducted himself towards the Board of Works and towards those who came before the Board was particularly welcome to the profession. Loss of friends was one of the sad trials that beset men as they advanced in life, and they had to submit to it.

Professor KERR said the loss of Mr. Devey, an architect distinguished by his work and a credit to his profession, must not be passed by without a word.

Mr. G. AITCHISON, A.R.A., said he had enjoyed more than thirty years' acquaintance with Mr. Devey, and could endorse what Professor Kerr said of the extreme delicacy of design and great competency of their late brother. At their first interview Mr. Devey had shown the sketches of all the lamps made by him on the Continent, and later he had seen works executed by him. He was an artist of great talent, elegance and refinement, and of extreme taste. His disposition and his general manner were of the most kindly description.

Mr. R. PHENÉ SPIERS said Mr. Devey's works were little known, as he always made models for his work. He suggested that when the record of his life should be written for the Institute it should be accompanied by some illustrations from his models, to show the fertility of design which characterised all he did. He also had had photographs taken of his works by Messrs. Bedford & Lemere, and it would be most desirable if they could show a series of these.

Professor T. ROGER SMITH said that if Mr. Vulliamy's life was written for them, his drawings should also be illustrated. Among other parts he had travelled in Egypt, and made very beautiful sketches there.

Mr. JOHN HEBB said he desired to say a few words in memory of his late chief, Mr. Vulliamy, with whom he had passed the last ten years as assistant. It would be difficult, he said, to find a man more kind, considerate, more appreciative, and more gentlemanly in every sphere of life. Mr. Vulliamy began life many years ago, and many of the present generation thought of him only as the architect to the Metropolitan Board of Works, and did not remember that he commenced life as an architect and artist of great ability. He was originally intended for an engineer, but not satisfied with the progress he made, he was articled to Sir Charles Barry, and afterwards travelled over Greece, France, Italy, and Egypt, making sketches and measuring a great number of monuments, including Karnac and the larger temples in Egypt. On returning he commenced business as an architect, and achieved a good position, but, dissatisfied with his slow progress, he joined Lewis Vulliamy, his uncle. Most of the drawings for the works there were made by his own hand, including all the drawings for Dorchester House. But his uncle was not a man of particularly adaptable nature, his temper not being of the sweetest kind, and his nephew's patience being exhausted, when the office of architect to the Board of Works became vacant, he put up as a candidate and was elected. As an independent architect, he built the church in Ennismore Square, a pure Italian work of considerable refinement. Other works of his were a Gothic building, the French Protestant church in Bloomsbury Street, and a house in Merionethshire for Powell ap Griffiths. When he joined the Board of Works his artistic work might be said to have closed. The work of the Board did not require any great artistic power, the buildings of the Board being of a utilitarian character. But remarkable traces of artistic genius were to be seen in his little group of buildings in Queen Victoria Street and Bucklersbury, and which were distinctly different from the architecture met with in the City. He also designed the lamp standards for the Thames Embankment, simple and appropriate in design, and fortunately selected instead of a design originally intended, of standards with cupids holding torches. The public had great confidence in Mr. Vulliamy, and most of the profession must have been struck with his constant courtesy and refinement of manner, and that distinction which is only associated with refinement and knowledge of the world.

Mr. PERCY STONE said he was the only pupil taken by the late Mr. Devey, and having referred to Mr. Devey as a disciple of Mr. C. A. Voysey, paid a tribute to his memory. Some of the marvellous lamp sketches of Mr. Devey were being mounted, and he hoped would soon be seen on the walls of the Institute rooms.

Mr. Philip Herapath, lately elected Fellow, of Auckland, New Zealand, and others, were formally presented to the President.

At the late examination under the Metropolitan Building Act, Messrs. F. R. Farrow, H. Blackburn, W. C. Evans, Brooker, Swatman, jun., and E. W. Mountford had obtained certificates of competency; also Mr. J. C. L. Bettridge, of Birmingham, had obtained a certificate as building surveyor, being the first candidate who had passed under the new examination of the Institute last year.

The PRESIDENT announced that under by-law 44 the following had ceased to be members of the Institute :—Messrs. T. Mitchell, C. M. W. Davies, E. E. Deane, Boston, U S.; F. W. Hyde, Brighton; E. Jenkins Jones, R. J. Cresswell Jones, Ryde; W. E. Macarthy, F. H. Mullins, J. F. Shenton, E. Webb, Exeter; and Richard Wood, of Chicago.

Mr. WHITE, secretary, then read a paper by M. Paul Sédille, in the absence of that gentleman, under the title of "Etude sur la Renaissance de la Polychromie Monumentale en France," of which the following is an abstract :—

Polychromy.

The author showed at the outset that the ancient and traditional custom of colouring exteriors in France had declined by the reign of Louis XIV. The eleventh-century paintings on the Church of St. Savin, near Poitiers, were the oldest extant in France. Polychromy had been employed very largely in later centuries, and the façade of Notre Dame de Paris still bore traces of paintings, as did also the greater portion of the ecclesiastical edifices of the thirteenth, fourteenth, and fifteenth centuries. The wooden frontages of residences were also painted, while pottery and glazed tiles were encased between the beams. During the Renaissance, the influence of Italian taste transformed external polychromy; colouring was subdivided and localised, the paintings being often enriched with gilding, marble, and enamels. Terra-cotta and glazed materials were much used. The monuments of those cities famous for the works of Luca della Robbia and his school were the sources of inspiration. Moulded to its own taste by the French Renaissance, coloured architecture appeared less marked at the end of the sixteenth century, and diminished during the seventeenth, although found under new aspects in the half-tile, half-stone façades of the Louis Treize period. From this epoch it disappeared almost entirely. With the era of the "Grand Roi" was inaugurated the solemn architecture imported by the Jesuits and Bernini. French artists, while imitating Italian buildings of the end of the sixteenth century, thought they followed the spirit of ancient Roman art. They restored antique edifices by robbing them of the splendours of their

colouring, and reducing them to the bare beauty of form and proportion. This dealt a fatal blow at coloured architecture, not only in France but in all those parts of Europe which had any architectural pretensions. During the eighteenth century colour was absent from every architectural conception, the total eclipse of this radiance was a veritable singularity in the historical records of architecture. All ages and peoples had given polychromy a prominent place in architecture. Architecture was the outcome of the great laws and aspects of nature, and was not colour the manifestation of nature? Could one imagine an object without its appropriate colouring? White and black were but light and shade intensified, and used as a setting to convey the full effect of the infinite varieties of colour. It might logically be hoped that colour would reassume over architecture those rights which belonged to it from time immemorial. In the style called "Louis Seize" a few light ornamental paintings vainly attempted to restore colour to the panels of doors and wainscoting. The Revolution, the Directorate, and the Empire for a long time overcame these fancies for colour. The *style Impérial*, in spite of its pompous stiffness, was, however, not wanting in brilliancy and masterly qualities of composition. Moreover, the art of the First Empire was represented by two talented men, Percier and Fontaine, and it might be assumed that had Percier been less influenced by the taste of the age, he would not have been unmoved by the charms of colour. His design for the interior of a Salle-de-Musée, decorated with ornamental paintings of delicacy and harmony, is a proof of this. During the Bourbon Restoration architecture remained stationary, but the Revolution of 1830 signalised the advent of a new era. With the restoration of the souvenirs and monuments of France of the olden time, attention had been called to the arts of the Middle Ages and the Renaissance. The works of Vitet, of Prosper Mérimée, of De Caumont, of Didron, and later on of Viollet-le-Duc, familiarised the public with Mediæval art. Wall paintings reappeared in old buildings, freed from the whitewash of previous centuries, and colours, used in interiors, were soon to be produced on exteriors. A succession of important works on ancient art contributed to this return of polychromy. Hittorff was one of the first to search for colour on the monuments of antiquity. Segesta, Selinus, and the temples of its Acropolis were objects of his studies when in 1823 he visited Sicily. The results of his observations he had communicated to the Académie des Beaux-Arts, in several papers which created a great sensation. Encouraged by some, violently opposed by others, Hittorff saw his opinions passionately rejected or accepted, but the subsequent labours of the students at the Ecole de Rome proved the accuracy of his theories. In 1851 he published "L'Architecture Polychrome chez les Grecs," containing a restoration of the temple of Empedocles at Selinus. Hittorff had restored in like manner the three temples which stood close to the acropolis of Selinus. Théodore Ballu and Paccard were the first who left the Villa Medicis to study the ruins at Athens, and in 1845 and 1847 respectively restored the temple of Minerva Polias, and the Parthenon, but the colouring was not represented in the bright colours of a newly-finished work. In 1848, Tetaz resumed the studies carried on by Th. Ballu at the Erechtheum, but M. Charles Garnier was the first who displayed, in his restoration of the temple of Jupiter Panhellenius in Ægina, Grecian polychromy in all its pristine brilliancy of tone. As a reminder, M. Sédille mentioned the works of several other French architects, and among them the restoration of Pæstum by Henri Labrouste. The excavations at Pompeii had periodically brought to light painted apartments. Constant-Dufeux had stated his belief that the Trajan column had at one time been entirely painted. Hittorff set the example of using colour in important works. His Cirque in the Champs-Elysées was a valuable testimony to the effects that polychromy could produce. Duban was one of the first to manipulate colour with an exquisite sense of harmony. At the Ecole des Beaux-Arts he reproduced the *Loggi di Rafaele* in the *galeries*, and decorated the porticos in the Cour-du-Murier with paintings in a Pompeian style. Variegated marbles, glazed tiles, terra-cotta, and naked iron had been used by him with truth and logic. Constant-Dufeux also produced colour decorations refined, harmonious, and effective. The diocesan architects sought to restore to the great religious edifices their ancient colouring, and in some cases with success. In the villa Louis Duc had built for himself at Croissy, on a bank of the Seine, the colouring was a distant repletion of Oriental art, and there, both internally and externally, paintings and glazed tiles combined to produce a decorative effect as cultured as it was refined. After Italy, Greece, and the monuments of the Middle Ages, and the Renaissance, the East had supplied a conclusive argument in favour of coloured architecture, and for some time the East had been invading the West. Colour had extended itself within to without, no longer by superficial coats which would rapidly fade in damp climates, but under the form of coloured materials. The development of ceramics placed at the disposal of the architect a varied supply of solid materials. The Exposition-Universelle of 1867 gave prominence to the efforts of English aud French potters, while the *Azulejos* of the old Spanish monuments, the faïence coatings of the mosques at Cairo and Persia, and the decorations of the Indian palaces had exercised a sort of fascination easily accounted for. It was necessary to take these circumstances into consideration, in order to understand the marked reaction which then became manifest in favour of bright colouring obtained by the use of natural materials. M. Charles Garnier had introduced mosaics on a large scale in the Nouvel-Opéra, which had been a kind of revelation, and had borne abundant fruit. About 1872, after returning from Spain, M. Sédille himself largely employed terra-cotta and glazed tiles in combination with highly-coloured woods. From that time the use of terra-cotta and glazed tiles had become general both in France and England; indeed, in the latter country the efforts made to utilise the resources of the potter's art dated back to an earlier period. The Exposition-Universelle of 1878 gave a great impetus to the manufacture of ceramics; the façade of the Exposition, and the special pavilion of the Ville de Paris, equally attracted attention. As a proof of the renaissance of polychromy, M. Sédille mentioned many works executed in Paris, by Davioud, Ballu, and MM. Garnier, Vaudremer, and others. He, however, urged that it was no longer paintings which, as in the olden time, must constitute modern polychromy, but rather the coloured materials themselves which formed a part of the structure. This art had not, so far, been received with unanimous approval, and all the attempts hitherto made had not been equally satisfactory. But a misconception of colour ought no more to discourage one from polychromy than bad architecture ought to set one against good. Architects should serve a special apprenticeship to colour, study the laws of harmony, fathom its resources, and thoroughly understand the part it played, so as to avoid its abuse. Coloured materials, such as granite, marble, stone, metal, and wood, allied with terra-cotta, enamels, and all the fire-tested products, would render modern polychromy as lasting as the edifices of which it would be one day the inseparable adornment.

Mr. G. AITCHISON, A.R.A., referred to M. Paul Sédille as a personal friend, and said he was altogether an extraordinary man, not only an apostle of colour but an excellent landscape-painter and writer. He was a sort of apostle of a new architecture which was to come, not only in France but in this country and the whole of Europe. Mr. Aitchison then spoke of the Magasin du Printemps, and said that M. Sédille in construction brought his effects to the outside of the building and showed how iron, bronze, and metal work could be made harmonious with each other and in colour. It was most interesting, Mr. Aitchison said, to hear that the whiteness which once overspread everything in the land had disappeared. M. Sédille, when here, was delighted to see how far advanced we were over French architects in the use of gold mosaic—mosaic on gold ground—and in enamelled pottery, and M. Sédille had been one who had strove to cultivate and foster the love of pottery. Mr. Aitchison accounted for the adoption of white by saying that the Roman buildings had been bleached by time, their gorgeous colour had disappeared, and the beautiful marbles, such as adorned the Temple of Faustina, seldom showed a trace of their grandeur except under the heaviest rain. A sight of the beautiful tombs and temples at Ravenna showed that the Romans were not wonderful admirers of white, and men who only delighted in proportions shown in white. The highly-coloured interiors, bright with bronze and gold, were still an evidence to the contrary. Mr. Aitchison made an allusion to the detailed drawings sent by M. Sédille and M. Garnier. The drawings might have been prepared for exhibition, but they were merely working drawings for their own and the contractor's use. M. Sédille had built several country houses in which he had introduced coloured, or, as the French called it, enamelled pottery. It seemed strange that we here, in the land of potters—in the land of Minton and Doulton—used so little pottery in the walls of our buildings. Few architects, even in country places of little importance, but had an opportunity of thus introducing a little colour at a trifling expense. Nature accentuated the complimentary colours in the pistils and stamens of her flowers. Nothing in nature was all white; nature used it slenderly and as a precious thing.

Mr. H. H. STATHAM proposed a vote of thanks to M. Sédille for his paper, who, he said, spoke in favour of constructive ornament. The climate here was against the use of pigments for exterior ornament, a mode of decoration that would also interfere with the monumental appearance sought to be impressed on our buildings. Restorations made of Greek buildings had not impressed him with the architectural judgment of the Greeks, if the suggested painting were correct. Speaking of blue metopes and red triglyphs, he said colouring of that nature would hardly add dignity to the Parthenon. It would show that the Greeks were not without shortcomings. An idea of a German writer was that the frieze was not covered

with crude colours, but was gilded first and painted afterwards, a theory which the writer said was borne out by traces found all over the building. Greek statues were idealisations, and not strict imitations of nature. The nearer nature was approached the more was the statue removed from the realm of idealisation, and therefore he could not see the objection to statues in white.

Mr. W. Dawson seconded the vote of thanks. He suggested the desirability of using more largely the various coloured stones which exist in our own country, which were possessed of most beautiful colours, and which hitherto had been too much neglected. He had lately seen the stations of the North-Eastern Railway Company constructed of stones of most lovely colour from quarries newly opened in Northumberland. The workmanship was admirable and the beauty of building in coloured stone was clearly illustrated. Cost of freight was comparatively cheap now, and it would be a great boon if architects would use such stone in the dreadful London climate. It would be carrying out M. Sédille's idea of introducing colour in the exterior of our buildings.

Mr. Hansard said he would warn anyone against using stone for colour before it had been tried in London. He had lately read a letter from Mr. T. N. Deane, of Dublin, who spoke of a stone he had found and had been using in Dublin, and which he believed, from that gentleman's knowledge, would equal the use of Portland stone in London. If this were true, they would greet their sister island's stone and use it.

Mr. John Hebb said he thought M. Sédille unduly blamed the polychromy of the churches in Paris, some of which he characterised as conspicuous failures. Mr. Hebb said failure was not the result of the imperfect application of a good principle, but was due to the attempt to carry out an impossibility.

Professor Kerr said a specimen of glazed stone produced by Mr. Cliff, of Leeds, had been lately sent him. The question of glazing, as a means of keeping a building clean by rain, was no new one. The merit of the contrivance was that the glaze was produced at so low a temperature that the stone was not injured. If he was right, it was done by a portable oven set up at the building in course of erection. It might be worth considering what the contrivance was worth, and if the glaze could be modified so as not to be too glaring. If it were found satisfactory, what Mr. Hansard was afraid of would not happen, as the surface of the stone would be protected and the colour brought out, and, by judicious design, a good effect would be produced.

Mr. J. D. Crace praised the great thought and delicacy of the external mosaics of the Trocadéro Palace at the exhibition of 1878. The interior work was not striking.

Mr. R. Phené Spiers said the subject divided itself broadly into two points: colour on ancient buildings, and what chance there was of adapting it to our own country. It was not exactly fair to judge by the drawings made and published in various works. These drawings had a partial glaze. Bright blue metopes and red triglyphs were not agreeable. This country was dull. In the East the brightest primitive colours, lit up by the bright eastern sun, showed none of the crudeness apparent in the drawings here. The Walhallah in the Black Forest district, erected in imitation of the Parthenon, of white marble uncoloured, it was impossible to look at at all under the sun; all proportions were destroyed. The sunlight, no doubt, required colour, and perhaps very powerful colour. The effect was not so gaudy as might be imagined in that dry and sunlit atmosphere. Under London skies a gay and bright surface was out of keeping, and nature very soon toned down anything of that sort here.

Mr. S. Vacher made some remarks on students and their opportunities.

A vote of thanks was then unanimously passed to M. Sédille and M. Garnier, and the meeting ended.

YORK ARCHITECTURAL ASSOCIATION.

THE opening meeting of the fifth session of the York Association was held on the 10th inst. at the Church Institute, under the chairmanship of the president, Mr. W. Hepper.

The annual report was as follows:—The Committee, in presenting their report of the work done during the fourth session, congratulate the members on the continued prosperity of the society. It now numbers fifty members, and the attendance at the lectures and excursions has been very satisfactory. During the past session the papers read have been interesting and useful. During the summer excursions have been made to many places of interest. The prizes offered by and through the Association, with the exception of one class, have not been competed for. The prize for the best design for a fireplace, with mantel and over-mantel, has been awarded to Mr. J. England Jefferson. The Committee whilst regretting the absence of competitors for the other prizes, testify to the general excellence of the design to which they have awarded the prize. The treasurer's report is satisfactory, showing that after all expenses have been paid, including a donation of 5*l.* 5*s.* to the local fund in connection with the visit of the Sanitary Congress to York, there remains a balance of 5*l.* 17*s.* 4*d.* in favour of the Association. It is a matter of great satisfaction to the Committee that Sir William Tite's prize of 30*l.* and certificate, in connection with the Royal Institute of British Architects, was won in competition by your secretary, Mr. B. Priestley Shires, for his design for a school of medicine and surgery. It is pleasing to the York Architectural students that one of their number has taken the National Gold Medal at South Kensington. It was won by Frederick R. Whitwell, for a design for a cathedral, and is the highest award taken by a member of the York School of Art; last year the silver medal was awarded to Edwin R. Tate, a member of our society, for drawings of a tomb in St. Crux's Church. Mr. E. Felgate, another member of the society, has taken the second prize in open competition for a design for "An Advertising Lamp." These successes, it is hoped, will stimulate our members to achieve similar results.

Mr. Wm. Hepper, the president, in the course of his address, contrasted the very much stronger position of architects in York since the society was established. There were now about fifty members, with every prospect of an increase, with a balance in the treasurer's hands, and it was acknowledged by the Institute of Architects. The main object which they had in view was to elevate the tone and character of the profession generally by combinations of members and associations, and thus effect an exchange of ideas on the subjects which were most interesting to them. The speaker strongly complained that there was no standard college for the training of architectural students, or any examination which was recognised by the professional bodies. If institutions were organised with that object it would greatly benefit the profession, as a considerable number of those who entered their ranks had obtained nothing like a sufficiently good education. He advocated students visiting and examining ancient churches, which would fully repay them. Warming and ventilation were questions which called for a great amount of study. They had hitherto been much neglected, which was partly owing to many of the inventions yet brought out being a failure. The matter would thoroughly repay a careful study. Though he spoke strongly of the preservation of our ancient buildings, any structure which interfered with the progress of the times he thought ought to give place to the new.

At the close a vote of thanks was passed to the President.

THE ROYAL SCOTTISH ACADEMY.

A MEETING of the Scottish Academicians was held on the 10th inst., Sir William Fettes Douglas, the president, in the chair. The following Council was elected for the ensuing year, as follows:—*Council*—Sir Wm. Fettes Douglas, president and trustee; Clark Stanton, J. M. Barclay, Gourlay Steell, D. W. Stevenson, Waller H. Paton, John Hutchison; George Hay, secretary and trustee; J. M. Barclay, treasurer and trustee; Wm. M'Taggart, trustee; John Hutchison and W. E. Lockhart, auditors; John Hutchison, librarian; Clark Stanton and J. M. Barclay, curators of library; J. M. Barclay, W. E. Lockhart, Otto T. Leyde, and W. D. M'Kay, visitors of the Life Academy.

At the statutory meeting of the Academicians held on February 10 last, J. L. Wingate and D. W. Stevenson were elected to the rank of Academician, to fill the vacancies caused by the death of J. A. Houston and E. T. Crawford. These elections and the death of John Glass have caused three vacancies in the rank of Associate. These vacancies were filled up by the election of the following artists:—Charles Martin Hardie, Arthur Melville, and James Hamilton.

The report submitted gave a *résumé* of the year's proceedings, which included a reference to the exhibition and its arrangement. The librarian and curators reported the addition of a number of art books and prints, &c., to the library.

The visitors to the Life School reported as follows:—"The session of 1885–86 commenced on November 2, 1885, and ended on June 25, 1886, having 120 morning and 121 evening meetings. The aggregate morning attendance was 2,355, or an average of 19 per morning; and 2,374 was the aggregate evening attendance, being an average of 19 per evening. The visitors have much pleasure in bearing testimony to the industry and good conduct of the students."

The Council are sorry to report that the students' work in colour does not maintain the high standard reached in recent years. While they cannot but express their regret that the paintings are not so satisfactory as they could wish, they are glad to be able to speak in terms of approbation of several of the drawings—those more especially to which the prizes

have been awarded, as in them is given evidence of more than ordinary artistic ability. It is gratifying to find that the Stuart prize has called forth a greater number of competitive works than last year, all of which, with marked individuality, indicate earnest effort after the qualities for which the prize was instituted. The Council, after careful examination of the studies, &c., awarded the other prizes as follows:—The Chalmers bursary, G. Denholm Armour; for the best drawing from the life, the late J. W. Lee;* for the second best, William Milne; extra prize for modelling, John S. Rhind; Keith prize, for the best work of a student in this year's exhibition, G. Denholm Armour and Duddingston Herdman—equal; Maclaine Watters medal, R. Haswell Donaldson; Stuart prize, P. A. Hay. The studies in water-colour from the life by John Briggs were considered worthy of honourable mention, and the competition design by D. B. Waters for the Stuart prize was highly commended. The following additions have been made to the Academy's collection of works of art, &c., during the past year:—(1) Bust of Thomas Duncan, R.S.A. (the original model), by Patrick Park, R.S.A. (presented by his widow, Mrs. T. Duncan); (2) *St. Bernard's Well*; (3) *Dunkeld*; and (4) *Hawthornden*, by Mrs. Cumming (the above three works bequeathed by the late Miss Mary Ann Cumming of Tullses, Forfar, and Tullses Lodge, Cheltenham, daughter of the artist); (5) *Wreck of the Wood*, diploma work of J. L. Wingate, R.S.A.; (6) *Bust in Marble of a Scotch Peasant Girl*, diploma work of D. W. Stevenson, R.S.A.; (7) *Portrait of William Brodie, R.S.A.*, by John Phillip, R.A., bequeathed by the late William Brodie, R.S.A. (this portrait has been placed for the term of three years in the National Gallery, in compliance with the desire of his representatives); (8) water-colour drawing of Roslin Chapel, by G. W. Kemp, architect (presented by W. Beattie Brown, R.S.A.); (9) "The Douglas Book," 4 vols., privately printed (presented by the Earl of Home, per William Fraser, C.B., LL.D.); (10) Catalogue Raisonné of William Miller's Engravings (presented by W. F. Miller, son of the engraver); (11) two photogravure artists' proofs of *The Queen's Favourite Dogs*, from pictures by Gourlay Steell, R.S.A., executed by Her Majesty's desire (presented by Gourlay Steell, R.S.A.). The thanks of the Council were duly transmitted to the respective donors. In accordance with the resolution of the Academy of May 31, the Water-Colour Exhibition intimated to be held during the summer and autumn months was postponed.

The Council regret exceedingly having to report that the proposal of the Academy to have a refreshment-room and a retiring-room in the Academy building, in connection with the annual exhibition, cannot be carried out at present. It is hoped, however, that apartments for these purposes may soon be obtained. For many years consecutively it has been the painful duty of the Council to record the death of one or more members of the Academy. They are glad, however, to be able to report that during the past year no losses have been sustained.

RESTORATION IN FLORENCE.

THERE has been in a quiet way a great deal of complaint, writes a correspondent of the *Times*, about the demolitions and plans for demolitions of the old parts of Florence, mainly coming from the lovers of the picturesque—*i.e.*, the shabby and dilapidated, the fungoid developments on the old architecture. Most of this is senseless—so much of it, indeed, that none of it receives any attention from the authorities concerned. The taste which confounds the old with the beautiful, and the charm of accidental overgrowth or aggregation with that of pure architectural effect, cannot be depended on to advise what shall be done in the way of restoration. The best view of any noble building, from the purely artistic side, is unquestionably that which the builders conceived, and that is, of course, the condition in which it was seen when finished; and the marks of age and decay, the dilapidation and crumbling line which the modern school of landscape painters delight in, have no place in pure architecture. The dilapidated sheds of the old market in Florence, the rows of shops on the Ponte Vecchio, and the aggregations of vegetable growth and lichenous stains on the old buildings awaken no kind of tender regard in the commissions for the restoration of the old monuments. The old market, with the picturesque effects of light and shade, is swept away, with its garbage and stench, and for the bettering of public health. The ambitions of the reformers go further, and aim at the entire demolition of the buildings which skirted the old market-place towards the Duomo, and the opening the Piazza out on that side so as to give a better distant view of the baptistery and Duomo from the west, and of course showing the new façade to better advantage. The Bigallo on this side has been restored now for some time, and, in spite of all that has been said against it, I must say that it is an excellent piece of work, restoring the building as nearly to its original condition as our present information will permit. It has not been renovated in any sense of being made to look new, but the old windows have been opened again, and the marble work of the front restored where damaged. It keeps its age perfectly.

The further demolitions in the old market quarter are regarded by the architect in charge, Signor Del Moro, with a good deal of diffidence. Here are, he says, some of the oldest and most interesting houses in Florence from the historical point of view, and we must proceed with the utmost caution, and with no preconceptions, to their treatment. "We must," he says, "consider all the conditions under which the great works of the old architects were constructed, and that, in all probability, the very restrained space in which they were built was planned for in their design, and by increasing the space around them we may seriously belittle them. In all these alterations we must move very cautiously." Nothing then can be off-hand determined concerning the enlargement of the Piazza in front of the Duomo, much less of the demolition of the Ghetto, which, as Signor Del Moro says, contains some of the oldest specimens of domestic architecture in Florence. The tasteless and unnecessary restoration of the house of Dante, which is made a new house from foundations up (so that, as the proprietor says, "We see it now as Dante saw it," supposing always that it was new when Dante lived in it, which is not at all likely), is an example of what to avoid in restoration. It is idiotic.

The Italian architects in charge of these works have converted me from an indiscriminate admirer of the old and an enemy of renovation to a view which foreigners must perforce accept, and which I hope the Italians will not exceed—the architects, so far as I know them, are not likely to—viz., that where there is a personal or autographic element in work it is not to be interfered with except where solidity demands it, but where the original intention of the architects is concealed by aggregation of materials foreign to its purpose or by decay of the material, it should be restored as exactly as possible to what it was originally. The house of Dante had no architectural value whatever, and the only thing the owner could have done for us was to prevent its falling down and give us the chance of seeing something which Dante's eyes had looked on, now impossible, for the house might as well have been built from the foundations in the nineteenth century. The Duomo, on the contrary, will be cleaned throughout as thoroughly as possible without going to the raw surface of the stone; and the campanile will follow suit, all the dirt being thoroughly removed and the architectural effect due to the intarsiata restored. It must be remembered that constant decay of the marble slabs has for a long time necessitated the renewal here and there of slabs of the intarsiata, and these are, therefore, in all stages of toning; but in these old restorations, it has often happened that samples of marble which do not well resist the influence of the weather have been introduced, and by their more rapid change, especially those of red marble, which are important in the design, have become an ashen grey. This can be seen in the campanile, and, wherever such pieces occur they will be removed, and more carefully selected pieces will be substituted. The reliefs, the carvings of the portals, windows, &c., whatever, in short, has any autographic value will be cleaned as thoroughly as brushes and water will wash, but in no case will the surface of the stone be interfered with. If any admirers of the effect of time are discontented with this they are likely to remain so, because the programme of restorations has been carefully considered, and will in all probability be adhered to, with such modifications as the change of *personnel* in the Opera may give rise to, immaterial in any case.

The Ponte Vecchio is one of the features of Florence which attracts most attention, and which has been most warmly contested against the restorer. There is no present intention of interfering with it in any way, but the gallery which connects it with the Uffizi, and which, like the Ponte Vecchio, was once filled with shops, wedged between its piers and hiding its arches, is restored to its original condition of an open arcade along the river, with most admirable architectural effect; and this work will one day be continued along the bridge, to the demolition of the jewellers' and bric-à-brac shops which are now so picturesque a feature, but which destroy absolutely the original character of the bridge, and interfere with its legitimate purposes. The gallery connecting the Uffizi and Pitti palaces is an historical feature, and is besides a distinct architectural element, though not of the original design, of the bridge, and as such will be preserved; but the shops, which are excrescences, however picturesque, and utterly alien to the

* The Council cannot refrain from expressing regret at the death of this student, which took place accidentally by drowning at his native town, Aberdeen, on August 29. Mr. Lee went through the course of tuition in the School of Art there, and gained admission to the Academy's Life School only two years ago, in which he worked with great industry, making rapid and decided progress, and giving excellent promise of attaining proficiency and distinction in the future. His untimely loss is regretted by all who knew him.

uses of the structure, will be weeded out, and I believe that the architectural effect of the view on the river will be more noble when the arcade is disengaged from this filling in, just as it is improved by the arcade on the Lung' Arno. Present visitors who hold to the shops, however, will not be annoyed by their removal, which will be at some undetermined future, unless the pressure of traffic demands an early clearing of the bridge, which now is crowded at times, and gives no place for pedestrians, the footwalk being occupied by the shops.

The next work to be undertaken when the Duomo is out of hand will be the Baptistery, the ceiling of which will be restored, the mosaics being in a most dilapidated condition, repaired by painting on bits of wood, canvas, &c., the Church having had little respect for the monuments in its charge, probably esteeming the money better spent in masses. Wherever one goes in Italy, the indifference of the ecclesiastical authorities to the condition or preservation of the works of art entrusted to them is most striking, and the Baptistery is one of the worst cases. With this the Or San Michele will be taken in hand, and, it is to be hoped, with restoration of the windows. The church of San Filippo in the Piazza Sta. Trinità is also at present being repaired, and some interesting old paintings have been recovered in a badly defaced condition from the whitewashing, which was the usual ecclesiastical method of restoration for the frescoes.

EDINBURGH ARCHITECTURAL ASSOCIATION.

THE opening meeting of the session was held on the 11th inst., when an address was delivered by the president, Mr. Blanc. In the course of it he remarked that twenty-eight sessions had passed since the Association was instituted, and that it could now lay claim to be the most prosperous of all the like institutions out of London. It was one of the three oldest in the country, and had a membership nearly double that of any other of those associations. Through varying conditions, with a fluctuating exchequer, many means had been tried to consolidate the Society by securing a permanent abode. That object, however, at no time interfered with the Society's main work, for he found a further advance by the inauguration of a sketch-book, fixing in representation the fast-mouldering remains of Scottish architecture; next, the systematic visitations to places of architectural interest in their neighbourhood; and later, they found themselves abreast of the times by the establishment of classes for the consideration of design and construction. The President afterwards spoke on "Scottish Ecclesiastical Architecture." He said that in Scotland, as elsewhere, wood and wattles might have in early times supplied the necessities of certain colonies and cell-builders, until in the sixth century the Roman fashion of building in stone was adopted. The early churches in Scotland bore strong marks of Irish influence, and the Scandinavian examples also seem later to have been followed. With the Norman conquest a train of good for arts and learning advanced northwards. Large tracts of land in the Lothians ceded to Scotland were colonised by new lords and their followers, and quickly a new and more fervent expression of religious feeling spread over Scotland, as in England. Religious communities from France were not slow to journey with the tide, and they found a great church-building period begun. Its period of activity lasted upwards of two hundred years, during which time architecture in Scotland followed closely the lines of the sister kingdom of England. Lands, under new partitions, were freely given over to the clergy, who were thus enabled to devote themselves to the erection of edifices which, if not so liberal in scale of magnificence, were at least in equal proportion to the more favoured conditions in England. When Margaret became the wife of Scotland's king she set herself to stir new enthusiasm in the clergy. Her influence was powerful and effective. Still leaning to English forms, she sought to assimilate to them the Scottish Church. Scotland doubtless received direct influence from France during this period of church building. Her chief associate and tutor, however, was England. Scotland's works of the twelfth and thirteenth centuries were unquestionably her best efforts. In them they found exhibited an equal knowledge of the prevailing style, and power in treating it, that was shown in England. A peculiarity distinguishing the Scottish churches was their extreme narrowness compared with their length; St. Magnus Cathedral, Dunblane, Dundrennan, Glasgow, and Arbroath were all very long, and in this they more nearly resembled the proportions of French than English examples. As an example of purity of style, graceful proportion, and scholarly simplicity, they had Glasgow Cathedral, sometimes called the "Scottish Salisbury." In treatment, however, it was markedly different from its assumed prototype. No transepts, no flying buttresses, finials, or other excrescences so prominent at Salisbury were seen in Glasgow Cathedral. There all was simplicity, the interior effect, of solid and simple design, being more emphatic in this respect than the exterior. For some years longer Scotland was enabled, under peaceful influences and royal encouragement, to pursue the development of her civilisation and arts. The death of Alexander III. in 1286 brought these restful and peaceful times to a sudden check. For upwards of a hundred years Scotland suffered under the fierce contentions of a disputed succession. There was no advancement in art, and the hitherto quiet march of learning and social refinement was obstructed. With quieter times art blossomed forth anew. Scotland then, in a state of uneducated manhood, was left to begin upon her own art traditions. This her works show she did, and in doing so she began her new art industry from the period of its cessation, and may have incorporated here and there some of the minor features concurrently expressed in England or France, and with which renewed intercourse may have made her artists acquainted. But wholesale imitation of the forms of plan or detail of any of these countries was not found in Scottish work. Her art had become as decidedly her own as her independence; and, true to the national characteristics, the strength and vigour exhibited in all the examples was particularly noticeable. They miss the delicacy of refinement and purity of the thirteenth-century efforts, but the new forms had the merit of originality, which longer study would trim to more pleasing expression.

At the close a vote of thanks was awarded to the President for his address.

THE CHURCH HOUSE.

THE executive committee appointed by the general committee for the erection of a Church House as the Church of England memorial of the Queen's Jubilee, at the meeting in Lambeth Palace library on October 18, held its first meeting on Friday last, the 12th inst., in the Jerusalem Chamber, Westminster Abbey, by permission of the Dean of Westminster.

The meeting was attended by the Archbishop of Canterbury (in the chair), the Duke of Westminster, Earl Stanhope, the Bishops of London and Carlisle, the Right Hon. the Lord Mayor, and twenty-six other members of the executive committee, a full list of which is given below.

The Archbishop of Canterbury was elected chairman, and the Duke of Westminster and the Bishop of London vice-chairmen of the executive committee.

The question of recommending to the general committee a modification of the scheme by the inclusion of other objects than that of erecting a Church House was very carefully considered at great length, and in all its bearings; but while the warmest sympathy was expressed with some of these proposals, it was decided by a large majority that it would be undesirable to depart from the plan already agreed on for the Church's commemoration of Her Majesty's Jubilee. After a prolonged and careful discussion the following points were unanimously decided upon:—

1. That it is desirable to secure a site in a good and accessible position sufficiently large to allow for the erection of a building which shall ultimately be adequate to all the purposes which a Church House is intended to fulfil as a centre of Church life and activity. It was, moreover, considered desirable that the scheme should include a chapel.

2. That the aim should be to collect funds for the erection of rooms sufficiently large for the meetings of the Upper and Lower Houses of the Convocation of Canterbury, and the House of Laymen, regard being also had to the possibility of a joint session of the Convocations of the two provinces and of the Houses of Laymen when duly constituted, a chapel, several committee-rooms, and the necessary rooms for a secretary and clerks. The immediate or more remote erection of a large hall and any further additions that may be required to depend upon the funds that are raised. That provision must also be made for the sustentation of the fabric by the investment of an adequate sum to yield an income for the purpose.

3. Sub-committees of site and works, with the Duke of Westminster as chairman, and of finance, with the Bishop of London as chairman, were appointed, which will respectively meet forthwith to examine and report upon suitable sites, and to proceed with the collection of funds. This report will be presented to the general committee for confirmation at its next meeting.

Executive Committee.—The Archbishop of Canterbury, the Archbishop of York, Bishop of London, Bishop of Carlisle, Dean of Westminster, Dean of Windsor, Dean of York, Archdeacon Farrar, Archdeacon Sumner, Archdeacon Watkins, Canon Cadman, Canon J. Erskine Clarke, Canon Gregory, Canon G. Venables, Prebendary Billing, Prebendary Ingram, Rev. J. T. Brown, Rev. J. Troutbeck, D.D., Rev. R. T. West, D.D., Duke of Westminster, K.G., Earl Stanhope, Lord Brassey, Right Hon. W. H. Smith, M.P., Right Hon. Sir J. R. Mowbray, M.P., Right Hon. Lord Justice Cotton, Right Hon. J. G. Hubbard, M.P., Right Hon. G. Cubitt, M.P., Right Hon. A. J. B. Beresford-Hope, M.P., Right Hon. Sir H. Selwin-Ibbetson,

M.P., Right Hon. the Lord Mayor, Sir James M'Garel-Hogg, M.P., K.C.B., Sir Walter G. F. Phillimore, D.C.L., Mr. G. Baden-Powell, M.P., Mr. H. Hucks Gibbs, Mr. Mark Knowles, Mr. P. Vernon Smith, Mr. R. Bosworth Smith, and Mr. G. A. Spottiswoode.

Hon. Treasurers.—Mr. George T. Biddulph, the Hon. H. D. Ryder, and the Hon. Edward Thesiger, C.B.

Hon. Secretaries.—The Rev. R. Milburn Blakiston, the Rev. William Sinclair, and Mr. Fred. A. White.

"*Antiquity after a time has the grace of novelty.*"—Hazlitt.

THE ACT FOR THE REBUILDING OF LONDON AFTER THE GREAT FIRE.

When a fire broke out about ten o'clock on a Sunday night, September 2, A.D. 1666, in a bakehouse in Pudding Lane, it could not have been anticipated that it was to cause the destruction of London. On the next day John Evelyn took his wife and son to Bankside, and by that time "all the houses from the bridge, all Thames Street, and upwards towards Cheapside down to the Three Cranes were consumed." This will give a notion of the ease with which the buildings caught fire. The season had been dry and there was a fierce eastern wind: the power of the fire was therefore increased. Moreover, the people appeared to be panic stricken. "The conflagration was so universal and the people so astonished," says Evelyn, "that from the beginning, I know not by what despondency or Fate, they hardly stirred to quench it, so that there was nothing heard or seen but crying out and lamentation, running about like distracted creatures without at all attempting to save even their goods, such a strange consternation there was upon them."

By the 4th the fire had extended as far as the Inner Temple. Fleet Street, the Old Bailey, Ludgate Hill, Warwick Lane, Newgate, Paul's Chain, Watling Street were reduced to ashes, the lead from St. Paul's Cathedral was flowing in molten torrents, and the stones were flying "like granados."

For two days the fire was a novel spectacle to the fine ladies and gallants of the Court, but on the 5th there were signs that the flames cared little for the divinity that hedged a king, as they were making their way towards Whitehall, whereupon there was a confusion that the loyal Evelyn dared not reveal. He was asked, with others, by Charles II. to do something towards quenching the fire, and Fetter Lane was assigned to him for operations. But the only men who seemed of use at the time were some sailors. They could have saved a great part of the City if they were allowed to pull down or blow up a few houses here and there, but the worthy aldermen and City fathers would not allow their property to be sacrificed.*

Fortunately the wind abated. As it was, over thirteen thousand houses were destroyed, with eighty-six parish churches, and fifty-two halls of companies, besides other buildings. The loss was estimated at about eleven millions sterling. On the 7th Evelyn was unable to see, during a walk of five or six miles, "one load of timber unconsumed nor many stones but what were calcined white as snow." The few people met were "like men in a dismal desert," for it was impossible to make one's way unless by such landmarks as a ruined tower or pinnacle. That was Evelyn's way of representing the catastrophe. The Dean of Rochester on the following Sunday expressed it in a pedantic way by telling his congregation that "the City was reduced from a large folio to a decimo-tertio"!

Forty years afterwards Woodward, the Professor of Physic, gave it as his opinion that the fire was a beneficial if a terrible remedy. In consequence of it, he said, provision was made for sweetness, cleanness, and salubrity, and London became the healthiest of cities. Hume, who is almost the only historian who condescends to notice the rebuilding of the City, is of the same opinion. "A discretionary power," he says, "was assumed by the king to regulate the distribution of the buildings, and to forbid the use of lath and timber, the materials of which the houses were formerly composed. The necessity was so urgent, and the occasion so extraordinary, that no exceptions were made to an exercise of authority which otherwise might have been esteemed illegal."

There were regulations for building in force within the City walls, but the Great Fire was made the occasion for drawing up a Building Act (19 Car. II., cap. 3) with some claim to comprehensiveness. The provisions of this document are not generally known, and the following abstract of them may be worth a place among "Bygones":—

No house for habitation shall be hereafter erected within the limits of the City of London but such as shall be pursuant to such rules and orders of building, and with such materials, as are herein mentioned: and if any presume to build contrary thereunto, the house so irregularly built shall be deemed as a common nuisance, and the builder to enter into a recognisance to demolish the same in convenient time, or otherwise amend the same according to the said rules; and for default of entering into such recognisance to be committed to the gaol without bail or mainprize till he demolish or amend the same, or else the Court of Aldermen may demolish the same.

* * *

The Lord Mayor, Aldermen, and Common Council of the said City shall and may nominate and appoint one or more discreet persons, intelligent in the art of building, to be surveyors to see the said scantlings well observed, and give them an oath for the true execution of their office in that behalf.

* * *

There shall be only four sorts of buildings, and no more. The first and least sort, fronting by-lanes: the second, streets and lanes of note: the third, high and principal streets: the fourth and largest, mansion-houses for citizens or persons of quality.

* * *

The Lord Mayor and Aldermen and Common Council shall resolve before the 1st of April next which shall be accounted by-lanes, which streets or lanes of note, and which high and principal streets, and the same to be marked or staked out, that the extent may be known. And if any person pluck up or remove the same without lawful authority, and be thereof convicted, he shall be sent to the common gaol for three months without bail, unless he pay ten pounds: but if the offender be unable to pay the ten pounds, then the said offender shall be whipped near the place where the offence was committed, and the justices of peace out of the pecuniary mulcts may reward the informer.

* * *

All outsides of buildings shall be made of brick or stone, or brick and stone together, except for door-cases and window-frames, the breast-summers, and other parts of the first storey to the front between the piers, which at the discretion of the builder may be built of oak for conveniency of shops.

* * *

The surveyors shall take care party-walls and party-piers set out equally on each builder's ground to be built up by the first beginning of the building, and toothing left in the front wall, and that no man be permitted to build on the said party-wall until he hath reimbursed the first builder the full moiety of the charges of the said party-wall and piers, with interest at six per cent. for forbearance; and in case of difference the Alderman of the next Ward to mediate an agreement, and where he cannot do it to appeal to the Lord Mayor and Court of Aldermen to hear and determine the same.

* * *

Houses in by-streets or lanes shall be two storeys high, besides cellars and garrets; the cellars to be six foot and a half, if the springs of water hinder not; the first storey nine foot high from the floor to the ceiling, and the second the like: that all walls in front and rear be two bricks in length thick, and thence upward one brick and a half. The thickness of party-walls between houses of the first and lesser buildings be one and a half as high as the garrets, and in the garrets one brick in length at least.

* * *

The second sort of building fronting high streets and lanes of note, and the river of Thames, shall have three storeys besides cellars, which are to be six foot and a half high; the first storey ten foot from the floor to the ceiling, the second the like, the third nine foot: the walls in front and rear to the first storey to be two bricks and a half, thence upwards one and a half. Party-walls two bricks lengths as high as the first storey, and then upwards one brick and a half.

* * *

Buildings fronting high and principal streets shall consist of four storeys, besides cellars and garrets as aforesaid; the first storey from the floor to the ceiling ten foot, the second ten foot and a half, the third nine foot, the fourth eight and a half: the front and rear walls to the first storey the thickness of two bricks in length; and thence upwards one brick and a half. The party-walls to the first storey two bricks in length, and thence upwards one brick and a half.

* * *

The fronts of houses in high streets shall be balconies four foot broad, with rails and bars of iron, to contain in length two

* According to what was said by the Duke of York (afterwards James II.), it was an old woman who suggested the plan of blowing up houses by gunpowder in order to form gaps.

parts of the front, and the remaining vacancy to be supplied with a penthouse, to be covered with lead, tile, or slate, and sealed underneath; and the water falling from the tops of the houses, balconies, and penthouses be conveyed in party-pipes to the channel; and under the balconies and penthouses pavements to be made of broad flat stone.

* * *

No builder of houses fronting high streets shall lay his first floor over the cellar more than eighteen inches above the streets, or less than six, with a circular step to lead thereto; and no trap-doors to be suffered, nor any open grates or lights but upright; and that no bulks, jetties, windows, posts, or seats shall be made in any streets, only in high streets stallboards may turn over eleven inches and no more, when shop-windows are open.

* * *

And if any persons, bodies politic or corporate, seized or possessed of any ground built upon, and the houses now burnt in the late fire, shall not within three years next build up the same, that then the Mayor, Aldermen, and Common Council of London may make public proclamation between twelve and two in the afternoon, as well upon the ground as the Exchange, to give notice to all persons to rebuild within nine months then next following: and in case of neglect or refusal, the said Mayor and Aldermen may cause a jury to be empannelled to inquire and assess the true value of such void ground, and after such inquiry and valuation to sell the fee or inheritance thereof by conveyance under their common seal to any that will purchase the same at the price so valued, and the money thereupon due to be paid to the Chamber of London, and thence to be paid by the Chamberlain to such persons who have any estate in the same: which sale so made and enrolled, according to the custom of the City, shall be final to all others, and bar them, their heirs, &c.

* * *

That in case of combination, &c., or exaction by brick-makers, tile-makers, and lime-burners, the justices of the King's Bench, or any two of them, upon complaint of the said Mayor and Aldermen, may call before them such number of brick-makers and lime-burners as burn or make bricks, tiles, or lime within five miles of the Thames, and, upon conference with them had, assess such reasonable prices of the several kilns, and also of all carriages by land or water, as may respect the honest profit of the said brick-makers and the necessity of the builder.

* * *

That the justices of the Court of King's Bench, or any two of them, upon the like complaint of the Lord Mayor and Aldermen, may limit, rate, and appoint the wages of brick-makers, tile-makers, lime-burners, carpenters, bricklayers, masons, plasterers, plumbers, or other artificers, workmen, or labourers by the day, week, or otherwise, and what wages they shall have by the great, by the foot, yard, rod, or perch; which rates, set in a table, and proclaimed, shall bind all persons therein concerned. And if any refuse to set to work for the wages so assessed, or depart from his work without license of such as employed him, unless for non-payment, or if any underhand agree to give greater wages, the said offenders, legally thereof convicted, shall by the justice be committed to the common gaol for a month, unless he pay such fine as the justice shall impose, not exceeding ten pounds, out of which the injured party to be satisfied, and the rest to be employed towards the public buildings of the City.

* * *

Carpenters, bricklayers, masons, plasterers, joiners, and other artificers, workmen, and labourers to be employed in the said buildings who are not freemen of the said City shall for seven years next ensuing, and till the said buildings shall be finished, have the same liberty of working as the freemen of the City of the same trades; and after the said seven years, shall have the same liberty to work as freemen during their lives, paying and performing all such duties as freemen are liable to.

* * *

All differences about stopping of lights, windows, or water-courses may be determined by the Alderman of the Ward; and if he cannot determine the same, then the Lord Mayor and Aldermen to determine the same without appeal.

* * *

The numbers and places for all common sewers, drainers, and vaults, and the manner of paving and pitching the streets, shall be designed by such persons as the Lord Mayor, &c., shall appoint, who together with the surveyors have power and authority to direct the making of any new vaults, sinks, or common sewers, and to impose any reasonable tax upon houses, according to the benefit they shall receive, towards the same. And in default of payment of the same charged, the said persons so authorised, or any seven of them, by warrant under their hands and seals, may levy the said sum by distress, &c. And all other commissioners are suspended within the said City and liberties thereof for seven years, and till the buildings are finished.

* * *

All corner-piers of stone or brick to be erected shall be of the dimensions mentioned in the former Act. But builders may use, instead of brick or stone, a substantial post of oak timber of such dimensions as the City surveyors shall appoint.

* * *

No builders shall be permitted to lay their foundations till the surveyors have viewed the same and seen the party-walls equally set out; and then the builder shall repair to the Chamberlain of London, and there enter his name, with the place where his building is to be, and pay down to the said Chamberlain six shillings and eightpence for every foundation, after which, in three days the surveyors shall set out the foundations accordingly: and all builders who have already laid any foundations shall pay to the Chamberlain aforesaid six shillings and eightpence; and in default thereof, the Chamberlain may sue for the same.

* * *

No houses built upon the site of the houses burnt by the fire shall, after the rebuilding, be liable to any encumbrances whereto the same might be liable by any matter or thing before the said late fire.

Who was the author of the Building Act of Charles II.? Tradition has assigned the office to Sir Christopher Wren, but the evidence is only of a circumstantial kind. The practical knowledge and good sense seen in the clauses are the grounds on which the claim is based.

It will be seen that an effort was made to prescribe buildings of a more substantial mode of construction than hitherto prevailed. More would have been done if there was less limit to the King's power in Parliament.

One advantage arose from the new Building Act. London used to suffer periodically from plague, and the year before the Great Fire over 100,000 of the inhabitants perished from that disease. But London, since its rebuilding, has been free from that calamity. Sanitarians have, therefore, some reason to be grateful to the "Merry Monarch."

Correspondence

Architectural Restorations and Modern Practice.

Sir,—One of your daily contemporaries has published some letters from Florence describing the restoration of the Duomo, and referring to the storm of censure that assailed those engaged in similar work at Venice a year or two ago. It is a trite saying that we should learn wisdom from the past, and it appears to me that these letters invite us of this northern clime to take its lessons to heart.

Does it not seem as lamentable as it is extraordinary that in this country—the inhabitants of which are always credited with a just appreciation of the practical—we should persist, without the slightest necessity or excuse, in the use of materials for our façades so utterly unsuited to our climate that, instead of centuries, as in Italy, only months are required for their destruction? If from some lamentable cause we feel compelled to give constant employment to our masons, we could not do better than build as we do. Public structures have to be restored twice in a lifetime at a cost of many thousand pounds, and in our case a little fortune has to be spent annually on repairs.

The only excuse for continuing the absurd practice of building in London with perishable stone is that it is so soft that it admits, at small cost, of abundant ornamental carving, and that if this soon decays it can easily be repaired. That is the case of the architects and builders. But the question remains—What would the British taxpayer say if the case were properly presented to him? Would he prefer to have ornamental buildings, always in a state of costly restoration, to simpler edifices of equal, though different, architectural beauty never requiring repair? The answer, I venture to think, is as obvious as certain. It is to be hoped, then, that with the building of the new War Office an end will be put to the necessity for the restoration of public buildings in English cities by the use of a material suited to their abnormal atmosphere of destructive gases.

The proofs of the possibility of this are numerous. But to take one only. Within bowshot of Westminster Abbey are two structures. On the one hand you have the Houses of Par-

liament; on the other the Crimean monument. The first is of limestone, which is constantly under restoration, at a cost of 2,500*l.* annually; the last is partly constructed of an igneous rock of great beauty, which has suffered no change whatever from twenty years of exposure. In the use of the durable material there is no question of extra cost. An appropriate granitic treatment of architectural style would not be more expensive than the customary elaborate carving and moulding of soft freestone, including the outlay on its periodic restoration.

It is scarcely necessary in your pages to urge that the splendours of ancient architecture were intimately connected with the use of materials remarkable alike for their durability and beauty, but it scarcely seems to be realised, as yet, that within the limits of the United Kingdom nature has been almost as bountiful in this respect as in Egypt, or Greece, or Italy. The only misfortune is that at present their use is limited to a portal or a column here, to a pilaster or a panel there. It is extending, however, and my conviction is that the architect will make his mark, so to speak, who shall erect the first complete city edifice in which perishable and fuliginous freestone shall be conspicuous by its absence, but instead thereof burnished walls of white Cornish elvan, with details of pink and gray granite and green porphyry.—Your obedient servant, AN OLD ARCHITECT.

CHURCH BUILDING AND RESTORATION.

London.—St. Stephen's Church, Battersea, is the ninth of the churches to be erected under the Bishop of Rochester's Ten Churches' Fund, and is situated at the corner of Bridge Road and Kersley Street. The building, which may be termed a brick church, is designed in the Decorated style, with simple telling details, advantage being taken of different colours of materials for effect. The internal walls are finished throughout with picked stock-brick facings of a good deep colour, with moulded red-brick arches, strings, labels, jambs, &c., most of these moulded bricks being specially made to the architect's details by Messrs. Lawrence & Son, of Bracknell. The tracery of windows, caps, bases, and other stonework are in Monk's Park stone, with red Ancaster stone shafts to nave arcade. The roofs throughout are close-boarded, stained, and varnished. The floors are of wood-block paving; seating in nave and aisles in pitch pine; choir stalls, pulpit, screens, and sanctuary fittings in English oak. The exterior of the building is finished in picked stock facings, relieved with red-brick dressings. The roofs and spire are covered with Broseley tiles, specially-designed tiles being used for ridges, &c. The church is built to accommodate about 700 people, with a large parish-room, offices, and vestry beneath. The cost has been about 4,600*l.*, including tower and spire, narthex, boundary walls, fittings, &c., complete—a comparatively small sum. The work has been carried out from the designs and under the superintendence of Mr. Wm. White, F.S.A., by Messrs. Holloway Bros., of Queen's Road, Battersea, S.W., Mr. T. W. Barry acting as clerk of works.

GENERAL.

The Aberdeen Artists' Society's Exhibition in the Schoolhill Galleries, which was opened on Monday, August 2, was closed on Saturday evening. Pictures were sold to the value of about 1,000*l.*

The Collection of Works of Art bequeathed by the late Mr. Joshua Dixon, of Winslade Park, may now be seen at the Bethnal Green Museum. It comprises many valuable water-colour drawings, besides oil-paintings, and sculpture in marble and bronze.

Mr. James Sellars, I.A., of Glasgow, read a paper on "Every-day Architecture" at the last meeting of the Dundee Institute of Architecture. In the course of the paper he said that more than one-half of the plans which went before the Glasgow Dean of Guild Court were signed by persons who had no claim to be called architects, and who did not so designate themselves in the City Directory.

Mr. W. Leiper, F.R.I.B.A., delivered a lecture on architectural study at last week's meeting of the Glasgow Architectural Association, in which he advised students to draw often and draw well, as the disadvantage Scotch architects labour under in the lack of all academic instruction in architecture, either practical or as a fine art, could be best minimised by the careful study of the works of the past with the aid of pencil and measuring rule.

The Roman Catholic Cathedral at Pittsburgh, Pennsylvania, U.S., was burnt down on last Saturday morning. It was one of the finest churches in the country. The fire is reported to have originated from an explosion of natural gas which supplied a stove.

Lord Aberdeen (the late Lord-Lieutenant of Ireland), while regretting that the pressure of many direct claims hinders him from sending a more substantial amount, has forwarded a cheque for three guineas in aid of the Science and Art Classes of the Dublin Mechanics' Institute.

The Plans of Messrs. Darbyshire & Smith, of Manchester, have been approved for "Old Manchester and Salford" at the forthcoming exhibition. Messrs. Maxwell & Tuke report marked progress in the ironwork of the buildings in general.

Mr. C. F. L. Horsfall, of Halifax, has been awarded the first premium in the competition for the Elland Town Hall.

Mr. F. J. Clarke having determined to discontinue his prize of a gold medal to the Lincoln School of Art, Mr. Sharpley Bainbridge has offered to continue the gift.

Mr. G. F. Watts, R.A., intends leaving for Egypt at the end of next week, to pass the winter.

Plans to the number of seventy have been sent in, in competition for the proposed hospital for West Renfrewshire. Six sets have been selected for further consideration.

Mr. S. Denman, of Brighton, has obtained first premium in the competition for the Town Hall and offices at Lewes. The second premium goes to Mr. Mark J. Lansdell, of London and Hastings.

Mr. R. S. Marsh, of Cockermouth, has prepared plans for a Liberal club, to be erected in Station Street, Cockermouth.

M. Munkacsy, the painter, arrived in New York at the beginning of this week.

A Town Hall is proposed to be erected at Bromsgrove. Mr. John Cotton, of Birmingham, is the architect.

The Lighting of Ingestre Church by electricity has been just carried out.

The Birmingham Architectural Association held the first ordinary meeting, Mr. John Cotton, president, in the chair, on Tuesday evening, when a paper was read by Mr. Victor Scruton, hon. secretary, on "Poetry and Price Lists."

The Architectural Section of the Glasgow Philosophical Society held its opening meeting on Monday evening, when Mr. James Thomson, architect, delivered the presidential address.

The Kingstown Commissioners have resolved to erect artisans' dwellings in the township, according to plans prepared by Mr. Thomas Drew, R.H.A. The cost will be about 21,000*l.*

An Exhibition of Irish Industries will be held in an annexe of the Manchester Jubilee Exhibition next year, provided a sum of 3,000*l.* for the building is guaranteed by the Dublin Society.

Professor Sullivan will deliver the inaugural lecture at the Dublin Technical Schools upon an early date in January next.

Joseph Messner, the sculptor, has died of consumption at Oberndorf, in his forty-sixth year. He was brought up as a watchmaker, but having a talent for sculpture he was received as a pupil in the Munich Academy. In 1871 he was sent to Rome, where he remained for nine years, when he removed to Vienna.

The Metropolitan Board of Works propose to offer 58,000*l.* for the fields at Hammersmith known as Ravenscourt Park. A sum of 50,000*l.* was offered and declined. The local vestry will pay a moiety of the increased sum.

Mr. Edwin Arnold, C.S.I., author of "The Light of Asia," has addressed a letter to Sir Arthur Gordon, Governor of the Island of Ceylon, in favour of the restoration of the great Buddhist shrine at Buddha-Guya. It is now occupied by a college of Shivaite priests, who worship Mahadev there, and deface the shrine with emblems and rituals foreign to its nature.

A Meeting of the Worshipful Company of Plumbers was held on Wednesday at the Guildhall, Alderman Stuart Knill, Master of the Company, presiding, supported by Mr. F. Machin (Warden), Mr. W. H. Bishop (Renter-Warden), and Mr. George Shaw (ex-Master), for the further issue of certificates to plumbers passed by the committee of registration. Upwards of 200 master and journeymen plumbers from various parts of the kingdom were present. All the plumbers who presented themselves had complied with Clause 6 of the company's regulations.

Mr. F. R. Conder has been informed by the Metropolitan Board of Works that his iron process for the purification of sewage is not adapted to their purposes, and that they are not therefore prepared to adopt it.

The Architect.

THE WEEK.

The Imperial *régime* is recalled by the death of Eugène Petit, the flower-painter, who was employed on the decoration of Compiègne. He had only reached his forty-seventh year. M. Petit was a Parisian. Flower-painting can never gain high honours, and his only award was a third-class medal in 1873.

All the world has heard of the startling revelation of the appearance of the ancient Pharaohs by M. Maspero, but it was only on Friday last that he submitted a report on the unrolling of the mummy cloths to the French Académie des Inscriptions et Belles Lettres. It is evident from that document that there was a rivalry between M. Maspero and M. Brugsch, his co-conservator of the Boulak Museum. M. Brugsch wished to have the first peep at the ancient sovereigns, and, during M. Maspero's absence, he operated on Thothmes II., but it was found that the Arabs were beforehand, and the royal countenance was disfigured. Then an attempt was made on Queen Nofritari, but the embalmers had scamped their work, and it was necessary to bury the remains as quickly as possible. Operations were made on other mummies, and M. Maspero says he was in consequence compelled to interfere, in order to prevent the accidents which might ensue from a hasty unswathing. It is evident that M. Maspero does not consider that M. Brugsch holds a position sufficiently exalted for work of that kind, although his hands might be qualified to deal with the remains of plebeians. M. Maspero, therefore, resolved to gratify the Khedive by revealing what was left of a remote predecessor in the Government of Egypt—Rameses II.—and it was followed by the like performance on other kings and high priests. He was so far successful that the age of the individuals could be guessed. Thothmes II. was supposed to be under thirty years of age at his death. It is to be hoped that some day M. Brugsch may be induced to give his version of the story, for we fear that M. Maspero is not entirely impartial in his account.

Several of the pictures which Mr. Watts, R.A., has bestowed on the nation are now being exhibited in the Nottingham Museum. There are fifty-five works, including the *Fata Morgana*, *The Genius of Greek Poetry*, *Hope*, *The Birth of Experience*, *The Daughter of Herodias*, *Orpheus and Eurydice*, *Love and Life*, *Paolo and Francesca*. Among the portraits of celebrities are those of *Mr. Gladstone*, *Mr. Matthew Arnold*, *Mr. Burne-Jones*, *Mr. Calderon*, *Mr. Swinburne*, *Mr. Browning*, *Mr. William Morris*, *Sir F. Leighton*, with *Carlyle*, *Panizzi*, *Motley*, and *Stuart Mill*. The plan is adopted of publishing a penny guide to the pictures, containing explanatory criticisms. Something of the kind would be useful in most exhibitions which are intended to attract the humbler classes of visitors.

A meeting was held on Friday of the Society of Medical Officers of Health, to consider the draft of a proposed Bill for the registration of houses which certain amateurs in legislation desire to have introduced into Parliament. It may not be credited that the doctors opposed the scheme on the grounds mainly that architects were likely to become examiners if such a Bill were passed, and that as they are incompetent for such an office now they must always be so. Dr. Willoughby told the story of one of his patients, a most eminent architect, who went to expense in altering a house for his own occupation, but forgot all about the drains until diphtheria attacked his family, and the doctor argued that if the house had been let to a tenant, before the attack, a certificate of its safety would have been given, regardless of any examination of the drains. Dr. Corfield, whom the Institute of Architects has the privilege of counting among its honorary associates, was wroth against the scheme because the certificates of efficiency were to be given by his fellow members and members of the Institution of Civil Engineers. "I don't think," he said, "that anybody can deny that the vast majority of those gentlemen are entirely unqualified to give the certificates in question," and the doctor thought the certificates would not be worth the value of the paper they were written on. Dr. Blyth said that a trial was coming on about the demolition of houses in his district under Torrens's Act, and five or six architects will be forthcoming to testify that the houses are in the most excellent sanitary condition that is possible. The President was of opinion that many architects never saw a drain in their lives, and that the only competent examiners were medical officers like himself. This kind of stuff has been allowed to circulate too long, and it is time for architects to allow their forbearance to cease. There is only one way to put an end to it, and that is by speaking boldly of the blunders which medical officers of health commit every day.

The statement of the Chancellor of the Exchequer, which shows that the Government will oppose the renewal of the Coal and Wine dues, has caused much fluttering among the members of the various local authorities of the metropolis. When it is remembered that in the course of a century nearly ten millions have been laid out on public improvements, and that the money was raised on the dues, the stoppage of such a resource becomes alarming. Last year the dues amounted to about 450,000*l.*, and to find an equivalent will involve an additional taxation of about 4*d.* in the pound. It is needless to say that there are objections to the dues, for there never was a mode of taxation that was universally satisfactory. It may also be true that, from having such a resource, money is too freely raised and expended. But, looking at the long list of metropolitan improvements, can it be asserted that any one of the items was unnecessary? There is no city in which so few imprudent works have been undertaken as London. Moreover, many improvements are still desirable, and we think it will be found that the sudden stoppage of that source of income will be enough to impede works of the kind for a long period of time.

The late Viollet-le-Duc prepared plans for the restoration of the sculptured porch of the cathedral of Vaud, and the work was estimated to cost about 5,000*l.* The project was allowed to remain in abeyance; but the condition of the figures will no longer admit of delay. It appears that nearly 4,000*l.* is in hand, and the Government will supply the stone. What is now being considered is the kind of stone that should be employed. M. Assinare, Government architect, will have the charge of the work.

When the Tuileries Gardens were turned over to a legion of showmen, tumblers, and musicians for a part of the summer, the arrangement was viewed with apprehension by many. It seemed to be a forerunner to some great change in the place. Another stage is about to be reached, for it is proposed to erect a colossal monument of the Revolution of 1789, either in the centre of the gardens, or on the site where the palace of the Tuileries once stood. It is needless to say the former proposal, if carried out, will not only alter the character of the gardens, but take away much of their charm. In spite of all the variations of governments the gardens may be said to have continued in the form that was given to them by Le Nôtre. The alterations were few, and were principally those suggested by Robespierre, who, in imitating antique ways, ordered semicircular seats to be placed here and there, to accommodate the elders of the Republic as they watched the exercises of the youths who were to take their places. At present there is a fine perspective from the site of the palace to the Arc de l'Etoile, but if an object like the memorial intervenes, that view, which is one of the sights of Paris, will lose its effect. Nor is it evident why the gardens should be selected for the structure any more than the position in the Louvre courtyard was devoted to a statue of Gambetta. The Tuileries Gardens were not the scene of any important event in the history of the Revolution. The Revolution is already celebrated by the liberty which is afforded to everybody of enjoying the gardens throughout the year. Before 1789 the people were excluded unless on fête days. Would not a far better site be found in the garden of the Palais Royal, for it was there the spirits of the Revolution used to confer, and there Camille Desmoulins raised the cry, "Aux armes!" which was the prelude to the fall of the Bastille?

POLYCHROME DECORATION.

ANY of our readers who happened to be, a few years ago, in that part of Paris where the "Printemps" was being erected, will admit that they felt a good deal of surprise when a glimpse was afforded of the brilliant mosaic which exhibits the title of the building. At first it was natural to infer that a great part of what was shrouded by hoarding was embellished in the same way, and to suppose that the new building would be a marked contrast to those near, which were new and white. If the stranger inquired what so novel a building was intended to be, he was informed that it was to be a shop for ladies' dress; and, if he knew Paris, he must have recognised the importance, in a business sense, of having a name and a building that were alike unique. The Paris draper would be surprised at JULIET's question, for he is assured that prosperity depends in a great measure upon having a fantastic name for his house. He knows also that he must have novelty in other things as well as in his goods, and he is compelled, in consequence, to have recourse to the stratagems that are so truly described by M. ZOLA in his "Au Bonheur des Dames." When the scaffolding was cleared away, it was evident that in the "Printemps" the novelty was combined with good sense. Colour was only used on the exterior in such places as would serve to be an advertisement, and the iron construction which is the great feature of the interior might seem to be a device for allowing as much space as possible for the exhibition of goods. The area of the "Printemps" is much less than that of rival establishments, but it may be said that not a square inch is occupied by construction which could be spared. Whatever is to be alleged against iron as a building material, it cannot be denied that it saves space, and this property is fully exemplified in M. SÉDILLE's building.

It might be supposed that the architect would be satisfied with having produced a shop that is almost as characteristic of our time as a railway station, while it differs from structures of that class in the beauty of the work. The building may be examined on all sides, and it will be found that the architect's attention was given to the smallest detail, and that even a slab containing directions for the porters and carriers shows a designer's hand. But one of the remarkable things about Frenchmen is that they are not satisfied when they do something that is original in politics or art, and leave it to speak for itself. Like Chancery lawyers, they seek out some musty precedent for their work. The first Revolutionists tried to pose as the successors of antique Romans, and now we have M. SÉDILLE doing his best to prove that his drapery establishment is the legitimate representative of Greek and Roman temples and Mediæval cathedrals. That was the manifest meaning of the paper which was read at the Institute last week.

We cannot see there was any necessity for the effort. If the "Printemps" is beautiful, and serves the purposes of the owners by its convenience and attractiveness, what more is needed? The building is not a temple or a cathedral, and need not resemble either of those works. If precedent is indispensable, it should have been sought in the booths of the traders of a past age, and they had little that was architectural about them. M. SÉDILLE has not taken a booth for a *motif*, and if he considers he was free to choose in respect of form, why is he afraid of being independent in his use of colour? In such matters our time may well make a law for itself.

Besides, when authority is sought from the past all sorts of objections arise. M. SÉDILLE in his essay takes it for granted that there is no difficulty in accepting the restorations by the young gentlemen of the schools of Rome and Athens as veritable representations of the Greek and Roman temples in their pristine glory. With all our respect for the imaginative power of the students, we cannot suppose that their efforts are much better than would be the attempts of the literary students to restore some of the lost books of antiquity. There is no certainty about the colouring of the temples, and as every inquirer seems to have a theory of his own, it is impossible to say how far the stone was concealed by paint or another material.

M. SÉDILLE expended a good deal of pains in proving that colour was known in Europe during a great many centuries, an historical fact which, it may be assumed, was not unknown to the Fellows of the Institute. We may be enveloped in fogs in this country, but from time to time a little information from the Continent has reached us. M. SÉDILLE will therefore be gratified to learn that a few at least were already aware of the use of colour on Byzantine and Mediæval buildings, and that they had heard of a man named LUCA DELLA ROBBIA.

M. SÉDILLE was desirous to prove that France was the heir of the ages in respect of polychromy. But then the question arose, how was the succession broken when stone was left to its natural colour? M. SÉDILLE has a short and ready answer. According to him the evil was caused by BERNINI and the Jesuits, when they put forth white buildings as reproductions of those of Ancient Rome. If for the moment we assume that M. SÉDILLE is right, is not the explanation a satire on French scholarship and taste? For we must suppose that in the Augustan age of French literature and art, nobody was competent to explain the true character of ancient architecture. We have more respect for the men of that period, and we therefore offer another explanation.

The principal cause of the abandonment of wall-colouring at the time is to be ascribed to the influence of painters and sculptors. Colours used in that way had been falling into disuse; but when wall-paintings in which the figure was represented on a large scale became general, it must have been manifest that their effect depended in a great measure on the treatment of the surrounding parts. If the walls containing the picture were painted without any control from the figure-painter, his work was likely to suffer, and in most cases he would prefer a plain wall. Pictures on canvas or panel were produced in large numbers, and were presented to churches. They also helped to supersede the use of colour on walls. Tapestry was another cause of the decline of painted surfaces. In most cases the pictures and tapestries have been removed from churches, and the walls now appear bleak; but we must imagine what was the former state of the buildings when the walls glowed with the colour that was found in the paintings of a crowd of masters, for every village in Italy seemed to have painters among its residents. It is not necessary to discuss whether the colour was of the most appropriate kind; it is sufficient to know that the people preferred pictorial subjects in fresco or on canvas to conventional ornament.

The sculptors also must have hesitated when they thought of the contrast between their white figures and a coloured background. It is only necessary to look at any one of the small chapels in Notre Dame containing a white marble figure of an archbishop to discover how much sculpture can suffer when the walls enclosing it are painted with ornament. If the logic of art is accepted, statues should be painted when they are placed in positions of the kind; but as a rule the Renaissance sculptors were inimical to that mode of treatment.

It is to causes of this kind that we must ascribe the change in regard of colour, and they were in action before either BERNINI or the Jesuits appeared in the world. We are ready to admit that to the Frenchmen of his time BERNINI was a demigod. One act of his was sufficient to gain him such a position. He made a bust of King LOUIS, but there was a delay about the pedestal. Whereupon it was said that there was no need of one, for the whole world was too small a base for so great a monarch. BERNINI became still more sublime, for he wrote some verses, in which he asked what was the use of trying to find something to sustain so mighty a king, for he who supported the world wanted no support. After that, if the sculptor had asked the people of France to have black walls instead of white the request would have been carried out most joyfully.

M. SÉDILLE is not, we think, much more successful in his selection of a second cause. The Jesuits may be very convenient scapegoats when there is a historical difficulty about politics, for they are supposed to have more than human power, but they are not to be so easily used in architecture. We always thought that the Jesuits were disposed to imitate the owners of the Magasin du Printemps, and to employ whatever style of decoration or of architecture was believed to be most attractive to crowds of people, and the gaudiness that is said to be the prevailing characteristic in what is called Jesuit architecture is a proof of this.

Instead of being opposed to colour, they were lavish in its use, by means of marbles, metals, paint, gilding, &c. In this country the Order is free, and what do we find? In London there is a Gothic church because Gothic was supposed to be in fashion here. In Edinburgh the style is nondescript, for the church is a transformed shed, but the walls are covered with paintings. In Dublin, where Classicism was supposed to reign, the church is filled with sham marbles. Everywhere there is an adaptation to local circumstances.

In France if the Jesuits found a belief prevailing that white churches were in the best taste, they would be sparing in introducing colour. Unless we are mistaken, the church of St. Louis, now St. Louis and St. Paul, in the Rue St. Antoine, was their first important church in Paris. It is impossible to say what its original condition was, since it suffered much during the First Revolution. We suppose M. Sédille has heard of the medal that was struck for the laying of the foundation-stone, with its remarkable inscription, "Vicit ut David, ædificat ut Solomon," and which expressed the ecclesiastical estimate of the greatness of Louis XIII. When a king is said to build like Solomon much is expected from him, and Louis did not disappoint his eulogists. The marble in the church at present suggests that the building was not entirely white within. The church was completed in 1641. The works at St. Eustache had come to an end at that time, but there was no colour on the walls, although from the style it could be easily used. A few years afterwards (A.D. 1646) St. Sulpice was commenced without any provision for colour, and the same may be said of St. Roch, of which the first stone was laid in 1653. If M. Sédille will reflect he will discover that there was a need of "Apostles of Colour" long before a Jesuit was known in France. It might also be concluded that if the Jesuits were the introducers of white walls into Paris that would be enough to make the other churches blaze with colour. The Order was never in favour in Paris. This becomes plain from the memoirs of Pierre de l'Estoille. It is well, when treating a subject like the rise and fall of polychromy, to be accurate, and therefore we would suggest that M. Sédille is not always to be taken as a historical guide. An apostle may, we suppose, be excused from losing much time in researches of the kind. According to the official abstract, M. Sédille objects also to the solemnity of the architecture that was imported under the Grand Roi. That quality used not to be considered a defect in temples and churches, but we suppose that henceforth if solemnity interferes with polychromy it will have to succumb.

There are several cases where that occurred in Paris. Does M. Sédille believe that the walls of the Sainte-Chapelle in their present condition are calculated to inspire reverence? Does he consider that Saint Germain-des-Prés is made venerable by the striping of the columns, or that the paintings of Flandrin gain by the surrounding decorator's work? Does he admire the diapers made out of letters and fantastic things, and the strange colours that cover the walls of the side chapels in Notre Dame? If so, he has not taken a lesson from any of those buildings before designing his Magasin. M. Sédille has put colour in its right place, and has made it more effective by contrast, while in the churches we have named the decorators were allowed to have the upper hand. A better principle is fortunately applied in several of the new churches of Paris. No fault can be found with the Imperial church of St. Augustin, or with the less expensive but excellent church near the Invalides, where there is a good frieze by M. Lemeire. We are bold enough to say that a little chapel of ease at the back of the "Printemps" is a far more agreeable example of decoration than Viollet-le-Duc's in the Cathedral.

The early days of the revival of polychromy in Paris were not fertile in examples of ecclesiastical or secular work that were adapted to inspire confidence. If M. Sédille were to pass by Prince Napoléon's Pompeian villa on a few successive wet days, he would hardly be disposed to become enthusiastic over it. The coloured circus also assumes a woebegone appearance at such a time. Paint, like charity, can cover a multitude of defects; but it must be acknowledged that the attempt to create a new mode of architecture by its aid was not more successful with external work in Paris than in London.

There was an approach to a better state of things when the Paris opera house was constructed, although the building testifies to the truth of the architect's statement, that marble will not retain its beauty and polish in a climate like France. But in spite of that example, external decoration by means of coloured marbles or mosaics has not made much way in Paris. Indeed, if it had, there could not be so much wonder when M. Sédille's building was revealed, and the intention of the designer would be frustrated. In the use of colour, England has gone beyond France. As much was acknowledged by M. Sédille, for according to Mr. Aitchison, "he was delighted and amazed to find how advanced the English architects were in the use of glass mosaic and enamelled tiles, almost beyond those of France." If the almost were omitted, the words would come nearer the existing state of things.

When we were writing lately about Luca della Robbia we said, "If he were to arise again he would have to own that English potters have a claim to be recognised as his legitimate successors,"* and as regards the supply of means for external decoration England has little need to go abroad. We have better terra-cotta, better enamelled pottery, than the French, and we can have mosaic equally good, for in spite of M. Martin's praiseworthy efforts the French mosaicists must have recourse to Venice for tesseræ when they desire to do superior work. It will be said that the French have a finer eye for colour, but it must not be supposed that what will serve in France is equally adapted to this country. Care must be taken that we are not led to do extravagant things at the bidding of the "Apostles of Colour." There was no foreign drawing at the Institute that in subtlety of treatment surpassed some of those which Mr. Aitchison has from time to time sent to the Academy; but, to judge by his speech, he seems disposed to sink his own individuality before the superior sanctity of the two apostles. If so, it is to be hoped he may find few imitators. We have our own needs, and we should endeavour to accept the conditions that are around us. Mr. Phené Spiers very wisely pointed out at the Institute meeting that anything that is very brilliant is out of place in a city like London, and that is equally applicable to the majority of provincial towns. We cannot expect that French architects will get us out of our difficulty by displaying their attempts in Paris, which after all have had but a partial amount of success.

RICHARD WAGNER.†—III.

On his return from Paris to Germany Wagner had a double task before him. He was eager to have "Tristan and Iseult" performed in one of the opera houses, and no less eager to obtain money. There were always obstacles to the mounting of the opera, and for a time Wagner was compelled to give up negotiations with managers. He, therefore, undertook a series of concerts, and he appears to have found for the first time a financial success when his troupe reached Russia. On his return he settled in Vienna, and there he squandered nearly all the money he brought back. Hereafter people will not think worse of Wagner because he resembled Oliver Goldsmith in his manner of arraying himself in sumptuous apparel, for such conduct suggests that the philosophical musician was only a mortal like the majority of his fellow-sinners. Thieves broke into his house, and were able to carry off many valuables, but, as they spared all manuscripts, it was supposed they did not belong to the composer's band of worshippers.

Worse to bear was the neglect of "Tristan and Iseult." Managers and audiences were indifferent to this pessimistic work. Dresden was willing to take Wagner back, and even agreed to most of the exorbitant conditions which he stipulated. The Government was ready to pay him a large and life-long salary, to permit him to reside in the grand ducal palace, to give him a box in the theatre, to place the

† *Richard Wagner: Sa Vie et ses Œuvres.* Par Adolphe Jullien. Ouvrage orné de Quatorze Lithographies originales, par M. Fantin-Latour; de Quinze Portraits de Richard Wagner; de Quatre Eaux-Fortes, et de 120 gravures; Scènes d'Opéras, Caricatures, Scènes d'intérieur, Vues de Théâtres, Pièces autographes, Costumes d'acteurs, &c., &c. Paris: J. Rouam. London: Gilbert Wood & Co.

grand ducal carriages at his disposal; but as soon as he proposed the adding of "Tristan and Iseult" to the *répertoire* the business came to an end. With all its enthusiasm for him Dresden could not stand that work. WAGNER was disgusted with a world that would not take its gospel from him, and he resolved to retire from it (and his creditors) to some retreat in Switzerland. Just at this time, however, the King of BAVARIA died, and as his successor, the unfortunate LOUIS II., believed it was his mission to propagate the new music, WAGNER might feel as elated as Sir JOHN FALSTAFF when, in SHALLOW'S orchard, he heard that his tender lambkin was king, and convinced himself that the laws were at his commandment.

The first act of the young King was to send a secretary with an invitation to WAGNER begging him to come to Munich, in order that he might finish his work. "I thought," said WAGNER when he received the letter, "that I was lost. Now I am saved. All my hopes are surpassed, for the King puts everything of which he can dispose at my disposition." WAGNER set about introducing many reforms in all that related to music in Munich, and it is needless to say he found many opponents. One of his first thoughts was to bring SEMPER to the city, in order that a theatre might be constructed on a scale that befitted the series of operas relating to the "Nibelungen."

In spite of the royal patronage the operas of WAGNER were hardly more acceptable to the amateurs of Munich than to those of Paris. There were some who were able to admire them, and others who affected to do so; still the majority continued to be loyal to the older methods. Munich is one of the few places in Germany in which something resembling public opinion has managed to thrive, and it was unfavourable to the composer. There were grounds for allegations against WAGNER. He brought strangers to the city to have them placed in high offices; he was the cause of a large expenditure of money which must be paid by the people, and, worse than all, he was supposed to interfere with political matters. WAGNER was not an ORPHEUS, with power to overcome men by the concord of sweet sounds. As soon as it was known that SEMPER had received orders to construct a new theatre, the agitation reached a height that compelled the King to sacrifice his favourite. WAGNER was once more turned adrift; but this time at least he was possessed of a viaticum in the form of a yearly allowance. He went first to Switzerland. Afterwards he was followed by his lieutenants, for Munich made no restriction in its clearance. However, when the "Master-singers of Nuremberg" was to be brought out WAGNER went back to the city, in order to control the arrangements. He took care to keep within his legitimate province while there, and the musical comedy was successful.

Swiss air had a curious effect in exciting WAGNER to become a publicist. We have already recorded how he tried to get up a crusade against Hebraism in music. This time the cry was against France. He professed to be as much afraid of the power of the "seductions of Paris" as of "the self-sufficiency of England" over the minds of his countrymen, so he appealed to the German rulers, and especially to the King of PRUSSIA, to lay the foundation of a new German civilisation, which might extend to the frontiers of the Fatherland. The meaning of it, according to M. JULLIEN, was "enable me to represent the 'Nibelungen.'"

The young King of BAVARIA did not need a pamphlet to incite him to a duty of that kind. His Majesty had ordered that a fragment of the trilogy was to be performed for his birthday in 1869, but owing to the difficulty of having all the machinery in working order, the "Rheingold" was put off for a few weeks later. The King's Wagnerism was a serious drag on the exchequer, for the birthday treat needed an orchestra of at least 120 instrumentalists, and the machinery alone cost 5,000*l.*

In spite of all the money that was expended the Munich opera house was insufficient for the proper display of the sections of the "Nibelungen." SEMPER had designed a theatre that was worthy of such an entertainment, but there was a limit to the King's purse in Bavaria, and so vast a building was therefore impracticable. As the school for singing which the King and WAGNER had established was only allowed to exist during two months, to propose the erection of a colossal theatre would be to run the risk of a revolution. WAGNER, therefore, resolved to appeal to the newly-united Germany. The French war, he said, had enriched the Government almost to superfluity, and how could a share of the money be better appropriated than in advancing national, that is, Wagnerian art? He tried to ingratiate himself by composing a coronation march for the Emperor, but the estimation in which WAGNER held himself as a sovereign in his way was different to that of the Imperial court's. WAGNER'S day-dream about the French spoil that was to come to him was rudely dispelled when he found he was treated as if he were only a regimental bandmaster, for all he received was a sum of 300 thalers, or say 45*l.* It is no wonder that he was indignant on discovering that there was to be little difference between the old and the new Germany. He therefore turned from kings to the people, and appealed to them and his admirers throughout the world for aid to enable him to erect a theatre, for which Bayreuth was selected as a site. Everybody is aware of the peculiar character of the building, which no theatrical manager would venture to imitate. The exterior was almost as plain as an Elizabethan theatre. The interior is restricted in division to a pit and two rows of boxes; moreover, the pit becomes narrower as it approaches the stage, the space at the sides being arranged as a series of projecting wings in order that it can never be utilised by spectators. The orchestra is placed below the level of the stage and is concealed from the house. But the building has many advantages, everybody can hear and see well, there is no colossal gaselier, figure-painting or decoration to attract attention or disturb repose. In its severity the Bayreuth theatre is more allied to Athens than to Paris. The audience is also supposed to attend for the purpose of hearing music instead of for the display of the latest fashion in robes. To realise what the characteristic Wagnerian opera is like one must make the journey to Bayreuth. It is only there that full justice can be rendered to the composer's and dramatist's idea.

The subjects of the operas were Germanic, and as far as possible the scenery and dresses were no less suggestive of the country. The museums were ransacked for materials that would suggest what ornaments were in vogue in prehistoric ages, and the scenery was derived from places where nature remains uncultivated. The elements of the spectacle were not superior to what is to be seen in Paris and London. The machinery that was employed to suggest the floating motion of the three Rhine nymphs, which was one of the most effective "hits," may be supposed to be more ingenious than what is to be seen in Drury Lane or in one of the great provincial theatres at Christmas time, but it deserves to be remembered that in the latter all that is needed is the display of mute supernumeraries for a few minutes, while the nymphs are important characters. As good scenery is to be seen in Paris and London, and a better display of colour in costumes will be found in London (for every impartial playgoer must testify that very crude dresses are to be seen in Paris especially when a crowd is placed on a stage), but, as we have said, the *ensemble* in Bayreuth has an individuality about it that we seek in vain elsewhere. In spite of much crudeness of colour, and the modernness of the materials in the dresses, there is a mythic character about the performers and their environment which brings the spectator into a true relation with the legends and with the strange music.

When the first performances were over, and the representatives, who came from places so far apart, were satisfied, surely a little elation was allowable to WAGNER, who was then able to see the realisation of what he had dreamt in poverty and exile. In the words which he spoke to the auditory he was not happy, for he appeared simply as an egotist, but afterwards he did more justice to himself. There was a touch of old-fashioned simplicity in the spectacle of WAGNER marching round the dinner-tables (the charge was five shillings a head) with a crown of silver leaves on his head, which he raised at times in order to salute the spectators.

But the usual fate attended the performances. In spite of all the enthusiasm there was a deficit of over 5,000*l.* WAGNER came to London to try and make up the deficiency. He could not be more warmly received in any part of

Germany, but again there was a loss of 5,000*l.* The reason is that it is difficult to do justice to WAGNER'S compositions without a large array of performers, and from the character of the music they must all be men who are skilled, and who can command good pay. It should accordingly be remembered, whenever his foibles are recounted, that WAGNER, in seeking to realise his ideas, was not inspired by the hope of making money. If he had been, his compositions would have borne a different character, and be more adapted for popularity.

While he was in London WAGNER was able to reveal to his friends the poem of "Parsifal," on which his next opera was to be founded. We are told by M. JULLIEN that the composer was for some time displaying a penchant towards mysticism and the miracles of Christianity, and of this new mood "Parsifal" was the expression. He was about four years employed on the music. "Parsifal" was heard with satisfaction in 1882, and, unlike the majority of the composer's works, there was a profit of about 4,000*l.* derived from the first representation.

WAGNER had predicted that "Parsifal" was to be his last work, and he was right. He was greatly fatigued by the rehearsals, and on the advice of his doctors he left Bayreuth soon after the performances, and took up his residence in the Vendramini Palace, Venice. There he seems to have suffered from melancholy, as if he knew the end was approaching. On February 13, 1883, as he was about to take a turn in a gondola, his anger was excited and he fell into a chair, saying, "I feel very ill." Afterwards he fainted. He was carried to bed, and a doctor was sent for, but when he arrived WAGNER was dead. His last words seemed to relate to his son, for whom he was unable to make provision.

It may be conceded that WAGNER followed a logical principle in the construction of his operas. In this way he corresponded with SEMPER ; but the two men, in common with all theorists, forgot that other principles than their own may be logical also. The old-fashioned notion of an opera was that it should appeal to our emotions rather than to our intellect. It was, as VOLTAIRE said, a spectacle—

> Où les beaux vers, la danse, la musique,
> L'art de tromper les yeux par les couleurs,
> L'art plus heureux de séduire les cœurs,
> De cent plaisirs font un plaisir unique.

Everything may be false, but it would be difficult to discover any form of entertainment on a stage—and we do not forget WAGNER'S compositions—which can be said to be true to nature.

The primary intention of an opera was to give an opportunity to combine several lyrics, and in this way to overcome the disadvantage of a concert. The early Italian operas were as simple as any of the English musical dramas of the "Midas" species. It was, no doubt, incongruous to have a speaker suddenly break into song, as in the "Beggars' Opera," "Rob Roy," or "Guy Mannering," which somehow still afford pleasure to an audience. Hence the next step in the evolution of the opera was the giving of a musical form to the parts between the songs, but it was of such a character that the simplest critic could detect where the parts joined, and the lyric still remained supreme. Often, as with the Italians, it might seem to be in excess. WAGNER'S aim was to have more unity in his work. He was not by nature a lyrist, for that form of music and poetry supposes a power that if intense is intermittent. Now WAGNER could always compose, and in such machine-like power he was not a bad representative of the age. He set aside established conventionalisms, and the extent of his revolutionary ideas is suggested when we find that he could keep a prima donna on the stage during an act without affording her an opportunity to utter a note. But, as usually happens in cases of reform in art, he substituted conventionalisms of another sort. If tested by a standard of realism, the finest Wagnerian opera is as absurd as anything by APOSTOLO ZENO or METASTASIO, and the seriousness of his intention makes matters worse. Although they may be indifferent to a melody, WOTAN and BRÜNNHILDE are as remote from every-day life as the TITUS or ANDROMACHE of an old Italian opera. We do not quarrel with WAGNER for creating a new species of opera. Art is not to be restricted within narrow bounds or to be cast in one mould, and it is no more possible to have a best style in dramatic music than in architecture.

WAGNER could not give vent to the genius which he possessed if we were bound down to poetry of this kind :—

> Si cerca, si dice
> L'amico dov' è ?
> L'amico infelice
> Risponde, Morì ;

he needed a more ample sort of metre. Indeed, WAGNER seems to us to have been one of the men who are impressed by magnitude in space, and his music is an attempt to express his ideas of the vast. In this respect he was a counterpart of DE QUINCEY, and, if ever there was a composer who was competent to express the immortal "Dream Fugue" in music, it was RICHARD WAGNER. He would have no difficulty in realising all that was meant by the Opium-Eater's wanderings "in the worlds of sleep, through storms, through desert seas, through the darkness of quicksands, through fugues and the persecution of fugues, through dreams and the dreadful resurrections that are in dreams."

It is time we spoke of M. JULLIEN'S book. His biography is as much of an innovation in the literature of music as WAGNER'S works were in music. No composer heretofore has had such a book devoted to him. As we said at first, it represents not only what was done by WAGNER, but what contemporaries thought of his work. It is for that reason that so much is made of caricatures which express at a glance the opinions that were common in Germany, France, and England about the music of the future and its creator. If, however, French artists occasionally made WAGNER wince when they made fun of his pretensions, his spirit can find compensation in the exquisite lithographs which M. FANTIN LATOUR has consecrated to the operas.

They form ideal representations of some of the characters, and they suggest how much tenderness and beauty an artist can discover in things that are supposed to have opposite qualities. A German would put a very indifferent interpretation on the characters, and would give more massiveness to the figures. M. FANTIN LATOUR has not, however, gone to the stage for models, but seeks rather to give the spirit of the creations. His plates are the tribute of one poet to another, and are enough to convert opponents into enthusiasts.

It would be vain to deny that at the present time the prejudice against WAGNER still prevails in France. The proprietors of the Librairie de l'Art have again proved their courage in undertaking so costly a work about the composer. But the bitterest enemy of WAGNER'S music would find interest in the book ; for whatever may be thought of the operas, WAGNER was one of the disturbing forces in our age, and in accomplishing his aims he proved that he had a hero's strength. The lives of men of his class will always be a fascination to humanity.

THE ROYAL INSTITUTE OF ARCHITECTS (IRELAND).

ON Monday a deputation from the Royal Institute of Architects (Ireland) presented an address to the Lord Lieutenant of Ireland at Dublin Castle.

The deputation consisted of Messrs. J. H. Pentland, W. Sterling, Rev. J. R. Carvell, W. Cox, Charles Geoghegan, W. J. Symes, Sir Charles Cameron, W. Gillespie, Cecil Orr, Thomas Drew, R.H.A., C. A. Owen, Albert E. Murray, hon. sec.

Mr. Drew, in the absence of the president, Mr. W. H. Lynn, read the following address :—

May it please Your Excellency,—We, the President, Fellows, and members of the Royal Institute of Architects of Ireland, desire to offer your Excellency our respectful congratulations on your arrival in this country as the representative of Her Majesty the Queen. Representing as we do one of the arts which ministers to the requirements of all classes of society, whether from an æsthetic or an utilitarian point of view, we believe that we can claim your Excellency's sympathy in our work. The character of the architecture of any nation has always been considered to be a fair standard of the degree of civilisation and refinement to which it has attained. Judged by this test, we believe that the architecture of our country is not unworthy of the genius of the Irish people. We

hope that with the return of prosperity to our country increased opportunities may be afforded to us for further advancement, as our art can only flourish concurrent with social and commercial progress. We wish to direct your Excellency's attention to the marked improvement which has been made of late years in the dwellings of our artisans and labouring classes. Although much remains to be done in this direction, yet we are confident that the progress that has been already made will continue, and that the moral as well as the physical well-being of the people must necessarily be promoted thereby. We desire to conclude with renewed assurance of our loyalty to Her Most Gracious Majesty the Queen, who is the patron of our Institute, and with the request that your Excellency will, as your predecessors in office have done for nearly half a century, be pleased to accept the position of vice-patron of the Royal Institute of Architects of Ireland.

W. H. LYNN, president, R.I.A.I.
ALBERT E. MURRAY, hon. sec.

His Excellency in reply said :—

Mr. President and Gentlemen,—I thank you most heartily for your personal congratulations to myself, and for the assurances of your undoubted loyalty to our gracious Sovereign, whom it is my high privilege to represent. I am fully sensible that the community are under many and deep obligations to your profession, and I assure you that your labours for the public good will always command my sympathy and regard. It affords me much pleasure to offer you my sincere congratulations on the general advance which architecture in Ireland has made within comparatively recent years. Since my arrival here I have been much struck by the numerous new and handsome buildings that adorn the metropolis, as well as by the many graceful villas that have sprung up around our city. The splendid churches and schools and other public institutions that have been erected throughout the country amply attest the skill of our architects and the excellence of their work. I have noticed also with pleasure the much-needed improvement that has taken place in the dwellings of our artisan and labouring classes, and I feel sure that the local boards and private individuals who take such an interest in this important question have derived much assistance from the advice you have afforded them. I am very glad to observe a growing tendency to utilise to a greater extent than in the past our excellent Irish marbles and slates and other native products, and I am confident that none will strive more earnestly to foster this movement, which must have an important influence on the extension of our Irish industries, than the architects of our country. It will give me much pleasure to accede to your request to become vice-patron of your society.

TESSERÆ.

Somerset House.

S. HUGGINS.

SIR WILLIAM CHAMBERS designed Somerset House, the great courtyard and external façades of which are perhaps unrivalled even in Italy. Among the English edifices it is for nothing more remarkable than for its completeness—completeness not only in architectural embellishments, but in appropriate sculptural accessories, executed by eminent artists, and of a high class of art. Its spectator feels no want; all is perfect and satisfactory around him, and he enjoys the pleasure arising from the presence and influence of unity and harmony of proportion and form, just relation and balance of parts, and a due measure and distribution of decoration. The river front, seen from the water in conjunction with the massive open arcade of rustic work supporting its terraces, has a degree of grandeur possessed by no other façade in London except the west front of St. Paul's. Mr. Fergusson, who has in his "Handbook of Modern Architecture" spoken somewhat disparagingly of the works and abilities of Chambers, thinks this façade too low—and certainly additional height would have increased its majesty of character; but it would, at the same time, by entailing additional height elsewhere, have rendered the rest higher than sufficient, and probably have had the effect of diminishing the apparent magnitude of the great court. Somerset House shows how eminently suitable is the Venetian-Italian style for a building of public offices—a building requiring architectural greatness of character externally, but minutely divided within into several floors and many apartments.

Early Norman Castles in England.

C. T. CLARK.

The original policy of the Conqueror was, as far as possible, to establish his rule quietly, and to come in as the heir to the throne. With this view, when the opposition of the English chiefs led him to root them out, he usually placed the Norman successor on the English seat. Thus nearly all these burghs or mounds having been the seat or *aula* of a Saxon lord, the change to the common people was not necessarily violent, though it often became so. The tenants dwelt round and paid duty and service at the accustomed spot; no alteration was made in the parochial unit, sokes and hundreds and other territorial divisions remained, with their courts, unchanged; and though land ceased to be allodial, and military service was sharply exacted, it may be supposed that Godwin and Harold and the great English lords had not scrupled to make their tenants follow them in the war, not as mercenaries, but more or less at their, the tenants, own charge. Hence, although the Conqueror occasionally ordered a castle, like the Tower, to be built on an entirely new place, more commonly, and especially with the mesne lords, the castle was nothing more than the old English residence, with its defences replaced by walls and towers, no doubt of formidable height and strength. The Norman made ample use of timber for military purposes, but it was rather for barriers and outworks and the light defences, than for the main walls of his stronghold, or for its towers or keep. Inside these, however, it was also largely used. The early floors were almost invariably, like the roofs, of wood, and the dwellings of the dependents long continued to be mere huts of timber, sheds built against the walls, always getting out of order, and a continual source of expense to the lord, or, as we see in the records of the royal castles, to the sheriff of the county. Where the site was new, as in London or at Newcastle, or where there was no mound, as at Corfe or Ludlow, Bristol, Carlisle, or Brougham, or Ogmore or Penlline, a rectangular keep was, as a matter of course, constructed; but where there was a mound, as at Arundel, Trematon, Warwick, York, Cardiff, Caerleon, Worcester, Builth or Ewias-Harold, Kilpeck or Lincoln, the keep became a circular or polygonal shell, or in some later cases, as Warwick and York, a tower of a quatrefoil pattern, thus preserving, but elevating, the older English type. The rectangular form of keep, being more durable and more striking to the view than the shell keep, has become the received representative of a Norman castle; but it is probable that at the least one-half of the castles erected between 1066 and 1200 were of the other type. The mounds which, for a century or two after their erection, would not have carried in safety any heavy masonry, became firmly consolidated, and, as the form of structure placed upon them was judiciously designed, any serious settlement is rare. There are but two instances at present known in which the mound and the rectangular keep are found in the same group, and in these two cases they are actually combined. They are Christchurch, where the mound is small, and the keep is probably founded, through it, upon the solid; and Guildford, where the mound is large, but the keep is built upon its edge or slope, and there also rests upon the virgin soil. At Oxford the remaining square tower, though Norman, was on the wall, and was not the keep. This was a shell, and crowned the large mound, which still contains a part of its subterranean works.

The Theory of the Arch.

JOSEPH GWILT.

It was comparatively late that the theory of arches attracted the notice of mathematicians. Dr. Hooke gave the hint that the figure of a perfectly flexible cord or chain, suspended from two points, was the proper form for an arch. Galileo considered the catenary as a parabolic curve, and John Bernouilli appears to have been the first who discovered its nature. Dr. Gregory ("Phil. Trans." 1697) published an investigation of its properties, and observes that the inverted catenary is the best form for an arch on account of its lightness. This is true so long as it is not pressed by an extraneous weight. It is not, however, capable of bearing a load on any part, much less of being filled up on the spandrels, which must be the case in practice. Other considerations must be involved before it can be fitted to receive a roadway or other weight, either upon its crown or haunches. In 1695 La Hire, in his "Traité de Mécanique," established by the theory of the wedge a method of determining the proportion in which the lengths of the voussoirs should increase as they approximate the springing. The historian of the Academy at Paris intimates, in 1704, that Parent, following the same theory, but without proceeding further than mechanical delineation, gave the extrados of a semicircular arch, together with its horizontal drift. Couplet wrote two memoirs in the volumes of the French Academy for the years 1729 and 1730. He trod in the steps of La Hire and Parent, and made but little advance in the scientific investigation of the subject. He treats chiefly on the drift or shoot of semicircular arches and the thickness of the piers, considering the arch-stones as infinitely smooth, and experiencing no resistance from friction. In the volume of the Transactions of the French Academy for 1734 is a memoir by Bouguer, "Sur les Lignes Courbes propres à former les Voûtes en Dôme." In this is an analogy between cylindrical and dome vaulting, the one being supposed to be formed by the movement of a catenarean curve parallel to itself, and the other by the revolution of the same curve about its axis. The wedge theory has since been followed by Belidor and others on the Continent, and the late ingenious Mr. Attwood

in this country. Such was the state of the progress towards a perfect development of the true theory of arches when our countryman, Mr. Emerson, in 1743, investigated the nature of a proper extrados of the different curves. Casting a new light upon this curious and useful subject, he exposed the fallacy of La Hire's wedge theory, and it is now completely exploded. Dr. Hutton, in his "Principles of Bridges" and in the first volume of his tracts, pursued the subject on the principles laid down by Emerson. He added the method of finding an intrados to a given extrados, which indeed seems the principal addition he made to this branch of science. Bossut, on the Continent, republished with additions, in his "Cours de Mathématique," a tract on the subject; and in 1785 Mascheroni published at Bergamo a work entitled "Nuove Ricerche sull' Equilibrio delle Volte," in which there are some propositions upon the equilibrium of arches, but it principally relates to domes on circular, elliptical, and polygonal plans.

Expression of Stability.

E. M. Barry, R.A.

With repose in architecture is associated stability. We must be satisfied of the one before we can appreciate the other. To obtain stability in an artistic sense a reserve of power is needed. It is not enough for us that a building stands. Our judgment must be satisfied that it ought to stand and that it will go on standing. We must obtain on this head perfect satisfaction. It is the want of this confidence which troubles us with so much of the iron constructions of the day. We see great spans covered or bridged. We look up at the roofs and are glad to get from under them. Will they last? The engineer will tell us the tensile strain on an iron plate, and the number of inches of sectional area necessary by calculation, and assures us that the stress upon his roof is well within the calculated strength. It may be so; our judgment may be convinced, but not in an artistic sense. The thing is bald and uninteresting; and we think of works of architectural art, as to which no such questions intruded themselves, because the requirements of true architecture were effectually supplied. The Mediæval architects were not always proof against the temptation of seeking to construct mere *tours de force*. Of such you may find an example in the Cathedral of Beauvais. Here the ambition of the architects to surpass what had previously been done, led them to mistake bigness and daring construction for art. The spire has fallen, the roof gave way soon after its erection, and the nave arches have had to be strengthened by the insertion of intermediate columns, bisecting the original arches. Want of repose and stability are fatal to the artistic effect of the design, which deserves study, however, as an exaggeration and a warning. I once heard a prominent civil engineer say that every railway station ought to be pulled down and rebuilt every ten years. The growth of traffic and of modern wants is rapid, and such structures are too often built for utility alone. Architecture, however, will not be satisfied with so brief an existence. It must aim at so much of permanence as it is permitted to mortals to attain; it must hand down the present to future ages, even as the past speaks ever to ourselves.

Induration of Stone.

C. H. Smith.

It is a characteristic feature in quarries of oolite that the stone procured from the uppermost beds is generally, perhaps invariably, of a durable quality, whereas the lowest beds are the first to decay, when exposed to weather. The cause of this difference is known to depend chiefly on the quantity and quality of the cementing substance, by which the particles adhere to each other. The cement that unites the globules into a mass is formed of the same elements as the globules themselves, but more crystalline; it is, in fact, the decomposition of the superincumbent mass, saturating and crystallising within the beds beneath. But this natural process of indurating is not performed in a day, nor in a year, but in ages; so slow or gradual is the process, that in scarcely any case is the lowest bed so hard, or so thoroughly saturated with the crystalline material as those above. It seems to me that if we could pursue or imitate this natural process, it might lead to the best means of improving the natural condition of soft stone, or, in other words, we might finish the stone which is imperfectly formed in the rocks, Nature not having had time to complete her work. Man can command Nature in no other way than by obeying her laws; in all our experiments or performances it is not we who operate, but the laws of Nature which are set in operation. The durability of compact carbonate of lime, in a crystalline state, either in the form of stalactites, or that of a porous material, rendered dense and durable by impregnation, may be witnessed in numerous instances in this country, especially in the petrifying caverns of Derbyshire. In the South of Italy and in Sicily the production of excellent building stone, entirely formed by deposition from water, has been going on abundantly from the earliest ages of the world to the present time. The temples of Pæstum, constructed more than two thousand years ago, with aqueous deposit from the neighbouring rivers, are still but little decomposed, so far as the stone is concerned. Most of the modern buildings in Rome, including St. Peter's, which are constructed with a similar material, travertine stone, or calcareous tufa, are generally in excellent condition. In the waters which produce these petrifications there must be some solid body as a nucleus to begin upon, but what constitutes it is in no respect important; any substance will do for the waters to commence their petrifying works upon. Hence, at the caverns, "the wonder seeker" is invited by the guides to purchase birds'-nests, purses, and various other articles, said to be changed into stone, whereas, in fact, the objects themselves are merely encrusted with stony matter. Although this natural process is progressing now, and has been during all ages, and, to a certain extent, is well understood by chemists and others, yet it has not been applied to any important purposes, and certainly never to artificially indurating and preserving soft stone. If we could successfully imitate Nature in this respect, and apply our efforts to the purpose now under consideration, I think they would be more likely to answer than any plan heretofore attempted. It is not in my power to tell you how to proceed, but the principle appears so clear and simple, that I am induced to believe the proper mode of application would soon be found if scientific men would turn their attention in that direction.

Permanent Set of Cast Iron.

Edwin Clark.

Since the extension of cast iron is not uniform in proportion to the weight, we cannot deduce a modulus of elasticity calculated on the assumption of equal extension for equal weight. It appears that cast iron is extended about $\frac{1}{4262}$ of its length by one ton of tensile strain per square inch of section, and about $\frac{5{\cdot}6}{4262}$ of its length of six tons. We shall, therefore, for practical purposes, assume the extension at $\frac{1}{5000}$ per ton per square inch, or double that of wrought iron, as this proportion is easily remembered and very convenient for application. The following formula will be found also very correct and convenient for deducting the permanent set from the extension of cast iron, viz.:—

$$\text{Permanent set} = {\cdot}0193l + 64\,\frac{2}{l}$$

l being taken in inches.

The mean ultimate strength of cast iron we shall find is seven tons nearly per square inch of section, its ultimate extension being $\frac{1}{600}$th of its length, and this weight would compress a bar through $\frac{1}{775}$th of its length. With respect to the ultimate tensile strength of cast iron, very different conclusions have been arrived at by various experimenters, who have drawn most erroneous conclusions from the fracture of cast-iron beams. It is certain that the strength of this material is considerably dependent on the amount of surface. When cast in thick bars, the external portions become rapidly cool, form a solid shell around the internal part, which is thus prevented from contraction, and cools in a state of tension. The effect of this is to crystallise the internal portion of the metal, the crystals being larger in proportion to their distance from the surface, while the outside skin, as it is termed, is close and extremely hard and considerably stronger than the interior, either as regards extension or compression. Experiments have accordingly been made with metal cut out of the interior of large castings, and the falling-off in their strength has been found very considerable. Hence, results drawn from small bars or beams cannot be depended on when applied to larger castings.

Unity of Periods of Art.

Violllet-le-Duc.

When a community of artists and artisans is strongly imbued with the logical principles that require all form to be a consequence of the destination of objects, style manifests itself in every work which comes from their hands, from the commonest urn to the greatest monument, from the kitchen utensil to the richest piece of furniture. We admire this unity in the good periods of Greek art; we find it again in the best epochs of the Middle Ages, though with another character, because the two forms of civilisation were so different. We cannot assimilate the style of the Greeks, because we are not Athenians. We cannot master the style of our ancestors of the Middle Ages, because times have changed; we can do no more than affect the Grecian manner or that of the thirteenth century. In a word, we can but make pasticcios. But, if we cannot create the same things as they created, we can at least proceed as they proceeded, that is to say, we can imbue ourselves with true and natural principles like theirs, and then our works will possess style without any striving for it on our part.

NOTES AND COMMENTS.

SOME weeks ago we gave a short account of the class of masonry at the City and Guilds of London Institute. Since then the members of the first class have met twice. The classroom now resembles a practical mason's yard, in which each workman had his allotted number of stones to cut. An account of the work done by each member is kept in a book, besides which, each stone is signed on the face by the member who cut it, so as to be clearly recognisable when set up in the wall. The members of the class seem to be much interested in their work, although they found it harder than they anticipated. We may remind those who have not yet joined that the second class, which will begin on December 14, will enjoy the advantage of being assisted by a staff of foremen taken from the members of the first class, and this arrangement will much facilitate the future operations.

THE Professorships of Construction and Perspective, in the Ecole des Beaux-Arts, Paris, are vacant. The former was held by M. BRUNE and the latter by M. CHEVILLARD, with the aid of M. JULLIEN. It is a rare event to find two professorships vacant at the same time. The appointments will be made by M. GOBLET, the Minister of Fine Arts.

ACCORDING to an article by M. DE VEYRAN in the last number of *L'Art*, an inhabitant of the town of Grasse possesses four characteristic works by FRAGONARD, which were obtained under remarkable circumstances. They were painted for Madame DU BARRY, who had ordered them for her château of Luciennes. But when LOUIS XV. followed the common lot, Madame DU BARRY had to fly, and finally found her way to the guillotine. Her ladyship could have had no more suitable painter, nor FRAGONARD a more suitable patroness. The pictures, were rolled up and remained in his studio until the Revolution broke out. The painter saved his head by taking a seat in the Convention. That was a risky honour, and in a short time FRAGONARD was compelled to flee to his birthplace, Grasse, and to seek refuge with a friend, a M. MALVILAN. The painter offered his friend the Luciennes pictures at a low price, and in this way they came to Grasse. After the Reign of Terror FRAGONARD was safe. He visited Grasse occasionally, and painted *amorini* to fill up the spaces between his pictures on the walls. He also suggested the kind of furniture that was best adapted to go with the paintings, and even designed the carpet. The room might have been arranged for a king's favourite. The pictures form a love-story—in the FRAGONARD-ish sense. They consist of *The Meeting*, *The Rendezvous*, *The Coronal*, *The Letters*, and a fifth, which was afterwards commenced but remains unfinished, is *The Abandonment*. The room is as the painter arranged it, for the grandson of FRAGONARD's friend is too respectful to the history to allow an alteration.

PROFESSOR HAYTER LEWIS, in his article on architecture in "The Companion to the Almanac," is always able to take a view of the architecture of the year, and to note its tendency. This time he says the progress is towards a Transitional style of Gothic forms, with Renaissance details. Judging from the exhibition of the Academy, the Professor considers that for houses in town such a Transitional style is in favour, while Gothic of a Perpendicular kind serves for the remainder. But in ecclesiastical buildings, Early English continues to hold its own, and it is only in municipal and public buildings that Renaissance is found. While recognising the picturesqueness of the new Transitional style, Professor HAYTER LEWIS says that although details may be quaint, there is no necessity to have them coarse and ugly.

THE regulations of the Salon which are issued yearly are watched with as much interest as the Standing Orders of the Houses of Parliament by engineers and surveyors. It is impossible to understand why alterations should be made in the English or French enactments, but an oversight might have serious results in both cases. There is little difference between this and next year's Salon regulations for architecture, and the reason of that little is not apparent. It used to be said that copies of designs were not acceptable; next year there will be no restriction of the kind, although we can hardly believe that copies are admissible. Photographs may again be sent—an arrangement that should be considered by the Council of the Royal Academy, but what is the use of manuscript or printed monographs? Was it ever known that a visitor read one of those productions? There is nothing about "mentions honorables" for next year, and the Médaille d'honneur will not be awarded on less than two series of votings. This year drawings could be sent in between April 2 and 5, next year the time is April 3 to 5.

MR. C. H. SHOPPEE suggests that the removal of Staples Inn should be taken as an opportunity to construct a new street, which would serve as a continuation of Gray's Inn Road and form a junction with Chancery Lane. The new street would be 55 feet in width, in almost a direct line from Holborn Bars to Bream's Buildings, and thence by an easy curve into Chancery Lane, opposite Carey Street, the width of Chancery Lane at its lowest end, viz., from Carey Street to Fleet Street, being increased to 55 feet by pulling down the old houses belonging to the Rolls Office. If this improvement were made, a first-class direct route would be formed between the Law Courts and the railway termini at King's Cross, and the new street would prove an important link in the contemplated improved communication between Gray's Inn Road and Islington. There is no doubt that an improvement of the kind has become a necessity. Chancery Lane is too narrow for the traffic between the northern and south-western parts of the metropolis. If the street were made, it might reconcile some of the opponents of the removal of Staples Inn to what is inevitable. The line of street might be so laid out as to save the old hall, which is the only part of the Inn having any value.

THE town of Port-Andemar is not much of a place, and few would expect to find a museum there. By the efforts of the local architect, M. LECLERCQ, a room was assigned for the purpose, but all the treasures that were available were a few prints and casts contributed by the State, and a couple of pictures. M. PAUL LEROI has, however, come to the rescue of the little town. He has sent several valuable etchings, drawings, and medallions, and in this way a collection has been set up which the inhabitants can visit without undergoing a sacrifice. The town is able to contribute no more than 20*l.* to the undertaking. If somebody in England could be persuaded to imitate M. PAUL LEROI's example, all the manufacturing towns would soon have their local museums.

THE British Institution, which was founded in 1805, was one of the best of English societies. According to the by-laws, the object of it was "to encourage and reward the talents of the artists of the United Kingdom, so as to improve and extend our manufactures by that degree of taste and elegance of design which are to be exclusively derived from the cultivation of the Fine Arts, and thereby to increase the general prosperity and resources of the empire." The Institution was, in fact, the complement of the Society of Dilettanti. The exhibitions were originally confined to pictures by "artists of or residents in the United Kingdom," and the earliest were of the works of REYNOLDS, HOGARTH, WILSON, GAINSBOROUGH and OPIE. The subscribers paid at least fifty guineas. Although the Institution was liberal in premiums, and purchased several works for presentation to the National Gallery, yet, so well were affairs managed, there was a large balance remaining in the hands of the trustees, and now it is said to amount to 30,000*l.* What is to be done with it? The Charity Commissioners, it appears, have laid claim to the money, but there are enough benevolent people in England without appropriating funds that were raised for the promotion of art. It might be said that the money could be given in support of the proposed National Exhibition of the works of artists who are discontented with the Academy. But that purpose would be contrary to the intentions of the donors, for the British Institution was intended to extend and increase the beneficial effects of the Royal Academy—it gave preference to pictures that were once hung in the Academy, and the galleries were closed on principle during the Academy exhibitions.

ILLUSTRATIONS.

DECORATIVE PANEL.

A SERIES of illustrations that is representative of the styles of the leading decorative painters in France would be incomplete without an example by M. Tony Faivre. He paints figure pieces on large and small scales, but his countrymen consider him to be unsurpassed now with subjects of the class which is shown this week. It is a style which at one time was largely patronised, and it still is found to be very suitable. There is no reason why decoration should be confined to figure subjects, and M. Tony Faivre demonstrates every year that charming combinations of landscape and architecture are still to be utilised. The painting we have reproduced has a companion, which, of course, is differently treated.

ARCHITECTURAL ILLUSTRATION SOCIETY.

No. 39.—DOORWAY, ST. GIOVANNI, LUCCA.

BASEMENT SMOKE-ROOM IN THE VICTORIA HOTEL, MANCHESTER.

IN *The Architect* has appeared from time to time illustrations of various portions of the Victoria Hotel, Manchester, and of the important block known as the Victoria Buildings, of which the hotel forms a part. The subject of our present illustration is the basement smoke-room. This room, which is near the grill-room and adjoining the billiard-room, is situated below the street line, and depends therefore for its light on two large areas faced with white glazed bricks. The windows looking into these areas are glazed with ornamental leaded lights somewhat similar in character to those shown in the borrowed lights and doors opening into the main corridor. The walls above the dado are covered with ornamental tiling, and the dado itself is composed of walnut wood framing, panelled and filled in with tiles rich in design and colour. The floor is laid with Italian mosaic, warm in tone, and the ceiling, which is panelled, is formed of fibrous plaster richly decorated. The chimneypiece is a combination of walnut wood, marble, tiling, and Lincrusta Walton, as indicated in the sketch. The pilasters are panelled and filled in with Burmantoft faïence of beautiful design. This smoke-room, as will be gathered from the illustration, is elaborately decorated, original in treatment, and strong in tone, but throughout a harmony in colour. In the Victoria Hotel there is an endless variety of design and decorative treatment, each room being different from the others, and there is probably no hotel out of London so splendidly finished.

The hotel and buildings have been erected at a cost of 230,000*l.* Mr. William Dawes, of No. 2 Cooper Street, Manchester, was the architect.

THE OFFICE OF SUPERINTENDING ARCHITECT.

AT the meeting of the Metropolitan Board of Works on the 19th inst., the deputy-chairman, Mr. Edwards, brought up a report from the Works and General Purposes Committee recommending that the following resolutions of the Board of July 2, 1886, be revoked :—"That the salary of the superintending architect be 1,500*l.* a year, inclusive of travelling and incidental expenses." "That the age of the person to be appointed to the office of superintending architect be not less than 35 and not more than 50 years."

Mr. Edwards moved the adoption of these recommendations, which, after a discussion, were put and agreed to by a large majority.

Mr. Selway then moved that the resolution of the Board of July 2, "That the duties of the office of superintending architect do remain as at present," be revoked. He did not ask the Board then to deal with the subject, but asked them to let it go back to the committee for a free and full discussion. Under section 52 of the Building Act the superintending architect was required not to undertake or deal with any duties but such as the Board imposed upon him, and he certainly thought they had acted wisely in making such a regulation. He found that the superintending architect was to do nothing but discharge his duties to the Board. When any subject or matter arose which the engineer or solicitor was unable to deal with it had to go to the superintending architect for him to do so. He also found under the regulations that he had at one time to deal with all matters connected with the storage of petroleum, but that had very properly been placed in other hands. There were the district surveyors, and the superintending architect had to supervise the whole of their duties, to arrange the lines of frontage of buildings, a large number of which were brought before the Board every year, and every one of these the superintending architect was expected to see with his own eyes. He also had to superintend the laying out of new streets, and to give advice upon them, which required not only a large amount of general but of structural knowledge. The Board had also placed him in charge of the Fire Brigade stations in every part of the metropolis, and he also had to superintend the arrangements for parks and open spaces. The entire subject of labourers and artisans' dwellings was under his direction, and with all these duties combined he certainly believed that they were quite enough for any human being to undertake. He had taken the trouble to go into the figures, and he found that during the last six years the Board had voted for public improvements no less a sum than six and a half millions—that is, more than a million a year had to be dealt with by the superintending architect, from which sum the Board derived 100,000*l.* from ground rents annually, and they held land of the value of 2,500,000*l.* He thought, therefore, it would be well to see whether some rearrangement of the duties could not be made in the future by a division being made between those of the superintending architect and chief surveyor. He moved that the subject be referred to the committee of works and general purposes for consideration.

Mr. Jones seconded the motion.

Mr. E. R. Cook hoped that the Board would not agree with the resolution, as the subject had been fully discussed, the duties and salaries having been agreed to, and it would be simply a waste of time to go further into the question. Instead of seeking to separate the duties of superintending architect and chief surveyor, they ought rather to try and concentrate them and bring them into a harmonious whole. As the whole matter had been well discussed, he trusted that the Board would not consent to reopen the question.

After some further discussion the motion of Mr. Selway was negatived by a majority of 28 to 22.

THE ARCHITECTURAL ASSOCIATION.

THE third ordinary meeting of the Association was held on Friday last, Mr. J. A. Gotch, president, in the chair.

The President, referring to a notice that had been circulated among the members with regard to a proposed memorial to the Queen, said that the Association was not concerned with what he might call the matters political of the profession to any extent, but as an educational body they were greatly interested in the supplementary part of the proposed new charter, which dealt with educational advantages, particularly in connection with examinations, and, being an educational body, they should do what they could to support the passing of the supplementary charter. He proposed the following resolution :—"That the Architectural Association should memorialise the Queen in Council, in support of the supplementary charter presented by the Royal Institute of British Architects, inasmuch as it will, if granted, materially advance the special educational objects which the Architectural Association has in view."

Mr. Leonard Stokes seconded the resolution, and it was carried by acclamation.

Mr. J. D. Sedding then read a paper, from which the following is extracted, under the title of

Notes on Church Planning.

Mr. Sedding said :—Do not take up this or any other subject as unfledged specialists. Nowadays we have our "church," our "house," our "café," our "workhouse," our "theatre" architect. If you have brains to dispose rooms charmingly, an eye for the picturesque, and a nose for drains, you will be ticketted a "house" architect. If you have done a passable thing or two in church design, you will be dubbed a "church" architect, and will be expected to know all the conventionalities of that modern trumped-up trade called by log-rolling advertisers "Ecclesiastical Art." To do one thing passing well nowadays would seem to prove your inability to do anything else. For a young man with a future to cultivate one branch of an architect's work at the expense of the rest is bad, for it is bound to make him and his work groovy, modish, and partial. If you have special aptitudes time will discover them, and you may some day find that a grateful world has turned you into a specialist ; but in the meantime be a free man. To any young man about to become an architect I would say that while he cannot begin to study architecture too early in life, he can't delay cultivating himself into a specialist too long. Having eased my mind, I can proceed more freely. No one here is

going to be a mere "church" architect, yet one and all are going to build churches, and are as anxious as I am to build them aright. The treatment I propose to follow, and ought, is first to consider church planning historically, and then practically. I cannot wander all over Christendom, however, to demonstrate the enormous varieties of church plans that exist, nor the causes of variety. I cannot treat of the changes of outer forms and architectural ornament, the improvement of constructive skill and the rest of it—nor can I deal with the grammar of the science touching domes, vaulting, arches, and features such as you are so admirably instructed upon in your classes. This is only a telescopic, and not a microscopic, treatment of this vast subject.

Mr. Sedding, having considered the purpose for which a church is built, went on:—So much for my telescopic view of the basis of the science of church planning, and for the character and underlying *motif* of a church plan. There are, as I have said, such a variety of types—each type having its own nursery-ground of local initiation and its sequel of wider influence when transplanted into the great garden of the world—that I must leave the whole of this side of the subject alone. But, for reference only, let me send you to Willis's "Architectural History of Canterbury Cathedral" for an admirable insight into early church planning as demonstrated by his researches at Canterbury. He shows how Augustine and his monks brought with them the ideas of their native land; how they produced at Canterbury as far as possible the Italian basilica that has since proved so fruitful a type to English builders. This and vastly more you will find in this most lucid history written by a man of learning, of trained instinct, and deep historic sense. To speak of the Basilican type of our churches and of the "Canterbury influence" is, however, to tell only half the tale. For the rest, go to Mr Micklethwaite's capital little tractate upon "The Growth of English Parish Churches": he here demonstrates that just as the English Church traces her origin partly from the ancient British Church existing in the land before the coming of the Saxons, and partly from the Romans through the mission of St. Augustine at the end of the sixth century, so the buildings in which she worships show evidence of having been derived from the same two sources. Let me also refer you to Mr. G. G. Scott's most valuable "History of English Architecture," and to Mr. Birch's learned treatise "Concerning the Fabric of the Church and the Form Thereof," which appears in the Transactions of the S. P. E. S. It suits my purpose now to glance at the development of primitive types of church planning, as seen in different countries. In northern lands there are the churches of Canterbury, Wells, Maulbroun, Gelnhausen, and Albi—all typical, and all with their screens and nave altars. The Italian type is very different, even though monastic hands reared these fabrics as well as the English and the other instances named. The characteristics of the two Florence churches of St. Croce and Sta. Maria Novella and the church of St. Domenico at Siena is that these churches take the shape of the Tau, there being practically no upper arm to the cross that forms the basis of the outline of the church. Further, in the southern type nearly the whole of the church is given up to the people's use, while in the northern type the choir and sanctuary which the monks and canons appropriate consume usually a full half of the whole church. Our parish churches were largely built by or under the direct influence of the monastic orders, England being practically converted by them. The Benedictine influence was very prevalent. Mr. G. G. Scott sums up what, in his opinion, are the characteristics of English parish churches thus:—1. Square end. 2. Transepts lower than nave, and not forming a crossing bay in the nave. 3. Central western tower. Mr. Scott holds that, with rare exceptions, a tower should always be on the centre line east and west of the church, either at the crossing or in the centre of the west end, the former being the collegiate or conventual type, the latter the parochial. And now, having epitomised the history of church planning so far as was necessary to carry me onwards to the purpose of this lecture, we will look at church planning as a practical science.

In planning a new church, having settled your general proportions, begin planning at the altar. This is God's house, and there are certain matters connected with the decencies and dignities of worship which are arbitrarily required, and it is well to comply with these at the outset. The altar will be of variable length, from 6 feet upwards, to suit the width of the church, and from 3 feet 3 inches to 3 feet 6 inches high. One finds the tables of modern altars as much as 3 feet wide, even where the space in front is cramped for room; but 1 foot 9 inches or 2 feet is ample for the ministrations of the priest. The foot-pace, or planum, should never be less than 3 feet clear in front of the altar, and the deacon and sub-deacon's steps from 2 feet wide. Having arranged for these three steps, as many more may be added as the size and character of the church demands. The method of returning the upper steps is rarely found in old English churches: the Benedictine builders used to carry all the steps across the chancel unreturned at the sides, as may be seen, for instance, in Gloucester Cathedral at the high altar and the Lady-altar. A common but cruel error, both for priest and communicant, is that of placing the communicants' rail on the topmost of two steps set close together. I have economised space in planning a new chancel by making the low chancel screen do duty as communicants' rail, as one sees done abroad. I need not here urge what is becoming a thing generally accepted as needful and right, a second altar for early celebrations. I remember that on our Oxfordshire excursion we came upon several churches where second altars were provided, and the practice commended itself even to some of us who are not churchmen as both convenient in itself and as adding wonderfully to the artistic interest and furnished character of the sacred building. Vestries should be large and conveniently placed. It was the Bishop of Liverpool who said the other day that modern vestries were mostly like the Black Hole of Calcutta.

Chancel seats vary according to the size of the church. I do not know that we gain much by having return stalls, except by pleasing what the Americans call our desire for "archæological accuracy." But I should always put them in an old collegiate church, and wherever desired by the bishop. Avoid the isolated parson's desk in the chancel, it is an abomination. Put it out in the nave without a scruple, if it is wanted. My notion of a really popular service is, however, to have the minister in the pulpit as they do in Nonconformist chapels and Roman Catholic churches. Avoid ugly gaps in chancel or nave seats. The chancel seats in new and restored churches mostly give one the impression of having been chucked down by the carpenter when the dinner whistle went, and he never finished his job. Surely, as in houses so in churches, furniture should fit into a place. I know that Mr. Redtape would be shocked to know that any one advocated the hacking away of stonework in order to fit your seats into their places; but, then, he is a man accustomed to strain at gnats and swallow camels.

What the old masters did I do, and for the same reasons, and in the same unscrupulous manner. Nave and aisle passages should be as wide as possible—aisle passages never less than 5 feet wide, to allow for processions, if you can get the room, and always provide a good space in front of the chancel screen, and an unbenched bay at the west end of the church, if possible. That there should be screens to fence off the chancel from the rest of the church, both a sense of reverence and an eye for art would seem to demand. A high screen always gives interest and scale to a church. What a pitiful sight is an old cathedral victimised into an unobstructed tunnel for the sake of a vista: why, one can get a longer vista down Gower Street any day. As to screens, the question whether your screen is to be high or low, close or open, should be determined by reference to the character of the people for whom the church is built. Cultivated people like close screens of wood or iron; poor people like low screens, or open screens, if high, and they like a large rood, with the figure of the Saviour upon it, and this will either rest on your high screen, or, if there is no high screen, upon a trussed beam across the church. Always endeavour to get parclose screens: they add much to the artistic effect of a church where are arches opening into chancel aisles.

The question of galleries is growing in importance. The churchman does not like them because they smack too much of the auditorium, with their stepped seats varied in height, and the architect thinks they are apt to destroy dignity. But where they are in the mind of the architect from the first they can be made to produce excellent effect. Mr. Pearson's churches at Kilburn and Red Lion Square show what effects can be got by galleries by a skilled architect. The Jesuits' Church at Antwerp gives an admirable treatment of galleries where they have even got altars at the east end of galleries. A most interesting Mediæval example of galleries is to be found in the church at Flavigny, in France, where galleries stretch over three south aisle chapels, at the west and east ends of the nave. (See King's "Mediæval Architecture," vol. i.)

I venture now to give a few detailed examples from cases that have arisen in the course of one's own practice. An ounce of demonstration is worth many pounds of theoretic talk. I spoke just now of the misery of a pinched sanctuary. The treatment I have followed at St. Matthew's, Sheffield, and hope to shortly carry out at another modern church, St. Bartholomew's, Bethnal Green, is to add to the length of the chancel by absorbing into it the first bay of the nave. True, I am taking from the body to give to the head, but the head was disproportionate, and I am only making it of the proportionate size it should have been from the first.

In the case of a new church the local committee objected to the waste of space in my sanctuary, which was really not an inch too long. So I reduced it by bringing the east wall 6 feet further west, and I took a corresponding space out of the nave beyond the structural chancel, and so it is built, and everyone is pleased, myself included. At Henley-on-Thames I have to deal with a somewhat difficult problem. Here is a church with a peculiarly scattered wide plan—a church with nave and double aisles (one a modern aisle), and the chancel a mere

tunnel, with choir-seats so closely packed together that you can barely sit in them. If there is to be a "popular" service with a large choir here, it is clear that the choir must be brought out of the tunnel into the nave, which is what I propose to do.

At Box Church, Wilts, is a case of even more problematic character. Not only is the chancel very narrow, but the central tower is narrower still, only 12 feet across, and the tower arches very low. To complicate matters, the church demands extension. The radical "restorer" would pull the old tower and chancel down, which ought never to be done. By bringing the choir west of the tower, and by forming a sanctuary under the tower, this destruction is avoided.

At Axbridge, where there is a long chancel and central tower, and wide nave with nave aisles, we have brought the choir under the tower. But in this and the other cases the old single row of stalls with "returns" have been restored in the old structural chancel. In Axbridge Church, as at Chard, the altar is projected some feet from the east wall. Practical reasons, such as affect the ordinary administration of worship, seem to me to justify such disturbance of the nave or chancel arrangement as I have indicated. No structural alteration is entailed in either of the cases named: in fact, the old structural chancels are made as they were in time past, return-stalls and all. Of restoration generally I would say—save all you can of the immediate past, recover all you can of the far past, and accommodate things as well as you can to the wants of the living church at the least cost to the history of the building.

I had purposed to make a few detailed remarks upon the subject of cathedral church planning, and, with Mr. Beresford Pite's valuable collection of cathedral plans before me, it is hard to resist, but time will not permit. On one point only I should like to say a word. At the outset we considered church planning (including cathedrals) historically, and afterwards we dwelt upon its practical side. Now it seems to me that if there is one feature more than another that has historical and practical value in our cathedrals—one feature that connects them with the past, and renders them practical for Divine worship of the approved popular kind in the present day—it is the choir-screen. There is a wonderful consensus of opinion among both ecclesiastics and architects about the folly of our cramming our ordinary Sunday congregations into the choirs of cathedrals. No one defends the practice. Every one knows it to be in direct violation of the intention and true capacities of the fabric, and yet in desiring to mend matters the thoughts of reformers run only upon destructive and not upon constructive lines. They like to be radically original, to show what bold reformers can do. There are two ways of meeting the difficulty about the choir-screen that cuts our cathedrals in twain. The first way is to shirk the root of the matter by doing something that, while it relieves the strains upon the choir, does not really advance the popularity of the service in which a nave congregation is supposed to participate. The present undignified, huddled-up arrangement of a cathedral service in choir is "popular" just because it is centralised—altar, singers, canons, congregation all together. But once decentralise the service, and the "popularity" of the service is gone—only pedants like it. The altar, the singers, the canons are far away. To cultivated people who use service-books it does not much matter whether the altar is 400 feet or 500 feet distant. Their minds follow what their ears cannot catch. But to poor people everything should be centralised, open, and easy of access. To remove the screen, then, is not to untie the knot; it is only to cut it.

It is a scandal to the English Church that she cannot make the naves of her cathedrals as useful for Sunday popular services as the choirs are for the week-day choir offices. The old builders knew their ground; they knew what they wanted, and they provided it. The old builders had to meet precisely the same case as ours—they had to provide a popular service for the people in the nave, and so they put a people's altar in the nave—perhaps under a canopy—and if we were not so pig-headed and prejudiced nowadays, we should meet the same identical needs by using the same identical means. Lord Grimthorpe has done many execrably foolish things at St. Albans, and has given to the nineteenth century a supreme example of how *not* to restore an historic building; but at least to him be given this negative praise—he has not *yet* removed the nave altar and stone screen behind it.

Mr. Sedding then passed to the consideration of the collection of modern church plans lent to him for the evening's lecture, noticing in the first place that Gothic still held the field.

The PRESIDENT, in opening the discussion, among other comments remarked that notwithstanding Mr. Sedding had so ably set forth his type of church, it was often the case that committee-men held views more nearly approaching those of the men of Wren's times, and that the High Church plan would not be adopted in every case, nor for congregational churches. Also, in referring to Mr. Sedding's remark that so many during the excursion left churches to sketch cottages, he said that it would not fall to the lot of all to build so many churches as Mr. Sedding, and many no doubt were intent on solving problems that would more nearly concern them than those of church building. He himself had noticed of late that students seemed to have turned their attention more to domestic work.

Mr. WM. WHITE, F.S.A., proposed a vote of thanks to Mr. Sedding for the paper. He spoke of a distinctive feature in English churches, namely, a thoroughly well developed chancel. As to chancel steps, it was not so much a question of the number of steps at the chancel arch and altar as of their being so graduated as to give good perspective to the chancel as seen from the nave. Chancel stalls should be neither too high nor too crowded. The opposite practice was far too common in the small village church, the result being that the chancel was lowered, and dignity of effect was lost. The old Mediæval stalls of Lincoln Cathedral were far lower. A church should not be planned with the largest possible nave and the narrowest of aisles, for care must be taken as to proportions, or the acoustics of the edifice would suffer. If limited for money, effect must at times be sacrificed for accommodation, and then they must have recourse to aisles—to broad aisles.

Mr. E. C. Robins seconded the vote of thanks, which was supported by Mr. Hudson and Mr. Vacher. It was passed by acclamation, and the meeting closed after a few words from Mr. Sedding.

LIVERPOOL ARCHITECTURAL SOCIETY.

A PAPER was read at the meeting on Monday, by Mr. J. H. M'Govern, on "Antiquities of Kirk Braddon Cemetery and Peel Castle." He stated that Ptolemy classed the Isle of Man under the head of Irish islands, and the Manx race belonged to the Goidelic branch of the Celtic race. In referring to the runic crosses at Kirk Braddon, he said the difference between the Celtic and the Scandinavian runes was that the former were known by their ornaments of geometric interlacing knotwork and Celtic names, and the latter by their draconic ornaments and Norse names. The inscriptions are in a Norwegian dialect and written with a Scandinavian alphabet, the letters of which are termed runes, and the alphabet bears the name of the Furthork from the first six runes. The origin of the runes has been held to be from the Hellenic alphabet in the Greek colonies on the Black Sea, sixth century B.C. After referring to the historic associations of Peel Castle, made famous by the author of "Peveril of the Peak," Mr. M'Govern spoke about the Round Tower in the castle grounds, which he held to be of Irish Celtic design, and that the round towers were used as belfries for summoning people to worship in connection with chapels, and not as some authorities hold, as watch towers, like the Danish ones, or as ecclesiastical prisons.

THE EDINBURGH INTERNATIONAL EXHIBITION.

THE Executive Council of the Edinburgh International Exhibition met last week. The most important subject which came before the meeting was the request from the recent meeting of medallists, that an extraordinary meeting of the Association should be called to consider the desirableness of providing gold, silver, and bronze medals for the exhibitors who were successful in gaining awards. Nearly an hour was occupied in the discussion of this matter, in the course of which more than one member called the attention of the meeting to the fact that the request was not that the Council should deal with the question, but that they should merely call a meeting of the Association for the purpose. A majority decided that the Executive Council do not provide the successful exhibitors with medals, but that they should abide by the terms of their regulations. Another subject discussed by the Council was one which has been creating some little stir in fine art circles since the close of the Exhibition. It appears that at the commencement of the Exhibition there was an agreement come to between the executive and the artists exhibiting pictures in the galleries, that when any of the works were sold 10 per cent. on the catalogued price should be retained, evidently by way of commission. In many cases the pictures disposed of were sold at prices considerably lower than that stated in the catalogue, and a number of the artists, it would appear, now demur to paying the percentage originally agreed upon and declare that it should be exacted only upon the actual price realised; while others, it is understood, have suggested that in view of the financial success of the Exhibition, they should receive the full price without any deduction. Considerable sympathy was expressed by members of the Council with these views, and on the motion of the Lord Provost it was decided that the Fine Art Committee should be empowered to pay over at once to those artists whose pictures had been sold the price realised, less 10 per cent., and the hope was expressed that the percentage might be refunded to them when the accounts of the Committee

have been squared. The Council agreed to vote 50*l.* to Miss Dunlop for services rendered in connection with the publication of the book of "Old Edinburgh." The latter part of the meeting was occupied with receiving reports from various committees. The work of dismantling the buildings, it was stated, is proceeding rapidly, already three of the courts having been taken down. It is intended to advertise the Grand Hall for sale, and the material of the temporary portion will as soon as possible be sold by auction. Old Edinburgh has not yet been touched. The Committee expect a communication from Paris at an early date, making an offer for the building, and until then it will be allowed to remain.

THE IMPERIAL INSTITUTE.

IT is officially announced as a result of the meetings which have been held of the Prince of Wales's Committee on the proposed Imperial Institute, of the Colonial representatives and of the Exhibition Commissioners, that though the Queen will lay the foundation-stone of the Imperial Institute next June, it will probably not be opened for three years, as it will take at least that time to get the buildings ready. It has been decided that the Exhibition will not be reopened next year in any form. Most of the Commissioners are rapidly dismantling their courts and returning exhibits, as they could not be left in sheds for three years. If possible, the buildings lying between the new public offices in Whitehall and Great George Street, Westminster, which belong to Government, will be pulled down and the Institute established there. It is suggested that the Colonies should occupy the ground floor, and the mother country the floor above, the Agents-General also being located in various parts of the buildings, which will have an area of 400,000 square feet. In this case the city scheme will be united with the Prince's. If this ground cannot be obtained, then a purely exhibitional arrangement will probably be made at South Kensington, and a commercial museum in the city. It is understood that none of the present Exhibition staff will be retained. The estimate of the cost of the building is 300,000*l.*

The sub-committee of the Imperial Institute Committee have also conferred with the Agents-General for the Colonies. The Committee have agreed to advise His Royal Highness that it would not be expedient, as part of the scheme of the proposed Jubilee Memorial Institute, to reopen the present exhibition in the same or a similar form next year, and that it would not be practicable at so early a date to open a new Institute. The Committee are now considering what form the proposed memorial should take, but they have at present arrived at no conclusion upon the point, and have not tendered any advice to His Royal Highness upon it.

MEDIÆVAL GUILDS.

AT the meeting of the Edinburgh Architectural Association on the 18th inst. the following paper was read by Mr. Colston:—At no time in the history of our country has there existed a greater desire for information regarding our ancient laws and customs than at present. It is probable that the publications of two societies—one in England and the other in Scotland—have contributed largely to this archæological taste. We refer to the publications of the Early English Text Society, which contain much valuable information, and to the volumes that have been issued by the Scottish Burgh Records Society, under the able editorship of Dr. James David Marwick, town clerk of Glasgow. The subject is one of wide-reaching interest, and by the dissemination of accurate information in regard to it, the past may be made to speak to the present, and both combined may be made to speak to the future. In those days, when the question of Local Government is obtaining so large a share of public attention, and when there exists a great diversity of opnion among all classes of politicians as to what would be a satisfactory solution of the difficulty, any contribution, however small, which has a tendency to disseminate a knowledge of our ancient laws and usages cannot fail to be one of public interest.

The general desire throughout France and over Europe to get rid of the feudal control, and to establish municipal rights and freedom in towns and large communities, led to the establishment of guilds. This also was the case both in England and Scotland. Mr. Hensleigh Wedgwood thus describes the origin of the word "Guild," namely, "Danish *gilde*, feast, banquet, guild, or corporation; Platt-Deutche *gilde*, a company, corporation, society of burghers meeting on stated occasions for the purpose of feasting or merrymaking. The primary meeting is a feast, then the company assembled; and the same transference of signification will be observed in the word 'company' itself, which, signifying in the first instance 'a number of persons eating together,' has come to be applied to an association for any purpose, and in the case of the city companies (of London) to the very associations which were formerly denominated guilds."

Writers on the subject of guilds have placed these in four distinct classes:—1. The Family Guild; 2. The Religious (or Social) Guild; 3. The Mercantile (or Town) Guild (the Frith Guild); 4. The Crafts (or Trades) Guild. It will be abundantly evident that the Family Guild must take precedence of all the rest. In a state of society when there was comparatively little association or intercourse, as following out the old patriarchal method, the family roof was naturally looked upon as the centre under which all the dependents on the head of the house must come. But, as time rolled on, and civilisation increased, and enterprise was developed, a new state of things began to be evolved, namely, the creation of associations—or rather unions—with the most pious intentions, flowing out of a most generous sympathy for their fellow men, one of the finest traits that is to be found in human character. Concerning guilds of England, which can be traced back to the eleventh century, issuing their statutes from time to time, it need not be surprising from what we have already said, that the first inception of these was largely mixed up with religious worship. The Cambridge Guild was established for very different purposes. It was a union of brethren, the object of which may be defined in two words, help and defence. Its results, therefore, might have a bad as well as a good tendency. While there was one friendship, there might exist also one enmity, in respect that it was a brotherhood sworn to avenge every insult, a personal affront being regarded as a common one. The Judicia Civitatis Lundoniæ, or Statutes of the London guilds, which were reduced to writing in the time of King Athelstan, seemed to have been passed for a similar purpose to those which were enacted at Berwick-upon-Tweed in 1284. In consequence of these statutes, all smaller guilds were merged into one great guild, which developed a better system of police than had previously obtained, by framing regulations for the good government of the town. Every month there was a common meal, at which the general interests of the guild were discussed, and the remains of the viands after the feast were given to the poor. One very strange statute consisted in this, that when a brother of the guild died every member had "to offer a loaf of fine bread for the benefit of the soul of the departed, and had to sing fifty psalms, or get them sung, within the space of a month." It may thus be safely assumed that love, friendship, and good fellowship were the motive powers in the creation of the religious and social guilds which existed to so great an extent all over Europe in the Middle Ages.

While to a certain extent the same elements characterised the mercantile and trades' guilds, which began to flourish and rapidly increase in this country in the fourteenth, fifteenth, and sixteenth centuries, yet in these organisations is to be found a large amount of self-interest. In fact, they were protective associations, for the benefit of those who obtained the privilege; and as apprentices were indentured to and lived with their employers, they too became an integral part of the same system. In Germany there are hardly any records of guilds during the Middle Ages. Brentado attributes this to the measures taken for their suppression by the princes and bishops. Nevertheless, at a later period, there seemed to exist the most intimate relations "the highest guild" (*summum convivium*) and the town, which became, according to Wilda, one of the greatest authorities on the subject of guilds, "the germs of the towns' constitutions." This, also, as we have sought to prove, was the case in this country. In regard to Germany, the most important of these frith guilds were those of the Rhenish towns. Possibly the most elaborate system of statutes of towns' guilds which any nation can show comes from Denmark. It is supposed that their system had been transplanted about the middle of the eleventh century from England to that country under King Canute. This would appear from the fact that they placed themselves under the patronage of what they termed three royal saints of the land, namely, St. Canute, the king; St. Canute, the duke; and St. Eric, the king. The functions of both were to maintain law, security, and order. There was an alderman as presses of the guild, and sergeants or stewards to support him. A pure life and undefiled character, and a spotless reputation, were the conditions of guild freedom, and each one had to take the *sacramentum* (oath) for preserving inviolate the statutes of guild. We need not say that the towns' guilds were chiefly mercantile. Like the modern so-called "factories," which exist in North America, Asia, and Africa, the merchants being the most important trading body in the community, speedily saw and carried into effect a system of municipal rule for self-protection, and for the peace of the community. The division of labour principle which, in these later times, has exercised so large an influence in the production of commodities—in the way of expedition and cheapness—was no doubt at this time beginning to exercise a certain effect. Brentado tells us that, in consequence of this state of matters, "an ordinance was repeated in Danish,

German, and Belgian guild statutes, that no one 'with dirty hands,' or 'with blue nails,' or 'who hawked his wares in the streets,' should become a member of the guild, and that craftsmen, before being admitted, must have foresworn their trade for a year and a day." Eventually, however, as a rule, the craftsmen were excluded from the guild, and became oppressed by it, which frequently led to civic dispute and turmoil. Nevertheless, let us not condemn these guilds. They served their day well. But municipal independence, with emancipation from lordly control, having been attained, the old and honourable spirit of freedom seemed quickly to die away. The municipal rulers became proud, avaricious, and overbearing. The exclusion of the craftsmen from the brethren of the guild was a step in this direction, which soon led to a system of oppression on the part of the latter towards the former—the guild being the local governing power. Great was the party spirit, and numerous were the conflicts, which took place during the thirteenth and fourteenth centuries.

Towards the end of the fourteenth century the trades guilds prevailed. They were successful in obtaining a share in the civic administration. The origin of the craft guilds, it will thus be seen, was occasioned by the necessities of the period. Combination was the only way by which they could successfully resist the oppression of the mercantile guilds. Foremost among the craft guilds were the weavers, who were a kind of middle class between patrician and plebeian. The craft guilds, at an early date after their institution, began to see that it was indispensable to have a responsible elected chief. This official they called "the warden," whose duty was to regulate the trade and manage the guild. While trades guilds, or craft guilds, became prevalent in England, as they were also on the Continent, there seems to be no evidence whatever of their existence in Scotland, in so far as can be traced from the earliest records of the Scottish burghs. Nevertheless, the same feelings appeared to be at work, and the same desire for oligarchy which prevailed among the members of the merchant guild can easily be traced, for they became the frequent cause of civic disputation and strife. The mercantile portion had, however, eventually to give way, and to admit the trades to a certain share in the municipal management and control. Further, the town councils granted them the privileges of incorporation, by what is known as a seal or cause. Had it been practicable for mankind to have remained in a state of primeval simplicity, the cultivation of the arts and sciences would have been altogether unnecessary. Man would have continued to have lived in a state of comparative barbarism. But as society increased, and as men began to regulate the affairs of their every-day life by craft, ambition, and emulation, it became absolutely necessary to institute a more permanent and exclusive right to the soil. But though opportunity was thus afforded to cultivate those arts which have raised the human species to their present dignified position, there were various elements which tended to prevent it. Men as yet unpractised in policy and discrimination sought no other protection against violence and injustice than the selection of a few persons who had distinguished themselves in the chase or in the field, and in these practically was vested what might be termed the exercise of civil government. It was practically to put an end to such control that the frith guilds were called into existence. They offered a noble resistance to, and eventually conquered, the baronial control, and they were the first organisation to develop the grand idea of a free popular civic administration.

THE ELLAND TOWN HALL COMPETITION.

THE following architects sent in plans for this competition, the number being less than usual owing to the peculiarity of the conditions:—Mr. C. F. L. Horsfall, Halifax (two); Messrs. Collings & Lockwood, Huddersfield; Mr. Walter Hanstock, Batley; Mr. E. W. Farebrother, Grimsby; Mr. John Lord, jun., Brighouse; Messrs. Horsfall & Williams, Halifax; Mr. H. A. Cheers, Twickenham; Mr. J. Crawshaw, Ripponden; Messrs. Jackson & Fox, Halifax; Mr. R. F. Rogerson, Brighouse; Mr. T. C. Hall, Bradford; Mr. George Hepworth, Brighouse; and Messrs. Walsh & Bulmer, Halifax and Bradford.

It was unanimously resolved by the directors that Mr. Horsfall's design, marked "Interest," should be adopted subject to any alteration the directors may desire to make, and subject also to the tenders, when received, being such as can be accepted. The secretary to the company, Mr. J. L. Garsed, was directed to convey the thanks of the directors to the gentlemen who sent in plans.

According to the *Halifax Courier*, the accepted design is Classic in style, and the building will present a handsome, substantial, and imposing appearance. When erected it will be in two blocks, and have three frontages, the main being to the junction of Southgate and Huddersfield Road respectively. The Southgate wing will include the large hall, and the principal entrance will be from the chief frontage, there being also a side entrance to the back seats and gallery in Southgate. The landing to the large hall will measure 24 feet by 20 feet, and the hall itself will be entered from a corridor 8 feet wide. The large hall will be 100 feet long by 46 feet wide. The body of the hall will measure 70 feet long by 46 feet wide, and the platform 30 feet long by 46 feet wide. The platform, it may be stated here, will be arranged so that it can be used as a lecture room when the large hall is not required. This will be done by means of revolving shutters which will lift up from under the platform, and the size of that room, so formed, will be 46 feet by 27 feet. The height of the large hall, from floor to ceiling, will be 30 feet, and over the back seats of the hall will be a gallery 46 feet wide by 20 feet deep. The body of the hall will be made to seat 810 persons, and the gallery 240, making a total accommodation of 1,050 persons. The floor will be concreted (fireproof), so as to make it solid, and then boarded, preventing any sound being heard below. The heating will be by hot-water pipes, to be fixed down the sides and centre of the hall. The room will be ventilated from the windows by inlet fresh-air flues, and outlet flues in the ceiling, to be carried in the roof to turrets. Underneath the large hall will be two lock-up shops, a keeper's house, and four shops with living accommodation. These shops and houses are to be so arranged that the shops can be let off as lock-up shops, and houses let off separate from the shops. At the entrances to the large hall will be ticket offices, cloak-rooms, and other accommodation. The Huddersfield Road building will include one lock-up shop, and five shops with dwelling-houses to each. The outwalls are to be built of flat-bedded stone, with boasted ashlar dressings with cavities, and relieved with pilasters. The woodwork will be of red memel and yellow pine, fit up to correspond with the building in design. The total cost, including heating, lighting, ventilation, and drainage, the architect states will not exceed 5,000*l*.

EXAMINATION OF LOCAL SURVEYORS.

THE following papers were given to intending candidates for local surveyorships at the last examination at the Sanitary Institute:—

1. Mention the chief Public Health and other Acts in force relating to:—(*a*) Water supply; (*b*) sewerage. Give a brief statement of the main features of each.

2. Define a by-law. What is meant by—(*a*) Provisional order; (*b*) special drainage district; (*c*) contributory place; (*d*) inquiry by Local Government Board; (*e*) power of entry?

3. What are the chief principles to be observed in the sewerage of a town or district, and how would you proceed to determine the size and capacity of the outfall sewer? What size of sewer would you propose for a town of 20,000 population where the gradient is 1 in 300? Illustrate your answer by sketches.

4. Write a specification for laying stoneware pipe sewers.

5. Supposing a sewer to have a gradient of 1 in 300, how much would the velocity and discharge be increased by altering the gradient to 1 in 100?

6. Give a description of the process termed intermittent downward filtration. State what area of land you would require with a gravelly soil for applying this method of purifying sewage to a town with a population of 20,000 inhabitants; and state the arrangements you would adopt for dealing with the rain-water falling on the roofs, yards, and streets.

7. Describe and illustrate by sketches the essential points to be observed in carrying out a system of house drainage, and the best means of providing urinal and closet accommodation for schools, workhouses, and similar institutions.

8. In arranging the water supply for a manufacturing town of 30,000 inhabitants, state what you consider of importance as to—(*a*) Sources of supply; (*b*) quantity required; (*c*) distribution.

9. Describe the general characters derived from—(*a*) The chalk; (*b*) the new red sandstone; (*c*) the carboniferous formations; and the methods by which water should be obtained from each.

10. In what ways is water liable to be polluted after collection, during its distribution to houses, and in houses? What means would you adopt to prevent such pollution?

11. What fittings, and plumbers' work generally, are required for a high-pressure constant water service? How would you make the connection with the main? Describe the kinds of joints which should be used on the branches.

12. There is great difficulty in obtaining a supply of good water for a country house, and it is therefore necessary to obtain as much water as possible from the roofs, and to use it for drinking and cooking purposes. The total area of the roof of the house and offices is 8,000 square feet, and the average annual rainfall is about 40 inches. Calculate what size the

storage tank should be, and give a sketch of it and its appendages.

13. To what extent does the size of a room affect the quantity of fresh air required for effective ventilation, and what quantity of air would be required per hour for a room containing 8,000 cubic feet, occupied by fifteen people? How would you ventilate such a room? Illustrate your answer by sketches.

Bygones.

"*Antiquity after a time has the grace of novelty.*"—HAZLITT.

DE PILES'S "BALANCE OF PAINTERS."

THERE are two names in the art literature of the seventeenth century which must always have an interest for Englishmen, viz., those of Charles Alphonse du Fresnoy and Roger de Piles. Both men were painters as well as writers, and the reputation of both is inseparable. Du Fresnoy was the author of the Latin poem *De Arte Graphica*, or "Art of Painting," which was dedicated to Colbert. It was brought out in 1688 with a prose translation in French, by De Piles, on alternate pages. Few books were more honoured. John Dryden did not think he was demeaned by undertaking a translation of it. "Many of our most skilful painters and other artists," he said, "were pleased to recommend this author to me as one who perfectly understood the rules of painting, who gave the best and most concise instructions for performance, and the surest to inform the judgment of all who loved this noble art." Indeed, according to Dryden, the poem was supreme as an authority, for "Bossu has not given more exact rules for the epic poem, nor Dacier for tragedy in his translation of Aristotle than our Fresnoy has made for painting." But "Glorious John," although he stood at the head of English writers, was not ashamed to say that he was not sufficiently versed in art for the translation of such a masterpiece. "I freely own," he said, "that I thought myself incapable of performing it, not but that I understood the original Latin and the French author perhaps as well as most Englishmen, but I was not sufficiently versed in terms of art." The youngest reporter would now scorn to make such a confession. Dryden said he borrowed two months for the translation from his "Virgil," and the fine essay, called a "Parallel of Poetry and Painting," which he prefixed to it, was written in twelve mornings. The translation appeared in 1695.

A further honour was paid to Du Fresnoy and De Piles when Pope sent a copy of Dryden's translation to Jervas, the portrait painter, with a poetic epistle. Mason, the poet, also translated the original into English, and Sir Joshua Reynolds imparted value to this version by his notes.

Of the two Frenchmen whose names are inseparably associated De Piles was the more voluminous writer. Between 1677 and 1684 he wrote "Conversations on Painting," "Dissertations on the Works of Famous Painters," and the "First Elements of Practical Painting," all of which were accepted as standards in their day. De Piles was, however, most esteemed for his attempt to assess the respective values of the great painters by means of figures, and which we now reprint. What connoisseurs thought of his numerical valuation may be judged by the criticism which the Abbé Du Bos passed upon it. In his "Réflexions Critiques" he says:—"Monsieur De Piles, a grand amateur in painting, and who also handled the pencil, has written much on the art with which all the world should be acquainted, but there is one of his writings which is worthy of all the praises that are given to original works. Everybody can there see at a glance the merit of any painter in each of the four parts into which the art of painting is divided." Du Bos was of opinion that there ought to be five divisions instead of four, that is, he would divide composition into picturesque composition and poetic composition. He maintained that it was hardly correct to make Nicolas Poussin have the same value in composition as Veronese, although, according to Du Bos, the Italians gave the precedence to the Frenchman, as they considered him superior in the poetry of painting to Paul Veronese.

The following is De Piles's "Balance," with his introductory explanation of the process he employed:—

The method I have taken is this:—I divide my standard into twenty parts or degrees. The twentieth degree is the highest and implies sovereign perfection, which no man has fully arrived at. The nineteenth is the highest degree that we know, but which no person has yet gained. And the eighteenth is, for those who, in my opinion, have come nearest to perfection, as the lower figures are for those who appear to be further from it.

I have passed my judgment only on the most noted painters, and in the ensuing catalogue have divided the chief parts of the art into four columns, viz., Composition, Design, Colouring, and Expression. By Expression I mean not the character of any particular object, but the general thought of the understanding. And thus against each painter's name we see his degree of merit in all the aforesaid divisions.

We might introduce among the most noted painters several Flemings, who have very faithfully shown truth of nature, and were, moreover, excellent colourists; but we thought it better to set them by themselves, because their taste was bad in other points of art.

It now only remains to be observed that, as the essential parts of painting consist of many other parts, which the same masters have not equally possessed, it is reasonable to set one against another in order to make a fair judgment. Thus, for instance, Composition arises from two parts, viz., Invention and Disposition. Now a painter may possibly be capable of inventing all the objects proper to a good Composition, and yet not know how to dispose them so as to produce a good effect. Again, in design, there is taste and correctness, and a picture may have one of them only, or else both may appear jointly, but in different degrees of goodness; and, by comparing one with another, we may make a general judgment on the whole.

I am not so fond of my own sentiments as to think they will not be severely criticised, but I must give notice that, in order to criticise judiciously, one must have a perfect knowledge of all the parts of a piece of painting, and of the reasons which make the whole good, for many judge of a picture only by the part they like, and make no account of those other parts, which either they do not understand or do not relish.

We are disposed to believe that De Piles was often used by Sir Joshua Reynolds when preparing his Discourses for the

Academy. In the second discourse we find the Caracci put forward as the best examples of style, and in consequence the students were advised to allot a large portion of their time to Bologna. Now in the "Balance" the Caracci have no less than fifty-eight marks, Raphael having only seven more. Titian was the only one of the Venetians that Reynolds admired, and De Piles gave him precedence. Bassano was considered by the President to be allied to the Dutchman, and we see he has a low value in the list. There are many other examples of correspondence which could be adduced if space was available.

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

ON Monday evening the fourth ordinary meeting of the Leeds and Yorkshire Architectural Society was held, when Mr. A. W. Blomfield read a paper on "Church Architecture: Past and Present." Mr. C. R. Chorley presided, and there was a good attendance. Mr. Blomfield said of all the arts that of architecture was the most prolific; and of no branch did they hear so much said as that of church architecture. The great bulk of church-going people would tolerate none other than Mediæval architecture. The innovations that had been made on the old forms had not been on account of the changes in secular constructions. It must be clear to every intelligent person, however, that there was plenty of room for the further development of their work, and also ample scope for originality. The day had gone by when a clergyman would dare advise his congregation to warm themselves with their prayers, and not to trouble themselves about the manner in which the church was warmed. The most important thing in connection with the building of a church, as, of course, with any other edifice, was the preparation of the plan. In this the architect must give due consideration to acoustic properties, warming, and ventilating requirements, and many other necessaries. On entering churches of ancient construction a feeling of awe was more frequently experienced than in those of modern build. It was essential that this devotional feeling should be maintained, and the longer and more closely the old rules were studied the better for the success of their endeavours in that direction. Architects who made the church their special study had generally given more attention to the beautiful effects to be presented by their work than to the necessary arrangements of the interior. The lecturer remarked upon the improvements which had taken place of late years. In making a plan special attention should be devoted to the altar, which ought to be raised so as to be in full view of the congregation. In conclusion he urged his audience to apply themselves to the study of church architecture, and to produce well executed work. On the motion of Canon Scott, a vote of thanks was accorded the lecturer.

GLASGOW ARCHÆOLOGICAL SOCIETY.

THE thirtieth annual meeting of the Glasgow Archæological Society was held on the 18th inst., Professor Veitch in the chair.

Mr. W. G. Black, one of the hon. secretaries, read the annual report, which stated that 30 members had been admitted during the year, and that the total membership was 11 honorary and 252 ordinary members—in all, 263. It further recommended that Professor Lindsay should be elected president.

The report was unanimously adopted, and, on the motion of Mr. C. D. Donald, a vote of thanks was awarded to Professor Veitch, whose three years' term of office as president had now expired.

Professor Veitch, in acknowledging the compliment, said that he had never presided over a society where a better and fairer spirit was manifested. From his earliest years he had taken an interest in archæological matters, and that had enabled him to associate with many places human feeling and the human life and all its past interests, and to connect these with his present life and experience. He also remarked that during the past nine years the membership of the Society had made a great advance. In 1879 the membership was about 18, but in 1882 there were admitted 79 members, so that from 1880 might be dated the time of its prosperity. Archæology at the present time was going into the antiquarian line, and had done so most beneficially for the last twenty-five years, and especially during the last ten years. A number of books, such as the Burgh Records, had been published by various societies, and the character of these was in a great measure local history. They referred to the home and to the domestic side of the nation, and to the feelings, the faith, and the manners of the people. These books were throwing a new light on the source and the motives of history and of historical characters. He believed this was true at least in regard to Scotland. There had been such an abundance of new materials of this character that it was necessary that there should be a new historian of Scotland—at least from the time of Malcolm Canmore downwards.

M. Paul Sédille and the Architecture of the Future.

SIR,—In the excellent paper on colour by M. Sédille, of Paris, which was read at the Institute last week, the author summed up with two propositions—1st, that granite would render modern polychromy as lasting as the edifices of which it would one day be the inseparable adornment; and 2nd, that natural coloured materials must themselves form part of modern structure.

I imagine that no one will object to this, but I shall be glad to be allowed to support the proposal for other reasons than those adopted by the author. The colours of burnished granite are as beautiful as they are varied, but as a building material in London granite possesses a quality of still greater importance, viz., its wonderful and unique power of resisting the acids discharged from manufactories, and which destroy the freestones that our most important buildings are constructed with.

Since the invention of the requisite machinery for its conversion into useful forms for the builder there would be no extra cost, provided the architectural details were such as t h nature of the material suggests, and not a copy of those worked in quite another kind. Elaborate mouldings would appear to be quite unnecessary, as flat surfaces display the beauty of the material much better. Plinths, strings, archivolts, and cornices could all be worked out with large and small splays, as was done in some of the noblest edifices of past times. Modillions and dentils, if used at all, would have to be built in. Indeed, it is probable that the intelligent use of this material would be a source of economy, as the necessity for spending thousands of pounds annually upon restorations would cease utterly, for granite is imperishable, even in the noxious atmosphere of London. The prime cost of the material is not greater than that of the best freestone, and the machine works flat surfaces with astonishing rapidity. For example, a block of rough granite placed upon a moving trolley, and passed under a drum armed with steel cutters, and revolving at lightning speed, is surfaced at the rate of a square foot in ten minutes, and the burnishing (a process necessary to display the different colours) is such a simple process, that it is to a great extent done by boys.

Taking all these matters into account, no one will be much surprised that a comparative estimate shows a granite façade to cost only 3 per cent. more than one of the same size in carved and moulded freestone, which, in London, soon decays. Another advantage of the general use of granite in City architecture would be that streets which are now of dull and forbidding aspect would become bright and cheerful, for the granite is of all colours, from nearly pure white through greys, reds, and greens, to black. In conclusion I cannot, perhaps, do better than quote a general description of a complete granite building from a letter of mine in the *Times* of September 11, 1879:—"With these splendid and imperishable materials—the white or pearly grey for the burnished walls, the ornamental details of doors and windows in geometrical mosaics of the coloured varieties contrasted with intaglio work of curvilinear patterns, with figures and historical subjects designed by a Leighton occupying friezes and panels rich in colour and always clean (for being flat and burnished every shower would wash them down), and which would be excellent substitutes for the besmirched and melancholy looking statuary on the exterior of the British Museum and the Royal Exchange, a magnificent edifice, strikingly characteristic of the age, would be the result."

Your obedient servant,

Woodside, Wimbledon. HENRY TRAVIS.

NEW BUILDINGS.

Cardiff.—The Plas-Newydd Square Schoolroom or Mission Hall, Cardiff, was opened on Sunday, October 31. The building is in the Gothic style, of a plain character, and built of local stone and Yorkshire dressings. The plan consists of a large hall, accommodating about 400, a large lecture-room or classroom, and minister's vestry. At present the building will be used as a chapel, but when funds permit a large chapel will be built on the adjoining ground, which is being retained for that purpose. The cost of the building is 960*l*. The builder is Mr. David Thomas, Richmond Road, and the work has been carried out from the designs and under the supervision of Mr. J. H. Phillips, architect, Cardiff.

Kendal.—The ceremony of cutting the first sod in connection with the Victoria Jubilee Almshouses and Mission Church, Kendal, was recently performed by the Mayoress of Kendal (Mrs. Bindloss), in the presence of the Mayor and the architect, Mr. Eli Cox, when the latter presented that lady with a spade

for the occasion. The buildings are the gift of Mr. John Sleddall, formerly of Kendal, but afterwards a merchant in Liverpool, and now retired. The buildings are estimated to cost about 12,000*l.* with endowment. They are intended to be opened in the jubilee year.

SCHOOL BUILDINGS.

Balsall Heath.—The memorial-stone of Wesleyan Sunday-schools, Lime Grove, Balsall Heath, has been laid. The schools are being erected by Mr. John Bowen, builder, of Balsall Heath, from the designs and under the superintendence of Mr. William Hale, architect, of Colmore Road, Birmingham. The work generally will be of a plain character, the only ornamentation being in the front towards the road, where a little moulded and carved Penkridge stone will be used in the entrances and windows, to give more expression to the design, which is based on a late kind of Gothic. The walls generally will be of good ordinary bricks, built hollow and picked for outside works. The roof will be slated, and carried by open-timbered trussed principals, supported by cast-iron stanchions. All the floors of the schools will be of wood, those of the assembly-room and twelve of the classrooms and infants' room being laid with solid blocks on concrete. The cost of the buildings, exclusive of land, will be about 2,000*l.*

CHURCH BUILDING AND RESTORATION.

Askern, Doncaster.—A north aisle, newly-erected at St. Peter's Church, Askern, has been opened. The work has been carried out, at a cost of 600*l.*, from the designs of Mr. Fowler Jones, architect, York.

Wem.—The parish church has been reopened after alterations and renovation. The works have been executed by Mr. Henry Tommy, of Wem; the gas fittings by Mr. Shrivell, of Castle Street, Long Acre, London; the mosaic and marble work by Mr. Robert Davison, of Marylebone Road, London; the painting and decorating by Messrs. Campbell, Smith & Campbell, of Newman Street, Oxford Street; the lectern, cross, candlesticks, &c., by Messrs. Gardners, of Albert Embankment. Mr. George H. Birch, of Devereux Chambers, Temple, London, is the architect.

Ryton-on-Dunsmore.—The parish church has been reopened after restoration, which has been carried out from the designs of Mr. Ewan Christian, by Mr. Watson, of Napton.

ARCHÆOLOGY.

Mediæval Relics at Warrington.—The interesting excavations for relics of the Old Priory founded in 1379, of which all traces had been obliterated, have been continued. A chancel has now been unearthed to its entire length, which is 60 feet 6 inches, and the breadth 20 feet 3 inches. The great size of the chancel shows what an important church the Austin Friars must have had, and this is further evidenced by the wall at the east end of the chancel being found to be 4 feet 7 inches in thickness. Those at the south-west and south sides have now been bared, and each of them is 4 feet 7 inches square. The workmen are now engaged in following up this east wall. On the south side at the entrance into the chancel a doorway has been discovered, the stonework on the west side of which is of a very elaborate description. Beyond this doorway, and continuing to the south, tiles have been found in position, and it is exceedingly probable that this doorway would lead into the cloister. The fine line of pillars down the nave has not been explored beyond the first two on the north side. There is no doubt that those on the north side exist below the little lane leading to the site of the present excavations, and that the west front will be discovered at the termination of this line of pillars. The tiling in the chancel is being found in position, and it is now seen that there are several varieties of design, all of them being very beautiful.

Discovery of an Ancient Cross at Rothesay.—The shaft of what has apparently been a Celtic cross, of Iona pattern, has been unearthed recently in the churchyard of Rothesay. It consists of a rough, crooked slab of the quartzite slate found in the immediate vicinity on Barone Hill, is 5 feet 7 inches long, from 10½ to 13 inches broad, and 3½ inches thick. Nearly hidden by grass and moss, it lay unnoticed till lately. The sexton, cleaning it at the instance of the parish minister, laid bare, amid the interlaced ornamentation peculiar to Norse and Celtic monuments, the well-executed figure of a horse with its rider. When turned over, the stone displayed more elaborate sculpture, and the conjecture of the Rev. Mr. Hewison that it was a cross-shaft was fully confirmed. The obverse side had been divided into three compartments, the lowest of which is occupied by a representation of a Latin cross over a foot in length, cut like all the other figures in bold relief. This cross rests on a base, and its finials terminate in rounded bosses, and, most striking feature of all, it is surmounted by two crested birds, billing each other, which sit upon the "inviolable wood," like the eagle and its royal adversary the wren of Iranian mythology. In the second compartment a grotesquely-shaped cat seems walking with fore-legs in one direction, in another with its hind ones, which are human in form. Above this is a horse, also in the attitude of walking, mounted by a rider who either sits obliquely resting on its haunches or is in the act of falling. All the figures, though weather-worn and splintered, are distinct. The edges of the stone are much weather-worn, and are not carved. The most remarkable, if not unique, feature of the slab is the existence at its upper extremity of a tenon, indicating that the transverse part of the capital had been a separate piece fixed in a mortice-joint, so as to complete the form of an Iona cross, the lower quadrants of which had been let into carefully-bevelled sockets, still visible on both edges of the stone, at a distance of 7½ inches from the check. Unlike stones of a similar character, this is narrowest at its base, and retains the natural curve of the slate bed from which it had been split. Happily, this antique memorial is not without an eventful history. Blain, in "The History of Bute," mentions that crosses formerly stood at "Cross-Beg" and "Cross-More" (perhaps the boundaries of the sanctuary), farms near the old church dedicated to St. Brieux. Early in this century the shaft was found in a field near these farms, was preserved by the finder, and at his death was laid by his grave in the burial-place of the Mac-Alesters. The fall of a monument during a storm nipped the stone in two, but, with the consent of those patrimonially interested, the relic has been neatly repaired, and erected where last found, for preservation. Still better steps, however, ought to be taken for its safety. To its age, in the absence of lettering of any kind, there is no direct clue, although its distinctive features point to a late Celtic period. Bute was an important centre in the Celtic Church in the seventh century, having a bishop, who died in 660 A.D. The early Christian churches and cemeteries are nearly all obliterated except in name. Of the little fane and once popular graveyard of Inch Marnock—a verdant slope keeping their memory green—only a little sculptured stone remains. It is a cist-cover, having three St. Andrew's crosses, one above the other, cut in relief upon a rough slab of slate. Of the rest, a strange story, mythical-like, but true, can be told.

GENERAL.

Mr. H. Herkomer's Portrait of the Bishop of Dover will be presented on Wednesday next.

The Plaster Cast of a colossal statue of Wallace, for the Abbey Craig, Stirling, has been completed by Mr. D. W. Stevenson, R.S.A.

The Chester Sketching Club has just held its first winter meeting.

Mr. Charles Lynam read a paper on Encomb Church, Bishop Auckland, at the last meeting of the British Archæological Association.

A Winter Exhibition was opened on Thursday in last week at the Bradford Art Gallery and Museum.

Mr. Warrington Wood has been commissioned to execute a bust of the late Dr. Fraser, for Bolton town hall.

Mr. Ford Madox Brown has undertaken the production of eight cartoons of heroic dimensions to illustrate the arts, commerce, and science of this country for the Manchester Exhibition. The cartoons, painted in sanguine on a tessellated and decorated background, will fill in the spandrels of the great dome and form a keynote to the whole scheme of decoration.

The Liverpool Architectural Society has sent a petition in favour of the charter of the Royal Institute of British Architects.

A Bijou Theatre for concerts and other entertainments is to be erected at Stratford-on-Avon by Mr. Charles E. Flower.

Land for the purposes of a public park at Crewe is about to be given to the town by the London and North-Western Railway Company.

The Saxon Chapel, at Deerhurst, has been completely repaired. An inscribed stone found in use as a window head has been let into the wall in a position of safety.

A Railway Viaduct was opened last week near Dalbeattie, over the Urr. The weight of metal employed is 7,000 tons; masonry, 7,000 tons; concrete, 500 tons—total, 14,500 tons. The cost has been about 15,000*l.*

The Report of the Glasgow Sanitary Protection Association states that during the past year 131 houses had been examined for the first time, and of these 104, or 80 per cent., were found seriously defective. The defects were of the usual character. Fifteen of the houses were fresh from the builder's hands.

The Architect.

THE WEEK.

HER MAJESTY has lent three pictures to the Royal Academy for the forthcoming Winter Exhibition of Old Masters and Deceased Artists of the British School. They are :—WILKIE'S *The First Council*, and LESLIE'S *The Administration of the Holy Communion to the Queen at her Coronation*, and *The Baptism of the Princess Royal*. They were painted to command, and as they relate to events in the early part of the present reign they will be appropriate. Two of them are well known from engravings. The exhibition will also be enriched by fifty-two pictures from the Dorchester House collection.

THE French Council of State have considered the subject of the donation of Chantilly. As was anticipated, the property has been accepted. But it was found to be necessary to comply with a condition which was overlooked hitherto. According to the Civil Code no donation of property is legal unless there is a deed signed by the giver and receiver or their representatives, and which is to contain an exact description of the property. The Council have therefore accepted the gift of the Duc D'AUMALE provisionally, and has applied for a complete inventory of the furniture, pictures, books, bijouterie, and other contents of the château. When this document is ready the proposal will be again submitted, and, unless some unexpected event intervenes, formally accepted.

AT the meeting of the Manchester Architectural Society, which was held on Wednesday, a paper was read by Mr. DAVIES-COLLEY in which the prospect of obtaining a really representative collection of the fine arts at the forthcoming Jubilee Exhibition, which would adequately set forth the progress of the last half century, was examined. It was suggested that two or three sub-committees of representative professional men should be at once appointed to assist the executive. In this way a more thorough and systematic scheme was likely to be adopted, and in architecture a collection of the most typical and artistic buildings would be secured. The meeting approved of the suggestion.

PROVINCIAL schools of art are rarely self-supporting, and in consequence the masters and officials have an anxious time whenever accounts are balanced. The Leamington school could not hold out any longer, and the doors are now closed. Although the town is supposed to be a fashionable resort the residents do not seem to care for art. It is considered by some that the Free Libraries Act is applicable to the support of museums and art schools, but while 525*l.* a year was spent on the library the school of art was allowed no more than one-twentieth of that sum, or 25*l.* The closing of the school is not creditable to the town and may affect its interests in many ways. Efforts are, accordingly, being made to obtain support. It is said that by a moderate amount of aid, that is, a guarantee of 75*l.* a year, another trial of the school of art could be attempted. So much has been revealed lately about the uncertainty of local support that the authorities will have to face the difficulty.

AN extraordinary general meeting of the Glasgow Institute of Architects was held on Tuesday, with Mr. D. THOMSON as chairman, for the purpose of giving effect to the following rules, recommended by the Council, who had had "recent competitions" under consideration :—1. That in a competition where the cost is specified a competitor is not entitled to submit a design which he knows could not be carried out in all respects as shown for the stipulated sum. 2. That in a competition so restricted a professional assessor is bound to set aside every design which he is satisfied would exceed the stipulated sum by more than ten per cent. 3. That in all competitions where a professional assessor is employed his report should be shown to the competitors. It appeared that a letter had been received from Mr. JOHN BURNET, who raised the question whether the passing of the proposed rules was for the advancement and the interests of the profession. Mr. JOHN HONEYMAN moved, in terms of the recommendation, that the Institute approve of the rules. These rules, he remarked, imposed no new restriction upon competitors, they simply declared that competitors must abide by conditions which they had voluntarily agreed to come under. Mr. SELLARS seconded. It was moved by Mr. BAIRD, as an amendment, that the time was inopportune for the Institute to interfere in the matter. This was seconded by Mr. HALKET. Some discussion followed. It was suggested that Mr. BURNET'S letter should be read, but the meeting was decidedly averse to this, as it was thought the writer had viewed the proposals of Council from a personal point of view. It was ultimately agreed that, in view of Mr. BURNET'S letter, the meeting be adjourned and the whole matter be again considered by the Council.

AN effort was made to excite curiosity about the mysterious cupboard in Sir JOHN SOANE'S house, Lincoln's Inn Fields, but it did not succeed. He was not the sort of man to conceal a skeleton; on the contrary, he was rather disposed to proclaim his professional and family troubles to the world. However, on Monday the trustees, consisting of Mr. WATERHOUSE, R.A., Mr. GODWIN, F.R.S., Mr. C. S. PERCIVAL, F.R.S.A., Professor T. HAYTER LEWIS, F.S.A., Professor FLOWER, F.R.S., Dr. FRESHFIELD, V.P.S.A., Dr. RICHARDSON, F.R.S., and Alderman Sir R. W. CARDEN, together with the curator (Mr. WILD), and the solicitor to the trustees (Mr. UPTON), formally opened the cupboard in the Museum. They were confronted by a document dated December 6, 1837, which stated that the repository was opened in order to see if it contained anything which could be mulcted in probate duty. The papers which were then left were found in the drawers on Monday, but apparently they merely relate to some of Sir JOAN SOANE'S works, and to the dispute with his son. Sir JOHN died on January 20, 1837, and it is remarkable that a few days before his death he amused himself with the preparation of a design for a pedestal for the statue of WELLINGTON, a project which is again under consideration.

WITH all his foibles Sir JOHN SOANE was generous with his money. He was Superintendent of Works to the fraternity of Freemasons, and when the hall adjoining Freemasons' Tavern was proposed he subscribed 500*l.* towards the cost. He also gave 1,000*l.* to the committee who had undertaken the erection of the York column. He presented 750*l.* to the Institute of Architects, and 250*l.* to the Architectural Society. His gift of the house and contents in Lincoln's Inn Fields was valued at 60,000*l.* A little time before his death he paid 500*l.* for a collection of drawings belonging to GEORGE DANCE, R.A., in whose office SOANE assisted. A clerk of works who was employed under him at the Bank of England enjoyed a pension of 150*l.* from Sir JOHN, and he made a provision that it was to be continued during the man's life. To another man at Chelsea Hospital he left 50*l.* a year. His assistant, Mr. GEORGE BAILEY, was provided for by being made the first curator of the museum, and Mr. RICHARDSON, who was also an assistant, received a bountiful legacy. With proofs of this kind on record it was absurd to imagine that Sir JOHN SOANE could leave money concealed in a cupboard.

THE annual general meeting of the Society of Antiquaries of Scotland was held on Tuesday. It was stated that the Society had lost twenty members by death during the past year, and that thirty-five new members had been added during the same period, the total number of Fellows being 674. The annual report of the museum indicated an increase of 19,195 visitors over last year, the total number for the year just ended being 103,193. The number of donations to the museum and library during the year had been 171, and 2,747 specimens had been added to the museum by purchase. The Marquis of LOTHIAN was elected president, and three painters, viz., Sir WILLIAM FETTES DOUGLAS, Sir J. NOEL PATON, and Mr. R. HARDMAN are on the Council, but, as is usual, there is no architect.

THE CONSULTING ARCHITECT.*

IT is less easy to discover a title for a book than to write several pages, and we can see an illustration of the difficulty in Professor KERR's latest volume. What is meant by a "consulting architect"? Reasoning from the practice in engineering and medicine, we might suppose him to be an architect-specialist, who, on a formal application, was prepared to give advice to his brother practitioners. Thus the late Mr. E. W. GODWIN described himself as the "consulting architect" for one town hall, and we find him inquiring whether his friend Mr. BURGES did not hold a similar office in respect of another building of that class. In such a case the consultation would relate to design and archæology. An architect who advised on planning or construction would also be justly entitled to be considered a consulting architect. Now Professor KERR's book can only be said to treat indirectly of the art or science of building, and it can hardly be called a guide to the duties of a specialist. It is simply a treatise on the legal procedure in which the majority of architects are likely to take a part, and the consultation means giving information to a client or his solicitor rather than to another architect. The book can therefore serve a more general use than is to be inferred from its title. It will not enable a young architect to be an expert, and it will not, like the readable "Country Banker," become a revelation to the public of the position of an influential class of men; but as an adviser in what may be called architectural jurisprudence, Professor KERR's book will be found invaluable to the novice, and there is much in it to recommend the pages to men of a different class. There are already books by lawyers on the law of building, but they do not treat the subject as if seen from the architect's point of view. Professor KERR does this, and his experience in courts both as a witness and a litigant gives him a claim to be recognised whenever he stands forth as an authority on that branch of practice.

It is, moreover, a safe book, for it is not written in a litigious spirit. Every one who has had much to do in courts must have observed that there are certain judges, who, soon after cases are opened, send down bits of folded paper to counsel, which are recommendations of compromise. Their lordships' interference may be inspired by consideration for the parties to the action, or by a feeling of weariness, since, after a time, legal contests lose much of their excitement for onlookers. Professor KERR ought by this time to be *blasé* with light and air cases and proceedings in the police court, and this probably explains why so much is made in his book of the virtues of compromise. Combativeness and bumptiousness have at times their uses, and in London architects are to be found who try to gain a reputation for having the qualities, as a fighting witness is supposed to be indispensable in some cases; but men of that class are not in general request, and a client who employs them in law courts would hesitate about entrusting a building to their hands. A solicitor who tries to settle a cause out of court is regarded as a treasure, and he never loses by his apparent self-sacrifice. The same rule applies to an architect, and Professor KERR acts wisely in recommending his readers to become peacemakers, if it were only on the ground of expediency, for, as is suggested by the lawyer's maxim, "a good settlement is better than a good fight."

His book has a dozen sections, viz, Construction and Evidence, Arbitration Cases, Structural Damage, Easements, Ancient Lights, Support, Sanitary Cases, Leaseholds, Valuations, Building (Contracts, Supervision, &c.), Metropolitan Building Act, Architects' Disputes and Etiquette, or in other words it discourses upon the relations of an architect to clients, contractors, and fellow architects.

In treating of the varieties of the relations, Professor KERR never supposes that the architect is to become a partisan. The architect, he says, is not the servant of his client, but in a sense his master, and it is his office to insist that justice is done to all. This spirit inspires the pages. A lofty view is taken of professional duties, and, whether acting as arbitrator or as witness, the same desire to see justice prevail is supposed to be alike influential. A lawyer might not endorse all that is written to attain that end. For example, when the architect is advised about the risk of causing a practical wrong when insuring a legal right, and when it is said to be "never fair to ask him to accept as his function the legal enforcement of hardship against his own practical and professional sense of equity," we have the germ of a doctrine that would overtop statute law, and, if it prevailed, a lawyer would hardly know where he stood, or how to deal with a building case.

But, while eager for the dignity of his profession, the author does not uphold the sufficiency of factitious arrangements which are occasionally accepted. Thus, we find him arguing that the practice by which the taking out of the quantities is assigned to a surveyor is not always advantageous, since a client may with reason object that "the financial part of his business, the most important of all, is handed over to he knows not whom, to do what he pleases with it out of sight." In a country like England, where everything turns on money, it is not surprising that the surveyor is becoming recognised as belonging to the more practical species of architects, and that unless in exceptional cases it is considered a prudent act to deal directly with him, and allow him to have charge of the whole work of a building. Professor KERR advocates the taking out of quantities in the architect's office, under his personal control, and, where convenient, with his personal participation. Everybody knows of course that there are numerous architects who will not participate unless under compulsion, for they find the work is not congenial with designing. We refer to this subject in order to suggest that the contents of the book touch everyday practice, for, as legal actions often are the consequences of quantities that are unsatisfactory to somebody, it is only right to consider the various ways in which they are obtainable.

The book is, however, mainly intended to prepare the reader for being a witness. He will do well, therefore, to bear in mind what is said in the first page about opinions being well grounded "on sound principles as well as ample experience." Indeed, witnesses are most often staggered in courts when suddenly confronted with a scientific principle. A case occurred not long ago where a building surveyor, who brought an action to recover damages for a serious injury in a railway accident, was confounded when one of the jury displayed a little scientific knowledge, and asked a question which was an application of the laws of gravitation. The surveyor was unable to explain, and lost his case, for, as he was an expert, it was inferred that he could answer but dare not. As long as a witness is allowed to testify to what he saw he may be thought to be safe from principles; but the cases are few in which a man can escape so easily. A barrister may not know much of the details of a building case, but his client's interest may be served equally well if he is able to embarrass a witness, and this can be done either by applying some principle that seems contradictory, or by making the witness demonstrate that he is not omniscient. We are disposed to agree with Professor KERR when he says that most building cases are decided on false issues when tried in the ordinary way, and as much may be said of most technical cases. But it must be remembered that THEMIS will always have her own way of weighing things.

It is surprising that we have not imitated our French neighbours, and set up a tribunal of experts in order to escape false issues, if that be advantageous. The action of the Railway Commissioners suggests the utility of the arrangement, for owing to the experience acquired by the members cases are now settled more satisfactorily and at less cost than formerly. It is true arbitration is becoming more general, but there is no body of arbitrators as in France, and experience is as much needed in this class of work as in any other. If it be objected that arbitration is costly and tedious, the allegation cannot be denied. Professor KERR says that "an experienced architect-arbitrator ought always to be allowed to discourage the prolongation of the inquiry by unscrupulous tactics," but it ought not to be a case of allowing. If the arbitrator felt he had the support of a body of men like himself, he need not recognise the "law's delay," and could make short work of the inquiry. As it is, judges, out of mercy to the parties, often decline to

* *The Consulting Architect: Practical Notes on Administrative Difficulties and Disputes.* By Robert Kerr, F.R.I.B.A. (John Murray.)

send building cases to arbitration. "A man of harmless antecedents," to use Professor KERR's phrase, may be potent in affording opportunities to run up enormous bills of costs. The objection to arbitration which exists in the legal mind arises from the absence of all assurance that an architect who is called upon to preside has mastered the conditions of evidence. There is nothing to show that the subject has been comprised specifically in the training of the profession; and although business may impart a power of the kind a lawyer is not to be supposed to take that for granted. A revelation is given of the shortcomings of proceedings before an architect, when we read in the book that a legal referee attends patiently to all that is said, however elementary it may be, while "an architect is too apt to remind an anxious advocate of his own profession that it is unnecessary to waste rhetoric upon a tribunal so perfectly informed." That mode of hearing a case, if described in a court, would be enough to overcome the gravity of the Bench, for it suggests that the elements of legal procedure are unknown. Professor KERR says that an architect-arbitrator "ought certainly not to play the lawyer." That is right enough in one sense, but the arbitrator ought not only to play the lawyer but play him as closely as his imitative powers will allow whenever he is dealing single-handed with evidence. Both in its reception and its sifting there is much to be taught by the practice of the courts.

From Professor KERR's experience there is especial interest in the chapters on Ancient Lights and the London Building Act, which are the longest in the book. Cases relating to the former are among the most difficult that enter the courts. They are supposed to relate to facts of which evidence might be always forthcoming of a conclusive sort, but the power of a witness's vision seems to be determined by the side on which he appears. If a man says that he was able to read a badly-printed newspaper in the parlour of a public-house before the neighbouring premises were raised, while afterwards that enjoyment was denied him, who can say he is wrong unless a witness who has observed him afterwards luxuriating with small print? A judge naturally hesitates to conclude that such a reader is untruthful. The late Vice-Chancellor MALINS, who was disposed to let his face express the action of his mind, generally held an opposite theory, for in light and air cases he used to look as if counsel and witnesses on both sides were only trying how they could bewilder him, which was never an impossible undertaking. His Lordship was, therefore, fond of examining the premises himself, which is a course of action that is not always to be recommended, owing to the variations in the impeding power of the London atmosphere to the sun's rays. Light and air cases are generally complicated by the animosity of at least one of the litigants, and as long as such a state of things continues the aid of courts will be invoked, and architects will have to share in the fray; but where it is simply an affair of buying and selling a privilege, Professor KERR is right in saying, "The best advice that can be given to men of business and others who have a reputation to lose, and neither time nor temper to waste upon foolish and reckless contention, is to put themselves in the hands of an experienced expert." The chapter on the Building Act, if read with attention, will have the effect of removing a good many of the prejudices by which district surveyors are surrounded.

The chapter on "Architects' Disputes and Etiquette" contains much to excite reflection, and of a sorrowful kind. There is no body of men in England with less coherence or solidarity than architects, and no body to whom the poet's "heap of uncementing sand" is more applicable. The truth of Professor KERR's statements cannot be denied in any case where an architects' dispute is brought into court. It is too well known that "architects of prominent position will consent to be retained as insidious advocates to defeat and degrade their colleague," and "there are men of what is called the highest standing who will accept a retainer of this kind cheerfully in any case that comes to hand." It is manifest that Professor KERR does not write from hearsay on the subject. It is, moreover, a historic fact that so deplorable a condition of affairs has originated since the Institute was set up. The founders were so sanguine it would promote "mutual good understanding," that they did nothing to bring about that sort of millenium, and one of the Presidents was forced to confess that "mutual scorn" was the true attribute of the profession. Professor KERR is over credulous in his belief in the Institute, but in spite of himself he has to testify that not even the schedule of professional charges is treated with respect. "This has been in force for twenty-five years," he says, "under the very seal of the Institute, and yet there have been gentlemen of position in the Institute who could permit themselves to be retained, against the personal claims of other members, in a court of law to explain away its provisions with all the license of advocates at the bar." When this is the manner of acting of the gentlemen of position, what is to be expected from the rank and file?

A chapter on etiquette is essential to a book of the kind, for when architects do not meet in a spirit of mutual goodwill their consultations are not likely to end in a compromise that will be advantageous to clients. The relations between architects are not, however, confined to law cases, and what is written by Professor KERR will have its use in many circumstances connected with practice. As we have said before, he takes a rational view of life, and does not suppose that an architect is an exalted being who can evade the collisions that are inevitable to the majority of ADAM's sons.

AMATEUR PHOTOGRAPHY.

AT last week's meeting of the Dublin Sketching Club Mr. J. L. Robinson, architect, read a paper, which was illustrated by several of his photographic transparencies. Mr. Robinson said that although what he was to say had been called a lecture, he wished to impress upon them that it was not a lecture, but a description of a series of photographs taken by himself on his holiday last August in England and France. He asked his audience to extend their indulgence to any defects in the transparencies, as he was but an amateur photographer. He went on to say that Dr. Frazer in his lectures laid great stress on the advantage which photography gives to the lovers of good etchings by the marvellous reproduction of the greatest engravings of priceless value. He trusted that the views which he was about to show them would prove that, although photography was described by some as being purely mechanical and destructive of all true art, it was of the greatest advantage to the painter and student, and that by the selection of the points of view and judgment of light and shade, good work can be done by the photographer, and the painter may secure passing effects such as clouds, waves, light, &c., which could not otherwise be obtained, and would prove of the greatest assistance to him when converting his sketches into easel pictures. He said that for the past six years he had taken part in the annual excursion of the Architectural Association, a professional body numbering about 1,000, which had its headquarters in London. The excursionists numbered usually from thirty-six to forty, and spent a week together each year. He then described the arrangements made for the week. Their headquarters this year was Town Malling, in Kent, between Tunbridge and Maidstone, the centre of the hop country, and may truly be called the garden of England. On the first day of the excursion the weather was very bad—raining heavily—consequently very little work was done. Each of the following places mentioned were well shown on a large sheet by means of a very powerful lantern, which lent a great deal to Mr. Robinson's description of the various places. The first place visited was Malling Abbey, the remains of a Benedictine convent, founded by Bishop Gundulph, of Rochester, in 1090. Portion of the west end remains, showing remarkably similar features to that of the Norman portion of Rochester Cathedral. The abbey is used as a dwelling-house, but the church is in ruins. The gatehouse is very interesting, being now used as an orphanage by the Anglican nuns. A drive along the Medway, with numbers of factories on either side, brought them to Rochester Castle, Norman in style, but of no particular architectural features. Close to the castle stands the cathedral, another uninteresting pile of building. The rain here was so great that photography and sketching had to be abandoned. In consequence of having sheltered from the rain he missed seeing some very picturesque old houses in this place. Rochester is famous for having been visited by Mr. Pickwick and his club. Leaving Rochester, they went on to Cobham, the seat of Earl Darnley, and as the rain had ceased he was able to make very interesting photographs, which he exhibited. Cobham is a large mansion of the Elizabethan style, dated 1662, of little architectural interest. Thence he went to Maidstone, and exhibited numerous photographs taken, the principal ones being Maidstone Church, tomb of John Wooton, Aylesford Mansion, bridge, &c. He then proceeded to enumerate the different places visited during

the excursion. Mr. Robinson afterwards visited France, and took some very fine photographs of French cathedrals, including Amiens, Abbeville, and Beauvais. The hall was densely crowded.

TESSERÆ.

Planning Theatres.

W. TAYLOR.

NO modern theatre can be required to hold above 2,500 people. Perhaps a very cheap place of amusement, with unusually large gallery and pit, may require room for 3,000—lucky is the director who can fill it for any length of time. If you can build so large a house as this, no shape is as good as that of Her Majesty's, viz., the half circle continued with straight sides very slightly contracted as they near the stage, the tiers one exactly beneath the other, no one projecting beyond the other. At Drury Lane the tiers are unusually deep, from one house having been built inside the other, but this is not so good for sound. If it is a small house, an adaptation of the balcon principle must be adhered to in order to get sufficient places. One of the best studies of this sort of house is that at Mayence, given in Fergusson's "Handbook of Architecture." The round corners at the stage end of the balcon at the Adelphi are very unsightly in shape; they should come sharp away from the side. As to sound all the elaborate theories have failed to produce a perfect house. The very best theatre in the world for sound is Her Majesty's, which was certainly built without any such scientific principles. But I will explain how it is that you do hear so well in that theatre. The shape of it is like a drum, and the wall of the auditorium is flat. The brick wall ought always to be at the back of the boxes, although for safety against fire you require another wall at the back of the lobby. If the wall at the back of the boxes be only of canvas or plastered you cannot expect good acoustics; hangings, curtains, papers are all against good sound. At Her Majesty's there are no projecting ornaments of any kind—the outside of the boxes is flat and even. This is a great secret in theatrical decoration; all ornament in relief is fatal to sound, it stops its progress and true course. The pit tier fits tight on to the floor; there is no walk underneath the lower tier at the back of the pit, as is very common in small houses; and, finally, the crowning effect of all is the ceiling: it is perfectly smooth and even, without any ornamentation in relief, and in form is a slight dome; it fits on to the top of the house like the top of a violin—in fact, a theatre ought to be a sort of a violin, with the audience sitting inside it. The top of the house ought to follow the shape of the lower part exactly. Never was there such an egregious mistake as building a square top to a theatre that is round below, as at Covent Garden. The ceiling must fit on like the top of a pomatum pot, right away from just above the proscenium, which should flow with a smooth continuous curve into it. Architectural pillars and other excrescences by the stage boxes I look upon as perfect abominations; they are hideous, and spoil sound. Nothing is so beautiful as the smooth run of the boxes straight up to the proscenium frame, and nothing is so excellent for sound.

Ostentation of Gothic Architecture.

J. FERGUSSON.

The Gothic architects went even beyond the Romans in this respect. They prided themselves on their constructive skill, and paraded it on all occasions, and often to an extent very destructive of true architectural design. The lower storey of a French cathedral is generally very satisfactory; the walls are thick and solid, and the buttresses, when not choked up with chapels, just sufficient for shadow and relief; but the architects of that country were seized with a mania for clerestories of gigantic height, and which should appear internally mere walls of painted glass divided by mullions. This could only be effected either by encumbering the floor of the church with piers of inconvenient thickness or by a system of buttressing outside. The latter was the expedient adopted; but notwithstanding the ingenuity with which it was carried out, and the elegance of many of the forms and ornaments used, it was singularly destructive of true architectural effect. It not only produces confusion of outline and a total want of repose, but it is eminently suggestive of weakness, and one cannot help feeling that if one of these props were removed, the whole would tumble down like a house of cards. This was hardly ever the case in England; the less ambitious dimensions employed in this country enabled the architects to dispense in a great measure with these adjuncts, and when flying buttresses are used, they look more as if employed to suggest the idea of perfect security than as necessary to stability. Owing to this cause the French never were able to construct a satisfactory vault in consequence of the weakness of their supports; they were forced to stilt, twist, and dome their vaults to a most unpleasing extent, and to attend to constructive instead of artistic necessities. With the English architects this never was the case; they always were able to design their vaults in such forms as they thought would be most beautiful artistically, and, owing to the greater solidity of their supports, to carry them out as designed. It was left for the Germans to carry this system to its acme of absurdity. Half the merit of the old round-arched Gothic cathedrals on the Rhine consists in their solidity and the repose they display in every part. Their walls and other essential constructions are always in themselves sufficient to support the roofs and vaults, and no constructive contrivance is seen anywhere; but when the Germans adopted the Pointed style, their builders—they cannot be called architects—seemed to think that the whole art consisted in supporting the widest possible vaults on the thinnest possible pillars, and in constructing the tallest windows with the most attenuated mullions. The consequence is, that though their constructive skill still excites the wonder of the mason or engineer, the artist or the architect turns from the cold vaults and lean piers of their later cathedrals with a painful feeling of unsatisfied expectation, and wonders how such dimensions and such details should produce so utterly unsatisfactory a result.

A French Sixteenth-Century House.

ARSÈNE HOUSSAYE.

If you would glance with me at the curious childhood of Callot, rebuild, by the aid of your historical associations, at Nancy, near the old Hôtel de Marque, a somewhat lofty house-front, its doors and windows ornamented with carvings, rusted by the rain and corroded by the moonbeams. Between the two windows on the ground floor is a stone bench for beggars and pilgrims; on the first floor are two casements—that is to say, stone crosses, each forming four openings; on the second floor two attic windows open in the roof above the gutter—they are surrounded by moss, a few tufts of grass, a stray flower sown by the wind or by a bird; on the summit of the roof is one tall chimney which continually smokes. On entering this house we find it furnished in a severe style, in harmony with the pale light that penetrates through the little lozenge-shaped panes; walnut-tree presses, a desk for prayer, an ebony crucifix surmounted by consecrated garlands, amongst which the spider has never time to spin his web; settees in carved oak, Gothic tables with twisted feet, a vast chimney over which hangs an ornamental mirror; upon the mantelshelf silver goblets, handsome in form and ample in contents, chiselled in a century when men knew how to drink; between the two casements a Gothic clock, on the shelves of the press a brilliant display of pewter vessels, earthen pots embellished with wreaths, and a beautiful cup of Bohemian glass. At the first glance we perceive Jean Callot, in velvet breeches all puffed and slashed, walking up and down deep in thought; or Renée Brunehault, seated at the chimney corner and busy with her distaff. In such a house as this was Callot born in 1592.

Indian Houses.

J. G. MEDLEY.

Some specialities of construction which are common to most Indian buildings attract the attention of the new-comer. Except in the presidency towns, they have no upper storey, partly from considerations of expense and partly because the upper rooms get very hot during the dry months. The roofs are either thatched or tiled, or else are flat and covered with brick and lime plaster. The thick beams supporting the roof are, as a rule, left exposed below, as ceiling cloths are apt to harbour vermin and conceal the depredations of white ants. The room walls are very rarely papered, being usually plastered and whitewashed. Wooden floors would be too perishable and dear, so floors of flat tiles or of lime plaster are substituted. Doors are numerous, and invariably double, opening in the middle. Verandahs all round a house are considered indispensable.

Sinking Wells.

B. LATHAM.

In sinking ordinary wells in loose strata, an excavation is made to such a depth as the strata will admit without falling in. A wooden curb is then placed in the bottom of the excavation, and the brick steining laid upon it, and when carried up to the surface, the work of the excavation is carried on; but the way in which it is now proceeded with depends upon the method adopted in extending the steining. If the steining is intended to be added below the curb, the earth is excavated flush with the interior sides of the well, so that the earth underneath the curb supports the brickwork above. When the excavation has been carried on as far as convenient, recesses are made in the earth under the previous steining, and in these recesses the steining is carried up to the previous work. When thus supported, the intermediate portion of earth between the portions of brickwork carried up are cut away, and the steining completed. By a succession of operations of this kind the well is

sunk, and the steining carried to the required depth. On the other hand, if the steining is added from above, the curbs are supported by iron rods, fitted with screws and nuts from cross timbers over the mouth of the well, and as the excavation is carried on below, brickwork is piled on above, and the weight of the steining will carry it down as the excavation proceeds, until the friction of the sides overpowers the gravitating force or weight of the steining, when it becomes, as it is technically called, earth-bound; then a set-off must be made in the well, and the same operation repeated as often as the steining becomes earth-bound, or recourse must be had to the first method of underpinning. Brick steining is executed either in bricks laid dry, or in cement; when the work is laid dry, a ring or two of brickwork in cement is often introduced at intervals varying from 5 feet to 12 feet apart, to strengthen the work and facilitate the construction of the well. The bricks are laid flat, breaking joint; and, to keep out moderate land springs, clay, puddle, or concrete is often introduced at the back of the steining. For most purposes concrete is the best, as in addition to its impervious character, it adds greatly to the strength of the steining. The same measures used in sinking brick steining are adopted with iron.

Polychromy of Exteriors.

F. P. COCKERELL.

If we accept the lesson which Nature teaches us, as we find the Greeks did in her geographical distribution of colour, we shall find that the exterior decoration of the ancients affects us very little. The brilliant colours which produce so good an effect in a southern climate would be staring and crude under our grey and clouded skies. Any colour, therefore, which we apply to our buildings externally must necessarily be of a very subdued kind—a combination of half-tones; and how can we hope to produce such harmonies as Nature will establish for us by a few years of exposure? There is another very important consideration in comparing the works of the Greeks with our own, namely, the difference of scale. The Greek temples were the merest toys compared with our great modern buildings. This does not prevent our using colour in some small objects, and in parts close to the eye, as in shop fronts, &c. But the taste for exterior polychromy has been in a great measure rejected in the best times of northern art, indeed, so far that a large use of varied coloured materials is comparatively exceptional. The combinations of brick and stone and the occasional introductions in stone buildings of coloured marbles of small quantities have been canonised by the approbation of centuries, and their good effect cannot be denied. The insufficiency of paint in our northern climate is sufficiently shown in some of the buildings in the Champs Elysées, Paris, as the Cirque Impérial and several café restaurants which, with all their pomp of Classical orders, &c., are reduced by their trumpery paintings to the appearance of buildings in a fair. Our climate is not bright enough to give value and brilliancy to paint. If we use colour, therefore, it must be of such material as having an intrinsic value shall supply to the mind that interest which the eye does not feel. Finally, if the foregoing observations should seem to be directed exclusively to the buildings in the country, and which are to harmonise and enter into combination with the objects of Nature, it will be found by carrying out the principle which I have endeavoured to establish that, if strong colour cannot be brought to harmonise with our landscape, sky, &c., *à plus forte raison*, it will appear crude and inharmonious amid the greys of London.

Aspect of Houses.

H. REPTON.

I consider the aspect of infinitely more consequence to the comfort and enjoyment of the inhabitant than any prospect whatever; and every common observer must be convinced that in this climate a southern aspect is most desirable; but few are aware of the total difference in the effect of turning the front of the house a few points to the east or to west of the south; because, although the south-east is the best, yet the south-west is the worst of all possible aspects, for this reason, viz., all blustering winds and driving rains come from the south-west, and consequently the windows are so covered with wet as to render the landscape hardly visible. At Organ Hall, in Hertfordshire, the living room was towards the south-west, and during a heavy storm of wind and rain we accidentally went into the butler's pantry, which looked towards the south-east, where we found the storm abated and the view from the windows perfectly clear and free from wet; but on returning into the other room the storm appeared as violent as ever, and the windows were entirely covered with drops, which obstructed all view. On considering the prevalence of south-west winds it was determined to reverse the aspects of the house by changing the uses of the room, making a very comfortable house of one which, from its aspect only, was before hardly habitable; since no window, nor hardly any brick walls, will keep out the wet where a front is exposed to the south-west. For this reason, it has been found necessary in many places, as at Brighton, &c., to cover the walls with slates or pendent tiles, and to use double sashes to the windows so situated. If we had only one front or one aspect to consider our difficulty would soon vanish; but the prevailing partiality for variety of prospect seems to require that in every direction the views should be retained; and as the opposite walls of the house must be parallel, and the corners at right angles, we must consider the effect on each of the four sides. First, the aspect due north is apt to be gloomy, because no sunshine ever cheers a room so placed. Secondly, the aspect due east is not much better, because there the sun only shines while we are in bed. Thirdly, the aspect due west is intolerable, from the excess of sun dazzling the eye through the greatest part of the day. From hence we may conclude that a square house, placed with its fronts duly opposite to the cardinal points, will have one good and three bad aspects. Let us now consider the effect of turning the principal front towards the south-east, then the opposite front will be to the north-west, an aspect far better than either due north or due west, because some sunshine may be preserved when its beams are less potent than in the west, and the scene will be illuminated by those catching lights so much studied by painters. An aspect open to the north-east would be objectionable during the cold winds of spring.

The Ecole des Beaux-Arts, Paris.

H. L. DE BOISBAUDRAN.

Young men who take part in competitions direct all their efforts, as is but natural, to obtain the prizes which follow success. Unhappily, the means which usually commends itself to them as being both the surest and easiest is the imitation of works which have previously obtained the approval of the judges, and have been shown with honour and *éclat*, as if with the intention to afford examples, and to point out to younger men the straight road to similar success. Do people realise the whole effect of such a stimulus, when they see the majority of the competitors abandon their individual inspirations, to follow with complete docility the recommendations of the Ecole des Beaux-Arts, which seem sanctified by success? With but very rare exceptions, mere admission to the competition cells is only achieved after long periods of study exclusively directed to the one purpose, and it is the long duration of this unnatural preparation which makes it so fatal to the freshness of original gifts. Pupils delayed in this way end by resembling those aspiring baccalaureates whose aim is rather a diploma than the acquisition of knowledge. Two tests are demanded before admission to a cell is allowed, a sketch or composition of any given subject, and a painted figure from a model. Preparation for this double test becomes the one idea of young artists. Their only studies are the daily repetition of these sketches and commonplace figures, always executed in dimensions, within a limit of time, and in a style identical with those required for the competition itself. After whole years devoted to such practice, what can remain of the more precious qualities? What becomes of *naïveté*, sincerity, naturalness? The exhibitions of the Ecole des Beaux-Arts tell us only too clearly. At times certain competitors imitate the style of their respective masters, or that of some famous artist. Some seek inspiration from the works of former laureates, others borrow from recent successes at the Salon, or from other works which may have left lively impressions upon them. All these various influences may give a certain diversity to a few of the exhibitions, but they do not give anything like natural variety, or the original character flowing from individual inspiration.

English and Continental Gothic.

R. WILLIS.

Foliation, as a regular practice, appears to come from Germany, where early traces of it may be found in the Rhenish churches; but I am by no means sure that the Pisans may not have a claim to it. Tracery is probably due to the Germans or French. Its value as a national characteristic has been sufficiently spoken of elsewhere. With respect to the regular styles of the Gothic, England may claim the honour of inventing the Early English, the germs of which, however, are to be found in France; and I conceive the Decorated or Complete Gothic to be derived from Germany; from which country emanating, it superseded all the established styles in other countries except Italy. The Perpendicular is our own, and heartily may we congratulate ourselves upon it, when we compare it with its sister styles in France and Germany. The prevailing vice of these two styles is the excessive use of interpenetration amongst the mouldings; no moulding is allowed to stop or rest firmly upon a surface, but must always appear to pierce it, and, if possible, to make its appearance on the other side. The Germans and French have two different modes even of using this method, so destructive of all apparent stability, and of which some insignificant traces may be found in our own country.

NOTES AND COMMENTS.

IT must be confessed that the project of the Edinburgh Municipal Buildings is not found to be as satisfactory as was anticipated. There is no doubt that many members of the Town Council are opposed to the proposed building. On Tuesday there was a meeting of the Council, when an attempt was made to set aside the project, and, although defeated by sixteen votes, still that is no great majority. Notice was also given that at the next meeting it would be proposed "That no Bill relating to the proposed Municipal Buildings be deposited or promoted during the ensuing session of Parliament." We suppose that proposition will also meet with defeat; but, when there is so much wrangling over a project, a competitor is likely to lose heart, and even give up the attempt. In at least one case a competitor has applied for the three guineas he deposited, and the money was returned to him.

THE works at the great church of Montmartre continue to be carried out as expeditiously as means allow. The rate at which subscriptions arrive will be judged from the receipts for October, which amounted to 99,413 frs., or not quite 4,000*l.* Up to the end of that month the total receipts have been 17,569,736 frs., or, say, 700,000*l.* The total expenses have been 16,945,301 frs., leaving a balance in the treasury of 624,435 frs., or about 25,000*l.*

THERE was a good deal of bustle in the streets of the City on Thursday morning when it was known that the church of St. Mary Magdalen in Knightrider Street was on fire. The street is very narrow, and it was difficult for the firemen to work. As soon as the flames caught the roof of the church it became evident there was no hope for that part of the structure, and it collapsed in a short time. The walls are safe, but the church may be said to be ruined. The ease with which the destruction was accomplished must excite apprehension about the safety of some others of the City churches.

ONE of the oldest structures in the town of Vannes is that known as the Porte-Prison. It was built in the fourteenth century by Duc JEAN IV., who was a benefactor to the town, and consists of two towers, of which the townsfolk were proud. The decree for the demolition of the ancient gate has gone forth, and there is in consequence much indignation among Vendeans and Bretons. The municipal council was interviewed by deputations of the inhabitants, but for some unknown reason there is a prejudice against the Porte-Prison, and in a little time no trace of it will remain.

MESSRS. WINSOR & NEWTON have published in their shilling series a capital little book by Mr. OWEN W. DAVIS on "The Rudiments of Decorative Painting." It is intended mainly for the use of amateurs, and, as the directions are clearly expressed, we may expect a great improvement in the decoration of suburban villas. The style adopted by Mr. DAVIS is a compound of Pompeian and Italian, and, from his great experience and skill as a designer, it is hardly necessary to say that everything is well treated, and that his advice may be followed with confidence.

FOR some weeks past the architects and builders of Dublin and the Corporation officials have been a little excited about some of the Corporation contracts. It was said that favouritism was shown in the letting of contracts, and in the lenient manner of overseeing the work. Reports were obtained from independent architects which were not favourable to the existing system. It was not considered wise that suspicions should grow, and on Monday the following resolution was adopted by a majority of the Corporation:—"That the Institute of Architects in Ireland be requested to name three architects of their number to inquire into and report to Council—(1) whether the plans and specifications for the erection of the Fire Brigade Station were drawn so as to provide for the construction of a suitable station, having regard to the site proposed, and if due care was taken to protect the Corporation with respect to extras on the original contract; (2) whether the work was properly carried out by the contractor." Whether by accident or design the full title of the Irish Institute, it will be seen, is not given, for the Irish Institute stands in the same position as the British, since it has the privilege of being styled "Royal." Another resolution passed on the same occasion is a sign of a new departure in contracts, and will give extra work to builders' clerks. It is as follows:—"That in all building contracts tenders must be accompanied by a priced bill of particulars, the details of which must be added up, showing the total amount as detailed; and should the detailed particulars exceed by more than 10 per cent. the sum tendered for, such tender shall not be received. The detailed estimate which is accepted shall form the basis for all extra works, omissions, or variations, unless at any time it should appear that such prices have not been fairly made up; and should it appear that any addition to or deduction from the gross amount of the estimate, or any section thereof, has been made by way of percentage, so as to increase or reduce the amount of the net sum at which the tender is offered, each rate in detail, in being applied to the schedule of prices, will be subject to increase or reduction by a corresponding percentage."

LITHOGRAPHY is so essentially a French art (for although invented by a German, it was perfected in France) that the death, on Friday last, of the artist who was the *doyen* of the artists is not allowed to pass unnoticed. ISIDORE LAURENT DEROY had reached his ninetieth year. He received a medal as far back as 1835, and twenty-six years afterwards a *rappel* of a similar honour. Like so many artists of the same class, he drew his own designs on stone. DEROY was best known as a landscapist, and albums containing collections of his views along the chief rivers of France and in Italy are familiar to collectors.

WE have drawn attention more than once to the good work which the Plumbers' Company have undertaken in establishing a register of qualified plumbers. The guests who accepted the invitation to dinner of the new Master, Mr. A. STUART KNILL, were a recognition of the value of the service which the Company has rendered to the country. Sir ANDREW CLARKE did not exaggerate when, speaking as a physician, he said the new movement was the commencement of a revolution aiming at the sanitation of our houses, in which women and children spent three-fourths of their lives, and the sanitary influences of which at present were detrimental alike to the present and to the future. The Master stated what every architect must know to some extent, that the plumber's craft is subject to a continual influx of unqualified men, and that the present state of affairs is owing in part to the falling off in the apprenticeship system, and in part to the rapid extension of buildings and the consequent competition of builders, obscuring the real lines of distinction between the crafts, and allowing labourers and others than plumbers to carry out plumbers' work. If the public will support the Plumbers' Company by giving a preference to builders who employ qualified workmen, there will soon be an end to the dangerous practices which are an enduring cause of illness.

A CONGRESS of Swiss engineers has been held at Lausanne, where it was decided that it is feasible to construct a tunnel through the Simplon. It would be about ten miles in length, and the cost is estimated at 2,500,000*l.* With modern appliances the work could it is said be accomplished in seven years.

MESSRS. RAPHAEL TUCK & Co. have this year introduced one striking novelty in their Christmas cards. It is a large size copy of the painting by RAPHAEL which was lately acquired for the National Gallery at so large a cost to the nation. The work is difficult to reproduce, but the copy is so successful that it will bear comparison with the prized works of the Arundel Society. Both colour and drawing are admirable. It is to be hoped that the firm will meet with enough success to warrant them in undertaking similar works hereafter. The outlay for a work of the kind was necessarily large, for the style of execution differs from that of the majority of oleographs and other prints in colour. All the cards which are produced this year by Messrs. TUCK show good taste in the selection and production of the subjects.

PALLAS, JUNO, AND VENUS.

MR. WATTS, R.A., is one of the few artists in England who are eager to co-operate with architects in producing decorative work. Like Mr. ARMITAGE, he was willing to paint on walls without any thought of profit. In his evidence before a Royal Commission in 1863 he said:—"I insist upon mural painting for three reasons—first, because it is an exercise of art which demands the absolute knowledge only to be obtained by honest study, the value of which no one can doubt, whatever branch of art the student might choose to follow afterwards; secondly, because the practice would bring out that quality and nobility deficient in the English school, but not in the English character, and which, being latent, might therefore be brought out; and, thirdly, for the sake of its action upon the public mind. For public improvement it is necessary that works of sterling but simple excellence should be scattered abroad as widely as possible. At present the public never see anything beautiful, except in exhibition rooms, when the novelty of sight-seeing naturally disturbs the intellectual perceptions. As I believe the love of beauty to be inherent in the human mind, there must be some unfortunate influence at work; to counteract this should be the object of a fine art institution, and I feel assured, if really good things were scattered among the people, it would not be long before satisfactory results exhibited themselves." It was with that intention he painted the large fresco in the hall of Lincoln's Inn, and it inspired the sacrifice through which he made over so many noble works to the public.

The etching from *L'Art* which we publish to-day, by permission of Mr. WATTS, is from a painting which gives a new version of an ancient theme. The three goddesses have often been represented in painting and sculpture, but in no other case is so little to be found of the sensuous. Mr. WATTS has painted the figures in a Greek spirit.

ARCHITECTURAL ILLUSTRATION SOCIETY.

NO. 40.—SOUTH MARSTON CHURCH.

STAPLE INN, HOLBORN.

THE opposition to the sale of Staple Inn has benefited the Prudential Assurance Company, since the buildings were sold at a lesser rate than was anticipated. In Mr. WARREN'S sketch the Holborn elevation is given, and this part is more suggestive of antiquity than the interior court. The illustration will be a record of one of the last blocks of Old London.

THE HALL, SNOWDENHAM.

THE hall is part of a house built for Mr. ROBERT COURAGE, at Bramley, Surrey. The exterior has been already illustrated in this journal. The work is of oak, carried out by Mr. PINK, builder, of Milford, Godalming. The panels of the double stairs were carved by Mr. WALTER SMITH, of Lambeth, and the rest of the carving done by J. EASTAUGH, under the care of Mr. PRATT, of Guildford, from drawings supplied by the architect, Mr. RALPH NEVILL, F.S.A., of Guildford and New Bond Street. The drawing was in this year's Royal Academy Exhibition.

MR. BURGES'S WORK AT WORCESTER COLLEGE

A PARTY of members of the Oxford Architectural and Historical Society lately visited Worcester College, where Mr. Daniels, in the absence of Mr. Parker, acted as *cicerone*. He said that in 1877 the decoration of the Hall was commenced from Mr. Burges's designs, but so elaborate were they, so thickly did he heap ornamental details one upon the other, that the authorities were forced to cry, "Hold, enough!" Many a long sitting did the committee spend over the designs, Mr. Burges using all his persuasive eloquence against the obstinate resolutions to be as parsimonious as was befitting.

In the chapel Mr. Daniels said that he felt much difficulty in discharging his office of iconographist to such a mass of details. He would, however, touch as briefly as he could upon the salient points in the design. He pointed out that the roof was decorated with pictures of the Temptation of our first parents and their Fall, and that the general design of the walls was a mingling of the ideas expressed in the Te Deum and the Benedicite. The words of the former are worked in the wood panelling at about two feet from the floor, the latter runs round the cornice. We have, as it were, a combination of natural and revealed religion—one section of the border to the roof gives the theological virtues, the other the natural ones. The spaces between and about the windows are filled with examples from the different genera of birds, beasts, and fishes, creatures inhabiting or existing in the air, the water, or the earth, the various animate and inanimate objects which the three holy children invoked to bless and praise God for ever. On a gold ground, about level with the eye, are depicted groups which illustrate the opening verses of the Te Deum. On the north side the heavenly host, and facing them the representations of the earth, or human society; next to these the prophets, and opposite to them the apostles. Last, on the south side, the martyrs, the holy innocents, Stephen, and others, down to Huss, Jerome of Prague, Latimer, and Hooper. The opposite series represents the Church in its various manifestations and energy—Augustine and Ambrose, the Empress Helena, and Monica, Charlemagne and Benedict, Catherine of Sienna and Elizabeth of Hungary, Thomas Acquinas and Wycliffe, Luther and Pascal. The series of figures were executed by Mr. Henry Holiday. On the floor is the completion of the history of the Church, viz., within the sacrarium, the Parable of the Sower, in the body and above the lectern the four doctors of the Western Church, and below it a still further limitation to the English branch of that Church, kings, martyrs, builders and saints. The windows have for their subject "Christ the Light of the World." Sir J. Millais furnished a design for one of these, but Mr. Holiday, an artist who has made glass his speciality, was finally fixed upon, and the actual manufacture was entrusted to Messrs. Lavers, Barraud & Westlake. The gilded figures in the four angles of the building are the four evangelists.

Professor Westwood, in thanking Mr. Daniels for his explanation of the "motive" of this most noted of Mr. Burges's designs, expressed his opinion that there was no English building extant in which so much study had been devoted to a scheme of ornamental decoration, and such care given to the execution of the designs.

SOME THOUGHTS ON APPLIED ART.

AT the annual meeting of the School of Art, Winchester, on November 23, the Mayor in the chair, Mr. Hugh Stannus, Lecturer at the National Art Schools, South Kensington, distributed the prizes and gave an address to the students, of which the following are some of the points:—

I have been asked, by those who have the well-being of this school at heart, to say a few words to you this evening. I could discourse most eloquently, in other men's words, of the dignity of art, or I might endeavour to speak to you on those higher arts of architecture, sculpture, and picture-painting; but you have heard on these branches in former years from greater men.

It may be that you expect me, as a South Kensington man, to defend it and all its works. That is not my business; but I may say that whatever mistakes may have been made were the mistakes of those who were initiating a new order of things, and had to learn by their failures. Critics and assailants are plentiful enough; but when you consider the steadfast endeavours to grapple with the difficulties of the art education of a nation which, in the systematising of education, was a century behind, you will admit that the early errors of judgment may be condoned. They have erred, but that is no reason why every critic in want of a theme should think South Kensington a fair mark. As a part of the system, the museum and the libraries, each the best of its kind, must be mentioned. They tend to preserve the balance between craze and continuity. Our English art will be very much like our language, gathering and assimilating the good and characteristic points of others, and it will have its periods of craze and of pulsation backwards and forwards, like the piston of an engine; but institutions like the South Kensington, and like this school, serve the function of the flywheel, carrying on the momentum from period to period, and, like the old colleges in the "dark ages," are the true conservators of the energy of the time, handing it down to posterity. Still, though not speaking on the general South Kensington question, there are some details of our aims, our school work, and our minor methods there, which may be interesting and useful to you here.

Amateurs.

But, firstly, let me say a few words to you who are Amateurs. I am pleased to see you, and to have seen the results of so

much good work done by you. I congratulate you on having a place and appliances and a master so well fitted to help you as Mr. Roberts. You will find how painting adds to our enjoyment of this beautiful world. Those of you who paint landscapes will bear me out in saying that the enjoyment increases with the powers of imitation; and that there are more and greater beauties in Nature eluding you at first and only to be seized as you progress in power; and this will be an endless enjoyment. You will find that your study, whether in landscape or in any other branch, will give you a power of expression you would not otherwise gain. The habits of accurate observation, clear draughtsmanship, and sympathetic tone and tint will give you what may be termed another language. Further, the association with beautiful objects will refine your taste. And, lastly, by the power of the purse, by your judgment in purchasing, you can bring pressure to bear on the manufacturers. Making good designs is only half the battle: getting the public to purchase the good and to refuse the bad, is the other half; and we look to you to see to this. If you decline to buy, the shops will cease to keep such ridiculous affairs as some of the "novelties" we see: the inkstands with the ink contained in jockeys' caps, and the pens supported by combinations of whips and spurs, and other equally foolish things.

It may be interesting to recall what happened at the inception of the State-teaching of art in England. The Schools of Design were first set up to teach design to designers only; it was then found they were in advance of the public taste, and the scheme was altered to teach everybody—the purchaser as well as the producer. This has long ago had its effect in the higher class of work which is purchased, and it rests with you to raise the standard and to boycott all vulgar novelties.

If I may venture to speak on so delicate a subject as ladies' hats, I would like to say how grieved all artists are to see the fashion of wearing birds or portions of birds' bodies. They are doubtless purchased without thought because they look pretty; but the purchase is an encouragement to the slaughter of beautiful creatures whose only offence is that they are beautiful. An Italian friend over here some time ago, in remarking on what he saw in London, was impressed, not with its size or populousness, or with the buildings, but with the tameness of the "piccoli uccelli" he saw everywhere. I was proud when he attributed it to the humanity of the English, and have been since pained and humiliated at this fashion of birds, which, though not so degrading as the attendance of aristocratic and other females at disgusting and brutal pigeon-shooting matches and battues, is an encouragement to cruelty that the study and associations of art should counteract.

Plant Form in Design.

I am glad to observe that you paint Plants from Nature well and much. This is an important branch of the study in any school of applied art. Pray note, however, that this is not the end of your work, but only a means or a commencement. After the most careful and painstaking study of a plant, you will then be in a position to make use of your acquired knowledge, and to apply it decoratively. You might be able to paint flowers as well as Monnoyer or Van Huysum; but if you stop there you will only have produced pictures of them. When, however, in addition to this, or rather in continuation of it, you proceed to apply them decoratively; you have gone a step further and done "a bigger thing," you have utilised your knowledge for the benefit of others, you have contributed to raise and beautify the objects which surround us, with which we are in daily contact, and which have, consequently, a greater though unfelt influence over us than all the mere furniture-pictures we hang about on our walls.

The use of natural foliage in decorative work fell into disrepute some years ago, principally through the unsound teaching which had prevailed. Students were then taught to make "botanical analyses" of plants, to cut through their stalks and buds and flowers, and make "patterns" out of these sections; to draw the flowers spread out flat upon the ground of the design, as if they were pinned to the board, like butterflies' wings are set out by entomologists; and to pull the flowers to pieces, drawing the petals, &c., in a similar manner. This, which has been termed the "vivisection of plants," is useful enough in a botanical museum, but altogether out of place in decorative art.

There was then another method in which the student was taught: first, to sketch out what he considered in his own mind to be good curves and spiral scrolls; and then to bend about the selected plant or to stick leaves and flowers on to these scrolls, utterly regardless of their growth in Nature. This is even worse than the vivisection method, and is little short of blasphemy. The Great Designer has settled how each plant shall grow; how its stems and branches shall separate, each to seek its own share of air and sunshine; how its leaves shall stand erect or droop, according to their functions, but always in perfect beauty of subtle foreshortening; and then comes this second theorist who, forgetful of the fact that the forms of the branches are as much a part of the character of the plant as are those of the leaves and flowers—and so dull that he cannot see the beauty of natural growth in stem and branch—proceeds to clothe his own ugly, uninteresting stems with these leaves, &c. And, not content with that, he flattens them out as before, and gives us the flowers with all the delightful change of curve which is seen in the perspective ground out of them in his mechanical mill. All this, which is merely a masquerade of Nature, is termed "Conventional" by its teachers; and hence the very word "Conventional" has become a term of opprobrium. It was a mere cloak for incapacity; and is, I am glad to say, dying out.

The True Conventionalism.

The true Conventionalism for us, either in plants or other things, lies, not in altering the growth or flattening out the forms, but in the method of representation according to the material and process we are using, *i.e.*, according to the technical limitations. If we paint with a complete palette on a perfect ground—*i.e.*, if we have perfect means—we may aim at a perfect result. But so far as our means are imperfect, when, *e.g.*, we must forego the nicety of tint in colour and be satisfied with a limited number of tints, as in wall-papers, or when we have to omit colour altogether trusting to texture, as in a brocade, we may then simplify but not misrepresent (as Mr. Ruskin says) the beauty we cannot wholly give. The method at South Kensington, for which I am responsible in some degree, is an effort in this direction.

The student, having made a careful painting of some simple flowering plant, is then required to make a design from it, either in a panel, a border, or as a diaper. This design involves a sympathetic knowledge of the plant and its ways, because, as you will see in the Art Directory of the Department, it is to be treated "without doing violence to the natural growth of the plants." And, further, it requires a decorative feeling for the particular shape chosen, in order that the work or pattern shall be fairly distributed, and that no angles or spaces shall be left vacant or appear bare.

Technical Treatments.

When the design is settled, and the whole is faithful in resemblance, pleasing in distribution, and harmonious in colour; the student is then brought face to face with Technical questions.

These are of the highest importance. We have been too long content to rest on our oars; we have relied too much on the quality of our materials and the excellence of our machinery. If our manufactures are to hold their own in the markets of the world, the cry must be, now and for a long time to come, technical education.

There is no provision for the actual teaching of technical processes to handicraftsmen under the rules of the Department, except as regards the underlying art and science of each; but it is possible to show how they affect design; and this side of technical education is impressed on the notice of the students, some of whom, like our National Scholars, are the designers of the present; and others, like the Masters in Training, will be the art teachers of the future. Accordingly, every master, as part of his academic work, in addition to the plant design I have mentioned, has to prepare three modifications of it, showing how he would treat that same design for three differing manufacturing processes, the particular three being chosen by himself. He then realises that the intricacy of a printed tile cannot be worked in embroidery, and he simplifies by omitting unimportant details; that the blending of tints, which is so great a charm in embroidery, is not possible in a woven damask, and he draws the leaves, &c., in such a manner that they will be effective without shading, and so on. And thus he learns the technical limitations, is saved himself, and, let us hope, will save others from making designs which are either impracticable, or which require alteration at the risk of spoiling them in adapting them to the particular process of manufacture for which they are intended.

I have reason to know that this method, introduced about four years ago, is bearing fruit; and I anticipate great things in these two directions, namely, (*a*) the natural treatment of plant form, and (*b*) the technical treatment in design.

Design.

With regard to design in the abstract, I would suggest, if your committee offer any prizes, that the so-called "Original" Design should not be asked for, but that the students should be invited to state, in the margin of their drawings, the source whence they have adapted their work. Fitness is a higher quality than originality. In all good designs the idea has been taken and improved upon from something which has gone before. In the gradual evolution of our glorious Gothic, each cathedral or church was a development of the features or an avoidance of the faults contained in its predecessors. So to you students I would say, do not be ashamed of fairly owning your indebtedness. Try fitness and fairness first, and in good time, if you have it in you, originality shall be added unto them

I am interested to know what is the local outcome of your school. I observe that three years ago Mr. Stopher, who was then your mayor, suggested a class of wood-carving, to the end that carving might be carried on in the home in winter, as in the Black Forest and Switzerland. This was a most valuable suggestion; it is to be hoped that the idea may not be lost sight of, but take shape as a mercantile speculation. Why should there not be Winchester furniture and Winchester chairs? The material lies close at hand, and is cheap enough. What is required is that it shall be made in sympathy with the old tradition of utility and comfort first, and quaint shaping added thereto. There is enough of old work in your grand old city to serve as models in founding a local school of Winchester work, which would create a demand; and so with other handicrafts.

As a help in your studies, the class for teaching the characteristics of the Historic Styles will be found to be of great use. And here I would add a caution—not to attempt to cover too much ground. Do not seek to know in a single year everything that has been done from the Pharaonic times to A.D. 1800. You are learning, not archæology, but art; and, moreover, the extent of your field would confuse and discourage you. Seek rather at first to know well a limited portion—say, our English art from A.D. 1200 to 1500, or from 1500 to 1800, according to your taste; and afterwards, when you have realised the growth of style and the changes which always accompany living growth, you will be the more able and anxious to know the beginnings of things in other countries and earlier times, tracing back as in a pedigree to the Lake-dwellers.

Art and Artists.

And, for the general good, let me say: do not try to be Artists "unless you cannot possibly help it." A young friend was advised not to write poetry unless he could not possibly help it. So with art. Do not take it up because it is genteel, or because it makes you an interesting person among your sisters and your cousins and your aunts, or because you will be able to let your hair grow long, and generally to be rather slovenly in dress. But if, after hard training, you still feel that you are willing to be a fool for Art's sake, then there is nothing for it but to follow your highest inspiration. You have heard of the shepherd-boy of Vespignano, who could not help it, who drew his sheep, his fellows, and everything he saw, who, taken home by the Florentine, continued to draw because he could not help it. If any one of you feel this irresistible inspiration, if it prove superior to every trial of his patience and endurance, it may be given to him to stand beside Giotto, because he could not help it. These cases are few, and do not come once in a century, and anything I can say will neither haste nor hinder; for the rest, do not be an artist unless you cannot possibly help it.

And do not seek to be called "artists." The word is very much abused, not only in that form, but as an adjective in such odd terms as art coal-scuttles, art tea-trays, art door-mats, &c. Do not use it. Call yourself a landscape-painter, a figure-painter, a pattern-designer, if that be your choice, or a craftsman if your work lie in practical grooves; but shun the snobbish habit of dubbing artist those who follow only some one small branch of the great art which is one and indivisible, and reserve that title for the epoch-making men like Giotto, Michel Angelo, Stevens, and men of their mould.

And finally, do not let the prizes you have obtained, or the well-deserved and well-intended gratulations of your friends, lead you prize-winners to suppose you are something more than usual. There are probably in all competitions and examinations some who ran well, and deserved but obtained no prize. Such I congratulate. You have that singleness of reward—the consciousness of desert and knowledge. Believe me: Prizes are good, but Knowledge is better.

THE WELLINGTON MEMORIAL, HYDE PARK CORNER.

THE executive committee met on Saturday, November 27, at Apsley House, to determine the site for Mr. Boehm's new equestrian statue of the Duke of Wellington. There were present the Prince of Wales, chairman; the Duke of Wellington, the Duke of Westminster, Lord John Manners, Lord Northbrook, Lord de Lisle, Sir Richard Wallace, Baron F. Rothschild, Sir James M'Garel Hogg, Sir Frederick Leighton, Mr. H. Primrose (representing Her Majesty's Office of Works), Colonel A. Ellis, Mr. Farquhar, and also the sculptor, Mr. J. E. Boehm, R.A.

The plaster cast on a temporary pedestal had been transferred from the lower enclosure (No. 2) opposite St. George's Hospital to the enclosure (No. 1) opposite Apsley House, and being fixed to a turntable the committee had an opportunity of judging of its appearance from different aspects.

It was finally unanimously decided that the most favourable position will be to place the statue with the Duke facing Apsley House. The enclosure (No. 1) will be altered in shape, and probably made circular or nearly square. The platform ground will be levelled and paved, and the rest of the "island" paved on a hanging level. This decision meets with the entire approval of the present Duke of Wellington's family.

The pedestal will be much more important—higher and broader—than the temporary wooden one now indicates. It will be of red-polished Aberdeen solid granite blocks, with four colossal bronze supporters—one at each corner.

Mr. Boehm's admirable sketch-model represents four private soldiers in uniform of the period of Peninsular and Waterloo campaigns—one of each nationality; a man of the Foot Guards, a Highlander (42nd), an Irishman (27th Inniskillings), and a Royal Welsh Fusilier (23rd). These figures themselves excellently convey the national characteristics of each people.

A few minor alterations in the actual portrait model suggested themselves to the committee, which will be adopted by the artist. The Duke is thought to be represented as rather older than was intended. The details of the uniform and horse trappings are exactly copied from the actual things still in the present Duke's possession.

On the whole both statue and proposed pedestal were approved. Unfortunately it will be a long time before the public can see it erected in its place, as the casting of the bronze and its four supporters will occupy nearly a year.

It is suggested to plant the lower enclosure (No. 2) with trees, and possibly, if funds admit, to place a handsome bronze 5-light candelabrum in the lowest and smallest enclosure (No. 3) —a refuge for the street crossing opposite Grosvenor Crescent.

THE LEEDS FINE ART GALLERY AND MUSEUM.

THERE were eighteen sets of designs sent in for the Fine Art Gallery and Museum, Leeds, which was prescribed to cost 8,000*l*. The following were the competitors:—Mr. C. S. Nelson, Mr. J. P. Kay, Messrs. Perkin & Bulmer, Messrs. Dodgson & Braithwaite, Messrs. Fraser & Sugden, Mr. J. H. Greaves, Mr. W. H. Thorp, Messrs. Chorley & Connon, Mr. George Corson, Mr. J. Hall, Mr. A. Neill, Mr. W. Bakewell, and Mr. B. Wilson, all of Leeds; Mr. C. H. Mileham, London; Mr. J. Johnson, London; Mr. H. A. Cheers, Twickenham; Mr. H. A. Matear, Southport; and Mr. P. Ogden, Manchester. The plans were first reduced to eight, and afterwards to three, viz., those by Messrs. Fraser & Sugden, Mr. George Corson, and Mr. W. H. Thorp. On Friday last it was decided to adopt Mr. Thorp's design, the second prize going to Messrs. Fraser & Sugden.

Mr. Thorp's design is in the Italian Renaissance style, in harmony with the architecture of the adjoining Municipal Offices and Public Library. The leading features of the latter, sill courses and cornices, are carried at the same level, so as to bind, as it were, the two buildings together. The elevation to Centenary Street, he suggests, should be faced with the best Bolton Wood stone; also the return angle fronting to Alexander Street; the remainder of the Alexander Street frontage to be of the best hand-pressed brick. Mr. Thorp, in planning the internal arrangements of the building, has been to a large extent guided by those of the Walker Art Gallery at Liverpool and of some of the more modern courts of the South Kensington Museum. Generally speaking, he has sought to give effect to the wishes of the committee. The entrance to the gallery and museum is that of the Public Library in Centenary Street. Those who visit that institution know that the reading and newsroom is on the right of the entrance. It is proposed that this large apartment shall be devoted to the purposes of a sculpture gallery, and that another reading-room shall be provided in the new building. The sculpture gallery will give access to the museum and picture galleries, as well as to the reading-room, under an arch formed at the end of the apartment. Passing under this, a vestibule 30 feet by 20 feet is entered, and immediately beyond is the situation of the new reading-room, the dimensions of which are 100 feet by 32 feet, the superficial area being about the same as the present reading-room. The new room—divided into three bays, with columns and arcades—will be well lighted from Centenary Street on the one side, and by glass screens (which will receive light from the glass roof of the museum court) on the other. Another entrance to the reading-room is provided at the corner of Alexander Street and Centenary Street. Going back to the vestibule, and turning to the left, will be found the staircase hall—41 feet 6 inches by 36 feet. The principal staircase starts thence in two flights, which meet on the central landing, and proceeding by a wider flight of stairs an upper hall on the first floor is reached. Before noticing the arrangement in that part of the building, it may be well to describe what further use is made of the ground floor. There is an archway 9 feet wide and 15 feet in height

underneath the centre of the staircase, and this gives access to the central museum court. The room is 60 feet by 36 feet, and is surrounded by arcades. On two sides of it are open arches, and on that next to the reading-room are the glass screens before mentioned. The court is two storeys in height, and is provided with an iron and glass roof. Adjoining it is an office for the curator, and another room which may be used as a cloak-room. Connected with this central court are two additional courts, for museum purposes, access to them being through the arches on two sides. One of them is 65 feet by 25 feet, and the other 60 feet by an average of 31 feet, and both are well lighted. There is also a small gallery or anteroom on the ground floor, having an entrance from the staircase hall. This leads to a larger gallery, intended for the permanent reception of pictures, and to another for cabinet pictures. The former is a rectangular apartment, 42 feet by 36 feet 6 inches; it is lighted by a glazed lantern in the roof, and the ceiling is coved. The latter is 24 feet by 21 feet, and is divided into two sections by a central screen, receiving light from the roof.

Ascending the staircase, we find on the first floor an upper hall, 36 feet by 41 feet 6 inches. There are four galleries on this floor, and they are so arranged that the visitor, turning to the left, can make a tour of them and reach the staircase again without inconvenience, passing on the way over a balcony which projects into the central court. One of these galleries is 42 feet by 32 feet, the second is 87 feet by 32 feet, the third 65 feet by 25 feet, and the fourth 60 feet by 24 feet. One will be utilised for a permanent art collection; the other three for loan collections and special exhibitions, space being reserved, however, for a water-colour collection. All these rooms are entirely lighted from the roof, and have coved ceilings. The walls are to be boarded, not plastered. The upper staircase hall is treated with pilasters and detached columns; the sides of it are coffered, and in the centre is a large glass dome for lighting purposes.

The whole of the structure is, according to the plans, fireproof, and fireproof doors running into grooves in the walls separate the different galleries from each other. There is a large hoist for the conveyance of pictures to the upper galleries. Ample lavatory accommodation is provided. In the basement are two large warehouse rooms, with a separate entrance from Alexander Street. These might be let off or retained by the Corporation, as might be deemed expedient.

With respect to the cost of the building, Mr. Thorp says that has been gone into most carefully by him, and he "would guarantee that he would have no difficulty in getting the work carried out according to his drawings and specifications for the sum named in the conditions, viz., 8,000*l.*" At the same time, he remarks, for 10,000*l.* greater satisfaction could have been given in the execution of the work. The total amount is 7,999*l.* 13*s.* 6*d.*, made up of:—Masons' work, 2,997*l.* 12*s.* 10*d.*; principal staircase, &c., 300*l.*; carpenters, joiners, ironfounders, plumbers, glaziers, and slaters, 1,285*l.* 9*s.* 9*d.*; other carpenters' work and ironwork, 862*l.* 19*s.*; fireproof flooring, 1,737*l.* 13*s.* 6*d.*; plastering, 356*l.*; painting, 70*l.*; heating, 200*l.*; gas, 100*l.*; ventilation and hoist, 90*l.* A system of hot-water heating is provided for, and arrangements made for lighting by gas or electricity.

THE ROYAL JUBILEE EXHIBITION, MANCHESTER.

THE following prospectus has been issued by the committee of the Fine Arts Section:—

"In an Exhibition held to commemorate the jubilee year of the Queen's reign, it is thought appropriate to form a collection of the best works by artists of Great Britain and Ireland who have lived any time during the last fifty years. Great strides have been made in art in the United Kingdom in the thirty years that have elapsed since the holding of the Manchester Art Treasures Exhibition, but in none of the numerous exhibitions that have been held has there been any attempt to bring together the best works of art that have been produced in the Victorian era. When it is remembered that the roll of illustrious artists whose works are thus eligible for exhibition includes such names as Turner, Wilkie, Stanfield, Mulready, Leslie, Muller, Landseer, De Wint, Cox, Prout, Hunt, and Copley Fielding amongst painters, and Chantrey, Foley, and Gibson amongst sculptors, it will be readily seen that a splendid collection may be formed, not unworthy of succeeding the memorable collection of 1857. It has been determined therefore to form a loan exhibition of such works, to include paintings in oil and water-colour, drawings, sculptures, engravings, etchings, and woodcuts. Special care has been taken in the construction of the portion of the exhibition building intended to be devoted to fine arts. It will be built of brick, and will be completely isolated from the main building by strong brick walls, with iron sliding fireproof doors. The walls will be boarded inside, thus securing immunity from damp. The most complete arrangements will be made for watching night and day, and the lighting will be so arranged that under no possible circumstances can injury arise to the works exhibited. The galleries will be lighted with incandescent electric lamps. The committee undertakes to collect and to return the works of art that may be lent, and to bear the cost of transit, and will be prepared to cover art exhibits by insurance when required. The Exhibition will be opened early in May 1887, and will remain open about six months. The committee appeals with confidence to the owners of pictures throughout the country to assist, by the generous loan of some of their treasures, in making this a truly representative national exhibition of the art of the past fifty years."

As the committee proposes to form an exhibition of the best pictures, sculptures, &c., made during the last fifty years, all the leading artists who are now living have been asked to name the works which they would prefer to be represented, and these works it will be the object of the committee to obtain on loan from the collectors who possess them. In regard to the pictures by deceased artists, the committee will carefully select specimens from various private collections.

Offers of assistance have been received from Sir Frederick Leighton, president of the Royal Academy; Sir John Gilbert, president of the Old Water-Colour Society; Sir James L nt n, president of the Institute; Sir J. E. Millais, Mr. G. F. Watts, Mr. Alma Tadema, Mr. Briton Rivière, Mr. Burne Jones, and many other well-known artists, and it is gratifying to learn that the efforts of the committee are likely to meet with success.

THE FINANCIAL RESULTS OF EXHIBITIONS.

A CORRESPONDENT of the *Times* supplies the following abstract of the accounts of various exhibitions between 1851 and 1886:—

The principal exhibitions held up to the present time have been—London (1851 and 1862), Paris (1855, 1867, and 1878), Vienna (1873), and Philadelphia (1876). It has not proved easy to get hold of actual balance-sheets of all the foreign exhibitions, but sufficient information is available about all of them to enable a fair comparison to be made, and of our own two full particulars have been published in the reports of the Royal Commissions appointed for each exhibition.

The total receipts for the 1851 Exhibition amounted to 506,243*l.*, of which 186,000*l.* was surplus profits. This total was made up of 423,792*l.* for admissions, 67,896*l.* subscriptions (which many thought ought to have been returned), together with payments for the refreshment contract, &c. As there were 6,039,195 visitors, the amount received at the doors represented about 1*s.* 6*d.* a head. The buildings cost 169,998*l.*, maintenance and police, 24,524*l.*, personal services, 67,309*l.* The prices of admission were 5*s.*, 2*s.* 6*d.*, and 1*s.*; there were also two days at 1*l.* Though there were twenty-seven 5*s.* days and thirty 2*s.* 6*d.* days, nearly four-and-a-half of the six million visitors paid their shilling at the doors.

In 1862 the total receipts were 459,631*l.* This amount was insufficient to meet the outgoings, and, in order to avoid a call on the guarantors, the contractors, Messrs. Kelk & Lucas, reduced their claims by about 65,000*l.*, and Mr. (afterwards Sir John) Kelk made a donation of 11,000*l.* to the funds. In consideration of the abatement the contractors took over the whole of the property of the Commission. The admissions amounted to 408,530*l.*, the refreshment contract to 29,285*l.* The chief items of expenditure were—buildings, 329,001*l.*; roads, 13,358*l.*; salaries, 45,778*l.*; police, 19,435*l.* As there were 6,211,103 visitors, they may be said to have paid much about the same as those in 1851, 1*s.* 6*d.* a head.

Of the three Paris Exhibitions none was a financial success, but as they were all Government undertakings, this was probably not considered a matter of the greatest importance by the projectors. In 1855 the charge for admission was on several occasions lowered to 20 centimes, and there was one actually free day. The result of this was that 5,162,330 visitors only paid 128,099*l.* In 1867 6,211,103 visitors brought in 408,530*l.*, but the expenses were heavier. In 1878 the expenses were enormous, and the deficiency is stated to have been considerable. The same is also understood to have been the case at Vienna in 1873, when there were 6,740,500 visitors with a financial result of 206,477*l.*

The accounts of the Philadelphia Exhibition are complicated by their connection with the purchase of Fairmount Park for the city, and also by the arrangements under which the necessary funds were obtained by the issue of stock. They are, however, set out in full detail in the reports of the Centennial Commission. From these it appears that 8,140,193 visitors entered the Exhibition, and paid 798,675*l.*, or about 2*s.* each. The charge for entrance was 50 cents (a little more than 2*s.*) The actual result of the Exhibition was a financial success, but the funds of the Centennial Commission consisted in part of donations and appropriations, and these would have to be taken out to get at the real commercial outcome of the Exhibition.

If the accounts of the Fisheries and Health Exhibitions be summarised in the same way, we find that the Fisheries had a gross receipt of 162,903*l.*, of which 117,869*l.* was obtained by the admission of 2,703,051 visitors (about 10*d.* each), and 8,702*l.* was subscribed; over 11,000*l.* of the rest is rent, paid or to be paid by the Health and by the Colonies. The Fisheries Buildings cost 44,238*l.*; their electric lighting, 10,397*l.*; salaries and wages, 14,098*l.* (including police); conferences, juries, and jury awards, 11,288*l.*; music, 5,255*l.*; gardens, 3,740*l.* The surplus was 14,752*l.*

The Health Exhibition had a total receipt of 237,048*l.*, of which 178,509*l.* was derived from 4,153,390 visitors (about 10*d.* each). Donations amounted to 11,824*l.* 12,023*l.* was a merely nominal asset, since it represents an amount due from the Inventions for buildings and plant, but remitted. New buildings, including Old London, cost 47,045*l.*; electric lighting, 23,140*l.*; rent, 16,888*l.*; and rates and taxes, 1,573*l.* Salaries and wages, 21,987*l.*; juries and conferences, 7,832*l.*; music, 14,181*l.*; gardens and illuminations, 7,611*l.* The Health surplus was 3,557*l.*

As regards the Inventions, we only know that the total receipts were 208,490*l.*, against an expenditure of 213,927*l.*, leaving a deficiency of 5,437*l.*, which may be extinguished by the adjustment of matters now outstanding with the Colonies.

In comparing the recent and the older exhibitions, it should be borne in mind that the latter were always closed at dusk, and that the heavy charges for artificial illuminations were therefore avoided; also that the cost of the garden illuminations and of the illuminated fountains is additional.

ST. SAVIOUR'S, SOUTHWARK.

ON November 15 the wardens and the vestry clerk had an interview with the Bishop of Rochester to express the wish that the restoration of St. Saviour's, Southwark, should be begun as soon as possible. The following is the Bishop's reply to Mr. N. F. Horne, Warden of the Great Account:—

"Selsdon Park, Croydon, November 16.

"Dear Mr. Horne,—It may be convenient that I should put down in writing the reasons which make me apprehend that to set on foot just now so great and important an undertaking as the restoration of St. Saviour's Church would be not only to court a melancholy failure, but also to postpone to a very distant future what we all hope to see accomplished thoroughly, it may even be soon. The key to the success of our great enterprise, which, if to be done at all, must be so done as to stir and deserve substantial sympathy not only from Southwark and London but from all England, will be found in its opportuneness. I cannot bring myself to think (willing as I should be to be persuaded to what is as near my heart as it can be to yours) that it would be wise to set it on foot now. The commercial distress still continues; agricultural troubles, perhaps, have not touched the bottom. A Church House, which for a year or two to come will tax the resources and energies of all English Churchmen to make it worthy at once of the Church and the Queen, must divert from any local effort like this aid which otherwise might have been given to it. Under the very shadow of the church we love and wish to restore lies Guy's Hospital, languishing from the severe drop in its income through a diminished rent-roll, and endeavouring with an admirable courage and not too much success to raise the large sum of 100,000*l.* People cannot give to all these things at once. Should we have any chance, in the face of these circumstances (for which, indeed, we are not accountable, but of which as men of sense we must take account), of raising a fund which, before we have done with it, will require the best part of 30,000*l.*, for a task which will be helped from outside only on the condition of its being done with completeness? Of course, it is quite possible that I am too prudent, and if a memorial to that effect should reach me from the great firms in South London, without whose counsel and sympathy it would be madness to make a start, and from the principal landowners of Surrey, who are sure to rally round us when suitably and opportunely invited, requesting me to reconsider the matter, I will gladly invite a conference with them and weigh with sincere respect their reasons for demurring to a further delay. In the meantime do not suffer the fabric to be neglected, and do not fear that this postponement need be either final or indefinite. The church must clearly be put into repair at once. As patron I readily offer you 50*l.*, half of which I send you now, and the other half you shall have next year. What I feel even more anxious about—you will feel equally so—is that even common structural repairs should be entrusted to a first-rate architect whose skill and experience will command public respect, and who is not likely to mar a future and beautiful restoration by any clumsy tinkering now. One ground of hope I lightly touched on in our interview; I can only hint at it here. It is still in the future, but it is simply a question of time. Sooner or later the beautiful and opulent county of Surrey must be made a separate diocese, with the ample resources of its gentry and men of business to back South London with its million of souls. Then the bishop of the new see, whoever he may be, will find a quick and ample response to his plea for the restoration of his South London cathedral, and the spiritual appeal, combined with the æsthetic, will be found irresistible.—Your faithful servant, A. W. Roffen."

EXPLORATION IN CYPRUS.

A COMMUNICATION from M. Ohnefalsch Richter, Consulting Archæologist of the Cyprus Museum, appears in the last number of the *Philologische Wochenschrift*. In the course of it he says:—

As so much has been written of late on the hopelessly dead-alive condition of archæological research in this island, and on the wretched condition of the Cyprus Museum, it may not be out of place, in the interest of science and for the benefit of cultivated people in general, to give the views of the new Governor (Sir Henry Bulwer). It is all the more incumbent on me to do this, since my most recent discoveries have overthrown almost all our previous ideas about Cyprus, and since masses of archæological treasure lie buried in the island which are of the utmost importance for the earliest Greek art. I have proved this by excavations carried on during five months and a half. The results are astounding. One need only scratch the ground to come upon the most precious treasures. The new Governor, Sir Henry Bulwer, is desirous of scientific results. He wishes the excavations to be carried on only on the most approved scientific methods. He wishes the excavations to be utilised to the uttermost, so as to obtain some conclusive knowledge about the history, arts, and civilisation of the country, and thus to promote the knowledge of antiquity. "Only if we proceed in this manner," said he, "only if we add to the sum of knowledge, can we claim a right to disturb the cities of the dead. Antiquarian research, archæological excavations, do not exist to fill the purses of greedy speculators. Excavations should not be an affair of money making." Sir Henry Bulwer further expressed himself to the effect that should a scientific institution, a real museum, or a Government—no matter of what country—set on foot antiquarian researches in Cyprus, he would cordially welcome it. Although he should like England and the British Museum to take the lead, his feelings in the main were international. He desired the advance of science, no matter whether it came from London or Paris or Berlin, or any other place. He would do whatever lay in his power to gain for such a scientific undertaking every possible help from the English Government. Like Sir Henry Bulwer, his private secretary, Major J. Chamberlain, is a cultivated man. He knows ancient Greek, and reads German books. I had a further talk with Major Chamberlain about the question of a museum on the spot, and found in him too an unbiassed and generous turn of mind, based on ideas above the common, which, I own, surprised me, for in most of the high English officials of the island—Sir Robert Biddulph first and foremost—I had hitherto only found the ideas of a shopkeeper (*Krämerideen*). Major Chamberlain said to me:—"What a difference there is between going into a great museum and seeing a jumble of objects collected from every country under the sun, and visiting a local museum such as those at Olympia or Pompeii, Trèves or Nismes, where each object points to the history, the period, and the stage of civilisation of the very place where I am standing. Without wishing to depreciate our great museums, I am for local ones, and I think that our Governor-General is of my way of thinking." When I proceeded to conduct Sir Henry Bulwer through my storehouses, crammed with antiquities, he always lingered by preference beside those objects which I could point out as local Cypriot work. He could have as much as he wanted of the objects imported from Greece in the great museums. "The people who lie buried here, the ancient Cypriotes their habits and customs, their civilisation, their art, and their religions—we must make it our main object to study all these from the remains," he would say. "It is quite otherwise with Greek importations. But a vase such as that with the seated figure of the ugly Phœnician-like woman and the birds painted on it interests me more, because it is something new, because it is something which enlightens and instructs me about ancient Cyprus and the ancient Cypriotes." All honour to such a Governor-General! Hurrah for the excavations in Cyprus! When I was at work in 1882 for Mr. C. T. Newton, then Director of the British Museum, I called on Sir Robert Biddulph, who was then Governor-General. He desired to be informed about the results of my excavations, and I proceeded to describe them to him according to their scientific value, beginning with the terra-cotta figures. He interrupted me half angrily, "Not that; but have you found any gold?" I then began to describe the gold ornaments. But again His Excellency

interrupted me still more impatiently, "Not that; but were they heavy?" and he moved his hands in imitation of a pair of scales. The gold ornaments not being heavy, His Excellency speedily lost his interest in the antiquities of Cyprus. The island and its museum, as well as archæological science, will find a powerful friend in the new Governor-General.

ARCHÆOLOGY.

Roman Remains near Pau.—Some Roman remains have recently been discovered at Lescar, near Pau, and the Council-General of the department has voted a subsidy to the Society of Arts and Sciences at Pau to enable it to continue the researches. Private subscriptions have also come in very abundantly, and the work of excavation is going on apace. The ruins in question are situated upon a plateau overlooking the mountain stream known as the Gave de Pau, and they are separated by a ravine from another plateau upon which the site of a Roman camp was discovered. They appear to be the ruins of a regular palace which must have been the residence of the military chief in command of the country. A Roman road passed close to it. The excavations have gone far enough to bring to light a large hemicycle about 65 feet in diameter, paved with mosaic, a pentastyle also paved with mosaic, bath-rooms, and rooms for slaves. These ruins, all of which belong to the same edifice, are supposed to belong to the third century of our era, judging by the only discovery which gives any indication as to date—that of a medal of Gordianus III. The most interesting feature about these excavations is the large number of mosaics discovered. Some trenches sunk in the immediate vicinity of the palace first discovered, and upon the same plateau, have led to the discovery of many important substructures, and the general opinion is that the remains are those of the ancient town of Beneharnum, which was completely destroyed and razed to the ground at the time of the Norman invasion.

CHURCH BUILDING AND RESTORATION.

Blundellsands.—A new Roman Catholic church, dedicated to St. Joseph, has been opened. The style is Early English. Mr. A. E. Purdie, of London, is the architect, and the building operations have been carried out by Mr. Samuel Webster, of Bootle.

East Leake.—St. Mary's Church has been reopened after undergoing works of restoration. The architect was Mr. Weatherby, of London, and the contractor Mr. William Belton, of East Leake. The chancel stalls are of English oak, of a plain but dignified character. The estimate of the total cost of restoration was 1,200*l.*

St. Bartholomew the Great.—On Tuesday this church was reopened in the presence of the Lord Mayor, after restoration under the direction of Mr. Aston Webb. The external encroachment at the east end, which projected nearly 20 feet, is removed, and a new apse has been constructed. These were undertaken at the sole cost of the Rev. F. Parr Phillips, the patron. The church has also been entirely re-roofed, and various other works have been undertaken. During the progress of the work of restoration, much of interest has been brought to light. On taking down the square wall carried by the girder and columns at the east end, the upper portion was found to be built of the tracery of what was no doubt the great window of the fourteenth-century square east end, and enough of this has been found to show its design. The opening out of the entrance to the lady chapel is of considerable interest, and displays features hitherto entirely concealed. The work has been carried out without the removal of a single worked stone from its original position. The works that are still urgently needed are the removal of a forge and parish house on the west transept; also the present vestry in the south transept, and the boys' schoolroom from the triforium; and the building of two shallow transepts to support the arches of the crossing, the uncovering of the nave, and the restoration of the lady chapel.

Southborne-on-Sea.—St. Catherine Church, at Southborne-on-Sea, is the first place of worship erected in this rising suburb of Bournemouth. It has been designed by Mr. A. Burt, architect, of East Dulwich. At present only a part of the church is erected, but when completed will have cost about 10,000*l.*

NEW BUILDINGS.

Beverley.—The Corn Exchange and Public Baths newly erected at Beverley have been opened. The buildings have been erected at a cost of about 2,500*l.*, in a type of architecture prevailing in the latter part of the seventeenth and the beginning of the eighteenth centuries. The works have been carried out by Messrs. Pape Brothers, of Beverley, and Messrs. Bradford & Co., of Manchester, from the designs and under the superintendence of Mr. S. Musgrave, F.R.I.B.A., of Trinity House Lane, Hull.

Fordingbridge.—New workhouse buildings have been opened for the Guardians of Fordingbridge Union. Special care has been bestowed upon the sanitary arrangements throughout, and the drainage is so arranged that almost any length of drain may be inspected at a moment's notice by means of lamps and manholes, placed in suitable positions, with lidded pipes (to allow for a removal of a stoppage without breaking the pipes). Bowes, Scott, and Read's patent automatic flushing tanks are used for flushing purposes. Externally the buildings present a warm and pleasing appearance, being erected with local red bricks, relieved only by moulded cornices, strings, labels, aprons, &c., of the same colour. The style is Queen Anne in character, plainly treated, the good appearance being almost entirely obtained by careful proportion and grouping. The works have been satisfactorily carried out by Mr. John Greenwood, of Mansfield, Notts, from the designs and under the personal superintendence of Mr. Fred. Bath, A.R.I.B.A. and F.S.I., of Crown Chambers, Salisbury. Mr. Edwin Radford acted as clerk of works, and Mr. Robert Orchardson was the contractor's resident agent.

Wigan.—The new Royal Court Theatre, Wigan, erected by Messrs. Worswick & Gee, has been opened. The building, which has been designed by Mr. R. T. Johnson, architect, Wigan, is capable of seating 3,000 persons.

SCHOOL BUILDINGS.

Chelmsford.—The British Schools have been reopened after being rebuilt and extended. The contract for the erection of the new buildings was taken by Messrs. Choat & Saltmarsh, Mr. Charles Pertwee, of Chelmsford, being the architect. The work has been carried out by the contractors in conjunction with Messrs. Parkhurst, Wray, Beckett, and others, at a cost of about 2,000*l.*

GENERAL.

The Annual Dinner of former architectural students of the Ecole des Beaux-Arts will be held on Monday next, under the presidency of M. Questel. The tickets are sixteen francs each.

Mr. Tom Lloyd was on Wednesday elected a member of the Royal Society of Painters in Water-Colours. Sir Frederick Burton, director of the National Gallery, and Mr. E. Burne-Jones, A.R.A., have rejoined the Society, the former as an honorary member.

Mr. Ewan Christian has written to Mr. Clarke Aspinall stating that he hopes, within the next few days, to send in his report upon the three designs for the Liverpool Cathedral. When the report comes to hand the executive committee will be called together.

The Late Thomas Webster, R.A., has bequeathed the portraits of his father and mother, painted by himself, to the National Gallery; his own portrait, painted by himself, to his wife; the remainder of his pictures are directed to be sold, and the proceeds added to his residuary personal estate. After his wife's death 2,000*l.* is to be given to the Cranbrook Grammar School in order to found two exhibitions at Cambridge.

Sir Baldwin Leighton, in delivering the prizes at the Shrewsbury School of Science and Art, spoke of the position of architecture in the country as follows:—"I will not say that there is no room for improvement, for I know something specially of that art, as I have designed and built myself; but I will say this, that the veriest tyro in the profession seems to have more of the right spirit in him now than thirty years ago the leading men possessed."

A Course of Lectures on Photography for architects is now in course of delivery at the York Architectural Association.

The St. Pancras Board of Guardians have decided that their architect, Mr. H. H. Bridgman, should be instructed to prepare and submit to the Board by February 1 next plans and specifications for additional and improved workhouse accommodation, at an expenditure of 50,000*l.*, or such further sum as the Guardians might ultimately decide upon.

The Electric Light is being adopted for the carriages of the Glasgow Underground Railway.

A Conversazione of the London and Middlesex and Surrey Archæological Societies will be held on Wednesday next in the hall of the Merchant Taylors' Company, Threadneedle Street.

The Architect.

THE WEEK.

The Saint Gobain Glassworks have secured the order for 100,000 mètres of glass for the roofs of the Paris International Exhibition of 1889. The quantity used on the Great Exhibition of 1851 in Hyde Park was 900,000 superficial feet.

The new Guildhall School of Music, which Sir Horace Jones designed, was opened on Thursday. Few institutions have had so much success in a few years. It was as late as 1879 that an orchestral society was founded in the City, and permission was given to hold the meetings in the Guildhall. It was afterwards recommended that the Corporation should assume the control of the society. The next step was the establishment of a school with an allowance of 350*l.* a year, the use of a few classrooms in Aldermanbury being likewise given. The school started in September 1880, with 62 pupils, but at the end of December there were 216 pupils and 29 professors. In April the members had increased to 445 and 45 respectively. The Court soon agreed to grant 200*l.* a year for necessitous and deserving students. At the end of 1881 there were 907 pupils and 58 professors, and the next year the number of pupils rose to 1,130. The grant from the Common Council was, in 1882, increased from 350*l.* to 1,600*l.* a year, additional classrooms were provided, and various exhibitions were given. The students continued to increase, and at the beginning of 1885 there were 2,413, with a staff of 85 professors. It was then seen that new premises must be obtained for the school, and it was agreed to take the site on the Embankment at a rent of 1,100*l.* a year, and to expend 20,000*l.* on a building, which sum had to be increased owing to the nature of the foundations and the substitution of Portland for Bath stone. A further sum of 3,000*l.* was afterwards given for furniture and fittings. The new school starts with 2,503 students and 90 professors, including many who have gained positions in London. In the five years since the school was opened the fees paid have exceeded 80,000*l.*

The Metropolitan Board of Works has resolved to widen the class of candidates from whom a candidate for the position of Superintending Architect is to be selected. There is no longer a limitation to age, and the salary is to be 1,500*l.* a year. This time there ought to be no grounds for saying that eligible candidates were not forthcoming. Unless they are withdrawn, the former applications will be again considered along with those which will be received under the new conditions. We have already indicated the currents of thought among the Board in respect of the appointment, and if so much diversity continues it will be difficult to come to a conclusion. Architects who are fully competent applied in response to the invitation, and many more will now compete. Since among them will be several who can insure the respect of the architects and builders in the Metropolis, we trust no more delays will arise from projects of a transformation of the architectural department.

The Institute of France lost its oldest member by the death of M. Natalis de Wailly. He was elected in 1840. At the time of his death he had reached his eighty-second year. M. de Wailly was for long the Conservator of Manuscripts in the Bibliothèque Nationale, and he wrote several essays on subjects connected with palæography. He rendered one important service when he brought out an edition of "The Life of St. Louis," by the Sire de Joinville, the faithful Sénéchal de Champagne, who had been the companion of the King. The book was often talked about, but was read only by a few enthusiastic scholars who found a charm in the antique language. It was, however, well adapted to be a popular book, as it is a picture of life in the thirteenth century, and it has, moreover, the character of being true. Every line, however, offers a difficulty to any Frenchman whose reading is confined to modern works. M. de Wailly took up Joinville's book and removed all the difficulties. He treated the author in the most reverential manner, and his principal alteration is in the transforming the ancient orthography. It was not without reason that the editor was convinced of the fascination of his work for a generation that was acquainted with Dumas. The drama of the Crusaders, as it was pictured by Joinville, is more moving than a romance, and can henceforth be generally enjoyed through the happy thought of M. de Wailly. That, however, was only one of his services in making mediæval literature more familiar to his contemporaries.

The Birmingham Corporation have had the good sense to acknowledge the obligation of the town to Mr. Watts, R.A., for lending his eighty-one pictures for exhibition, and it is admitted that such an attraction largely contributed to the success that attended the New Art Gallery. So far the councillors are right. But is the gratitude to be expressed only in words? Why is not a commission for a painting given to Mr. Watts? If the Corporation cannot do so, there are at least members and ex-members who are able to display some liberality of that kind. As it is the gratitude is suggestive of the Frenchman's definition of the virtue, viz., "une forte et secrète envie de recevoir de plus grands bienfaits."

The resistance to the proposed Edinburgh Municipal Buildings is growing in strength. The meetings in the wards are decidedly unfavourable to the scheme, and if money is subscribed to pay the expenses of an opposition in the Houses of Parliament, the Bill stands a chance of rejection. It is now evident that no more than a part of the Municipal Council is eager to have new buildings, and the proposal appears to be rather premature. The city already owes over half a million, and the buildings would increase the amount by a quarter of a million, which means an additional rate of 3*d.* in the pound. The *Scotsman*, while heartily approving of the idea, and of the site that is selected, believes that the time for beginning new Municipal Buildings will be when the Town Council has, by strict economy, abolished its floating debt, put its everyday work —like the markets—in good order, and comes to the consideration of the question of a noble house for itself unencumbered by responsibility for numberless other schemes. The contest, we suppose, affords excitement in Edinburgh during a dull season, but no one appears to give a thought to the competitors who are working on so shadowy a foundation.

Mr. F. C. Penrose's name is not associated with exploration in Greece, although his discoveries respecting the curvature of lines in temples have gained him an enduring reputation. He has now taken charge of the British School of Archæology in Athens, and it is gratifying to learn that Mr. Penrose will be able to give the students opportunities for experiments in exploration that will be similar to those possessed by the French and Germans. The Temple of Jupiter Olympus was selected for the work, and the Greek Minister of Public Instruction has given the requisite permission to Mr. Penrose. The operations will be watched with interest.

The Society for the Protection of Ancient Buildings has taken up the cause of the parishioners who are protesting against the alterations in the chancel of Bearsted Church, which have received the support of the Ecclesiastical Commissioners. It will be remembered that it is proposed to form an organ chamber, and to gain space some pews and a piscina will be removed. The secretary of the Society says:—"The south wall of the chancel is generally the most interesting wall of a church, for it is there that the piscina and sedilia are in most cases to be found. They are the most important ritual features remaining in our ancient churches, and are of great importance also in determining the date of the foundation. It is hard to imagine a case which would justify the mutilation of the south wall of an ancient chancel, and most certainly the desire for a recess in which to place an organ is not a sufficient justification. The modern fashion for building such places is almost certain to be regretted in times to come. They are about the worst places which could be devised from the organ builders' point of view, and they are always disfigurements of an old church." The case is at present under consideration.

SCOTTISH CASTLES.*

SCOTLAND holds a position in the affections of the world which may be envied by all other countries with the exception of Greece. History and romance have made it in a great measure an ideal region, nature has endowed it with a beauty that corresponds with that ideal, and its sons have wandered so far as to create an interest of a different kind, from China to Peru, in the land from whence they came. In this way Scotland has gained an influence which the critical traveller is compelled to respect. Burns in his mirthful mood might warn his countrymen that Captain Grose, the antiquarian, was going about taking notes which were to be printed; but since that time many things have occurred to make the note-taker's work valueless unless he is disposed to praise everything he sees.

Associations of various kinds have thrown a glamour over the greater part of the Scottish land, and of course the buildings were not excluded. It is difficult to judge of what remains of the ancient architecture with impartial eyes. The humblest cockney who is able to undertake a cheap trip to Edinburgh comes back with the belief that Holyrood is impressive, and that the gallery, with its imaginary portraits of kings, surpasses what is to be seen in the South, although he cannot explain why he should think so. Let an archæologist who is disposed to be critical over little details of English art take a run through Scotland, and he also is sure to return a devotee. Even Mr. Ruskin, who may be said to have all the privileges of a chartered censor, was forced to be qualificative when he spoke of Scottish things. He could not help abusing the New Town of Edinburgh, which is a sort of Pimlico in stone, and he called it a wilderness of square-cut stone which was a grave of the soul, but that condemnation was followed by the declaration that the streets surpassed those of other cities in their manliness and effect. And the tourist, however wrathful he may be against the hotel-keepers of the city, will in the same way bow before the *genius loci*, and exonerate it from all responsibility for excessive charges and insufficient accommodation.

It is probably through fear that the associations on which the interest of Scottish buildings depends to a great extent cannot be imbued in any minds but those of natives, that so many archæologists and architects in Scotland have a dislike to see native architecture described by English pens. One of the best known of the old school of Scottish architects once said to the writer that "no Englishman could understand the plan of a Scottish castle," and although there is exaggeration in the words it suggests what is thought in the North about the peculiarities of the buildings. A sort of training has to be gone through, in an unconscious way, in order to appreciate the castles and churches, and it may only be attainable by those who are fortunate in beginning their architectural studies north of the Tweed. The late Mr. Fergusson might be supposed to have some claim, on family grounds, to be considered competent to judge of buildings in the North. But he is rejected because, as we are told, he did not regard the houses as forming "an important element in the general history of the art."

Englishmen would be very glad to leave the treatment of Scottish architecture to Scotsmen, for when they attempt the task it is owing to the absence of books on the subject by native writers. Accordingly we anticipate that the new volume on "The Castellated and Domestic Architecture of Scotland" will find a welcome in England. The work merits recognition, for even a cursory glance will suggest that it must have taken a very long time to prepare. When it is said that there are nearly five hundred illustrations, consisting of views, plans, sections, and details, it will be evident to the initiated that neither time nor money was spared in the production. The book has, moreover, the advantage of aiming at a definite conclusion. It is not a collection of descriptions of picturesque buildings, more or less related by the accident of position or resemblance, but a book which expounds a theory. The authors say their aim is "To trace the historical sequence of the various phases of architecture which have prevailed in the old castles and houses of Scotland, and to try to define and explain the different styles of building adopted at different periods, from the twelfth century till the revival of Classical architecture in modern times." Only a part of the programme can be realised in the first volume, but what is attempted is so well accomplished, that there can be no doubt of the ultimate success of the authors. The assistance which was received from architects and archæologists suggests that in Scotland the work was considered to be deserving of encouragement.

A subject like Domestic Architecture is very intimately connected with social history, and one cannot be understood without the other. What kind of architectural buildings would be deemed necessary in the Scotland of the twelfth century in order to satisfy the conditions of life at the time? Apparently the tribal spirit was in force, and an immense tract of land was not supposed to be the property of a single individual. The chiefs were powerful, but they were obliged to recognise the rights of the people around them. We know that in the eleventh century, emigrants from the South entered Scotland and were allowed to settle there. They had, however, to recognise the local conditions. Thierry (and on such a subject he deserves to be considered impartial) tells us that the cabins which the emigrant nobles built for dependants were enclosed by a fence or wall, the noble's castle being in the midst, as in England, but while in England the cabins were occupied by serfs, in the North there was no servitude. Now it is remarkable that although there seemed to be so much dissimilarity between the conditions of Scotland and England the earliest Scottish castles are on the model of those which the Normans constructed in England. There were "brochs" of an early date, and they are not suggestive of a provision for the security of any individual chief and his family, but that form of structure seems to have exercised no influence upon the later castles. Messrs. Macgibbon and Ross state that "The rectangular keeps of the Normans have formed the model after which most of our Scotch castles have been constructed." Their work accordingly begins with an investigation of the arrangements of the keeps as they are shown by examples in France and England.

It is no longer possible to determine what kind of castle was erected in the twelfth century in Scotland, but enough remains of those belonging to the following century to suggest their character, which is thus described :—

> The general idea of these thirteenth-century Scottish castles is that of a large fortified enclosure. The plan is usually quadrilateral, but more or less irregular, so as to suit the site. There are, however, some striking exceptions to this rule, as, for instance, the Castle of Rothesay, the plan of which is oval, and Caerlaverock Castle, which is triangular. The curtain walls are about 7 to 9 feet in thickness by 20 to 30 feet high. The angles are frequently provided with round or square towers, and no doubt these and the curtains had parapets with embrasures for defence, and rampart walks all round the walls. But these have now in almost every instance disappeared. The entrance gateway was always wide, and seems to have been generally provided with a portcullis. There is sometimes also a postern door. It is impossible to say what the arrangement of the buildings within the enclosing wall may have been. The angle towers seem to have been used as the dwellings of the garrison, as they are frequently provided with *garde-robes* in the thickness of the wall, but there were probably other buildings within the enclosure with roofs leaning against the curtains. At Rothesay a large chapel still survives, while at Lochindorb a ruinous building is still called the chapel, and it is very probable that other castles contained a similar edifice. The sites selected for this class of castle varied greatly. They are, however, generally built on rather low-lying ground, and trust more to water than to lofty sites for their security. . . . They are, for the most part, rude imitations of the thirteenth-century castles of France, or the Edwardian castles of England; but some of the finer examples, such as Bothwell, Kildrummie, and Dirleton, present a wonderfully close resemblance both in design and workmanship to the more splendid military buildings of the South. These have all the characteristics of the French castles of the thirteenth century.

The authors describe the examples which remain of each period, and as they are careful to give plans their book is far more valuable to the student than those which depend on picturesque views. Most of the castles are seen to be quadrilateral, but Rothesay might be called an oval circle,

* *The Castellated and Domestic Architecture of Scotland from the Twelfth to the Eighteenth Century.* By David Macgibbon and Thomas Ross, Architects. Vol. I. Edinburgh: David Douglas.

and Dunstaffnage, which holds a splendid position near Oban, is irregular in order to correspond with the site. The ground enclosed by the walls of these strongholds was often very large. Bothwell measures 325 feet by 140 feet, and apparently it bore some resemblance to the great Château de Coucy. It, moreover, indicates a change in manners, for there are halls and residences around the enceinte which owe their origin to the desire to have more state and, it may be, more privacy at times. Caerlaverock, although included among the buildings of the first period, has work of no less than six periods, and part dates from the seventeenth century, when Renaissance details were in favour.

The second period is that between 1300 and 1400. It was not a castle-building century. From 1306 until 1329 there were the wars between BRUCE and EDWARD. It was part of the tactics of the Scottish king to wear out his enemies by avoiding pitched battles and leading them into places where they could be cut off in detail. Castles would be of little use under the circumstances, and the only one that is associated with BRUCE'S name is Tarbert, which from its position was useful against the Highlanders, who might attack him in his rear. For sixty years after the death of BRUCE the country was a prey to faction, and the son and successor of the hero became a traitor. There were constant invasions by England, which received the assistance of several of the most powerful of the Scottish nobles. It was not until 1424, when JAMES I. returned from his English prison, that there was an approach towards a cessation of the anarchy, amidst which, however, the country contrived to preserve its independence. Under such circumstances architecture was not likely to flourish: all that was required in a castle "was a stronghold sufficient to accommodate the owner's family and personal retainers, and to protect them from sudden attack." Square towers or keeps of plain form were therefore generally adopted, but in subsequent periods various buildings were constructed about them. The upper part of a keep was necessarily of much importance, and the platforms and bartizans led the way to the elaborate cornices and corbelling seen in later works of the North. One remarkable example of the second period is Crichton Castle, which Sir WALTER SCOTT introduced into "Marmion." His description will suggest the growth of buildings of the class:—

> The oldest part of the building is a narrow keep or tower such as formed the mansion of a lesser Scottish baron; but so many additions have been made to it that there is now a large courtyard surrounded by buildings of various ages. The eastern front of the court is raised above a portico and decorated with entablatures bearing anchors. All the stones of the front are cut into diamond facets, the angular projections of which have an uncommonly rich appearance.

The third period of the Castellated and Domestic Architecture of Scotland ranges between 1400 and 1542, and is of great importance. The keep was sometimes preserved, but it was made longer in extent, and assumed a kind of independence. The remaining buildings were grouped around a courtyard. When it is found that about fourteen hundred castles were erected on the courtyard plan, and that among them were such castles as those of Edinburgh, Stirling, Linlithgow, Tantallon, Rosslyn, Doune, and Dunnottar, it will not be thought surprising that more than one-half the volume is occupied with the period. The authors divide the buildings into (1) simple keeps, (2) keeps with one or two wings, (3) keeps enlarged in various ways by additions.

Newark's "stately tower," on which the Last Minstrel gazed with wistful eye, belongs to the first class. It must always be memorable, for, from its introduction in the first page of SCOTT'S "Lay," it was the means of creating an interest in Scottish architecture. The castle measures 65 feet by 40 feet, the walls are 10 feet thick, and it had four storeys with wooden floors, besides a vaulted basement. Branksome Tower, which holds so important a place in the "Lay," was commenced in 1571, and therefore is of a later period.

There are greater works of architecture than the Scottish castles of this third period, but we doubt if many are more impressive. The effect made by the castles of Edinburgh and Stirling, when they are first seen, can never be effaced; but the simplest keep that rises abruptly in a flat country or in an island of a lake has something about it which keeps a hold on the memory. This is the more remarkable since so little in the exterior of any of the buildings was introduced for the sake of effect. Everything had its use. There is, however, much in all the buildings which is worth attention simply for its intrinsic merit, although hitherto less is known about that kind of work than it merits. The great advantage of the book by Messrs. MACGIBBON and ROSS is that it is written in the first place for architects, and in consequence they are not afraid to treat of details. It will be prized beyond more expensive books on the subject, and deserves to be known wherever Scotsmen are to be found.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE third ordinary meeting of the Institute was held on Monday evening, Mr. E. I'Anson, president, in the chair.

A paper, written by Signor G. Boni, hon. corr. member, in English, on "The Golden House," Venice, was read by Mr. George Aitchison, A.R.A. The paper was illustrated with original drawings, one of which was prepared by Signor Boni expressly for the occasion. The following is an abstract of the paper:—

The Ca' d'Oro, Venice, and its External Colour.

Two years ago, Signor Boni said, he had taken advantage of the scaffolding erected to carry out repairs to examine the front façade of the Ca' d'Oro. His examination of the front convinced him that the battlements were original, and that a cornice originally existed along the whole front. This cornice consisted of a rope moulding supported on a trefoiled arcade springing from corbels; each arch curving outwards so as to form a series of niches on plan, and at the bottom of each arch was a rosette. Some of the corbels and remains of arches still exist on the front, while on the return in the alley there is one perfect arch and one half-arch, but the rosettes have perished. The whole treatment shows that the front was coeval with the piazzetta front of the Ducal Palace, in spite of older work being built into the front of the Ca' d'Oro.

Signor B. Cecchetti, the Keeper of the State Records, had found the memoranda and contracts made between John Bon (the architect of the Porta della Carta of the Ducal Palace) and Marino Contarini (the procurator and owner of the Ca' d'Oro) for building it, beginning from the year 1424. The sum of 160 golden ducats was to be paid to J. Bon for a year of his own work, of his sons, and of his two assistants, Zane and Rosso. The work was undertaken by the owner, who paid the masons. Extracts from the specification of April 20, 1430, relating to the cornice and battlements, were given in the original Venetian dialect, and some of the technical words were explained. The contract with J. Bon was for 210 golden ducats. The Venetian ducat, between 1425 and 1443, is stated to have equalled 12·012 frs. John Bon is called in these documents, as well as in the contract for the Porta della Carta, "Stonecutter."

The specification minutely describes the manner of construction, the quality and size of the materials, and the quantity of work to be done, and was accompanied by drawings (now lost). When the stonework was done a new contract was entered into for the painting in oil and gilding of certain parts of the work, dated September 1531. In it J. Bon is called "Master John of France, painter of St. Apollinaris." The specification states the colours to be used, the number of coats, the parts to be gilt, and that the ultramarine was to be fine, and of the value of 18 ducats a pound. J. Bon was to have 60 golden ducats for this work; by a receipt of June 30, 1432, Contarini appears to have paid for the gold leaf. The parts to be gilt were as follows:—The balls of the battlements, the necking under the fleur-de-lys, the rosettes under the arches, the foliage of the two large capitals, the two lions and the fields of the shields between their paws, and the edges of the mouldings of the tablets over the caps on which they stand, the ducats on the rope moulding, twenty rope mouldings round the circular panels of porphyry, &c., and the balls in the centres of these. The shield on the second floor, the dentil band round the panel, and the foliage within it. The ground of the large caps was to be ultramarine, and so were the bands on the shield the lions hold; the underside of the tablets on which the lions stand was to be of ultramarine with gold stars, the bands on the shield of the second floor were to have two coats of ultramarine. The cornice, the arcade under it with the cusps, were to be painted in white lead and oil, the battlements to be marbled and to have a black line inside the edges if it looked well. The triangular space between the cusps were to be touched with black. All the red marble of the front and the red marble dentil bands were to be rubbed with coloured oil and varnish, so that they look red. All the

roses and vines of the front were to be painted in white lead and oil, and the backgrounds painted with black oil paint, so that they look well. All the background of the foliage of the ground-floor cornice, with its return on the flanks, to be tarred with black oil colour, and the four sills in the alley. The red marble of the Ducal Palace still shows traces of having once been painted red. Signor Boni then referred to ultramarine, and alluded to a Greek inscription of the expense of building the Erechtheum, found at the Propylea at Athens in 1836, a part of which stated that two gold leaves had been bought of Adonis at Mileto to gild the eyes of the column, and Signor Boni finished by saying:—"The Athenian inscription and the Venetian document are the best inscribed records we possess to prove that gold, the richest and most beautiful among temporary means for supplying a new building with colour, was used during the best periods both of Grecian and of Mediæval art."

Mr. J. D. CRACE, in response to the President's invitation, rose, but said he had not come prepared to speak. It was interesting to note the application of colour to the Ca' d'Oro as confirmatory of the origin of the name, and also in connection with the effect intended to be produced by it. The parts gilded were selected with particularly good judgment, and the result must have been most successful. Points of gold led up to and introduced sunshine into the leading parts of the building. The black lines seem to have been introduced as frames for the plain surfaces, where there were no deep shadows, as in the loggie part; they served the purpose of cutting up the shadowless surface, and were useful in maintaining the balance of the composition. Mr. Crace, in conclusion, proposed a vote of thanks to Signor Boni for his paper, and to Mr. Aitchison for reading it.

Mr. JOHN SLATER seconded the proposal. He remarked that few had had the opportunity of noticing the colour decoration of the Ca' d'Oro, and so it would be impossible to discuss that point. When in Venice four years ago he had not satisfied himself why the building was called the Ca' d'Oro. As to the mere architecture of the building, that could not fail to strike the observer. It was one of the most remarkable buildings in Venice. Among other matters, Mr. Slater inferred from the rope moulding that a street must have run on both sides of the building, and in conclusion spoke of the zeal with which Continental scientists investigated any subject they took up.

Mr. T. BLASHILL said that the Ca' d'Oro was like many other buildings in Italy, in not being a completed design, and the existing wing of the Ca' d'Oro suggested a wing which ought to be on the left side to form a complete composition.

Mr. JOHN HEBB, in the course of his remarks, expressed the hope that no unsatisfactory restorations like those at St. Mark's would be attempted at the Ca' d'Oro.

The vote of thanks to Signor Boni and Mr. Aitchison was put by the President, and carried by acclamation.

Mr. AITCHISON acknowledged the compliment, and concluded his remarks by reiterating what M. Paul Sédille had said—that if we wanted colour in our buildings here it must be got by using imperishable substances, such as granites, porphyries, terra-cotta, and glazed mosaic, which alone could stand our climate.

THE MANCHESTER ART MUSEUM.

AN experiment was lately made in Ancoats, Manchester, to open an inexpensive museum that might serve for some other purpose than the gratification of sightseers, and which might be made instructive for humble folks by the aid of honorary teachers. Mr. T. C. Horsfall, the treasurer and one of the founders, has given the following account of the working of the museum, which may be of use to those who wish to establish similar museums elsewhere:—Its rooms contain copies of those drawings on stones which are amongst the earliest records of prehistoric art in Europe; copies of Egyptian paintings, of pictures in Rome and Pompeii before the traditions of Greek painting were broken, of pictures showing the influence of the Byzantine school; a large collection of copies of pictures showing the development of painting in Italy from the time of Giotto to that of Paul Veronese; copies also of pictures of sacred subjects by German and Flemish painters, and a group of copies of similar pictures by modern painters; landscapes, including a considerable group of representations of beautiful places near Manchester, which it is hoped will induce some Manchester people to go to see the places; part of a fine set of plates of Turner's "Liber Studiorum," with etchings and fac-similes of etchings for the plates, and the Rev. Stopford Brooke's admirable notes on the plates; a group of pictures of war subjects; a group of pictures of sea subjects; a group of pictures of incidents in history and great fiction; pictures of the toils, pleasures, and sufferings of human life; pictures and copies of pictures of fine imaginative art; copies of Turner drawings by Mr. Ward, two of them finished by Mr. Ruskin, and nearly all provided with notes by Mr. Ruskin; a large series of photographs showing the development of architecture and sculpture in Egypt, Greece, and Italy; Hoelzel's fine series of geographical pictures, showing twenty-eight remarkable scenes in different parts of the world, from the Arctic zone to the Cape of Good Hope; Langl's pictures of architecture in Egypt, Assyria, Persia, India, Greece, Rome, and Mediæval Europe; Roberts's pictures of the Holy Land; a large collection of engraved and etched portraits of famous personages; pictures of common kinds of English trees as seen in summer and winter; of their large branches, twigs and leaves; of common wild and garden flowers, common English birds, humming-birds and wild animals, and of the beautiful use of plant and animal form in decorative work; a room full of pictures likely to interest children and their mothers; pictures of beautiful textile fabrics, vases, metal work, &c.; printed explanations of wood engraving, line engraving, etching, lithography, &c.; the tools, plates, &c., used in these processes, and pictures showing the gradual development of the processes; a small collection of Greek vases, and copies of Greek bronzes and coins; collections of Indian pottery and glass, of cheap European pottery, good in shape and colour, of beautiful textile fabrics, of wood carvings; a collection of Egyptian and Greek antiquities lent by Mr. Flinders Petrie, and one of Japanese swordguards lent by Mr. Ernest Hart; casts of Greek and Assyrian sculpture, including many slabs of the Parthenon frieze, with carefully compiled notes on each. One room is fitted up as a model artisan's dwelling—living room and bedroom; another is reserved for classes. In it we have begun to hold a free wood-carving class on two evenings each week and a free drawing class on one evening. An adjoining room, which holds about seventy people, is used as a lecture-room. In it Mr. Sowerbutts has kindly given two lectures on physical geography, and Mr. J. E. Phythian has lectured twice on the history of architecture and has several times read Andersen's and Grimm's fairy tales to crowded audiences of children. Mr. Gustav Behrens has given us a grand piano, which is placed in the largest room, and this has enabled the Rev. S. Farrington and some of his friends to give the first of what we hope to be a continuous series of entertainments (music instrumental and vocal, recitations, and short lectures), to be given twice a week.

Though nearly all our pictures are provided with very legible explanations, we find, as we expected to find, that few workpeople pay attention to any but those which clearly tell stories. The inhabitants of English towns know so little of beautiful country things, beautiful scenery and beautiful art, and of the history of other peoples, that they cannot be expected to look with interest at pictures representing such things. On the other hand, we find, as we knew we should, that all our pictures are made interesting to workpeople by any one who, feeling the interest of the pictures, talks about them in simple language. More explainers of pictures is one of our wants—persons who will make the pictures starting points of talk about art, history, physical geography, architecture, botany, or any other subject. There is room in the museum for twenty or thirty persons to work in this way at one time. Nothing is easier or pleasanter than such work. One says a few words to a child about the picture it is looking at, and half a dozen people at once collect to be talked to. We also want the help of persons who play and sing, read and write well, of those who will give short addresses on any wholesomely interesting subject. We should be glad to find volunteer teachers of wood-carving, drawing, metal work, or any other art, to give classes on the three nights each week on which the classroom is now unused.

All this work in which we seek fellow-workers is amongst the best work doing of our day. The evils which are ruining the bodies and minds of so large a part of the people of our towns cannot be checked except by the provision of better modes of spending leisure, for which interest in the beauty of nature and art is a pre-requisite, and interest in such beauty is equally necessary as a foundation of that skill in design which every one now sees that English workpeople ought to possess. Those persons who work at Ancoats Hall may, I think, feel sure that any successful humanising work they do there will not only influence the neighbourhood of Ancoats Hall, but will soon affect the management of other museums.

The Museum is closed to the public all day on Tuesdays, being reserved on Tuesday evenings for conversaziones of societies of workpeople. On other workdays it is open from two o'clock till dusk and from seven till half-past nine, and on Sundays from two till half-past five.

A Section of Applied Art has been formed by the Society of Arts. Six meetings will be held during the session, at which papers on the application of art to industry will be read. Among the members of the committee are Messrs. T. Armstrong, W. Crane, L. F. Day, Donaldson, Edis, Herkomer, Poynter, Sparkes, and Phené Spiers.

THE EDINBURGH MUNICIPAL BUILDINGS COMPETITION.

THE following correspondence is worth the attention of competitors for the Edinburgh buildings :—

The Right Honourable the Lord Provost of Edinburgh, &c. &c.

10 Abercromby Place, Edinburgh :
December 1, 1886.

My dear Lord Provost,—Municipal Buildings.—With reference to the discussion in the Town Council yesterday, it appears to me that the difference between us is one not of principle, but of fact. I understand your lordship's view to be that, in point of fact, a majority of the ratepayers desire the proposed Bill to be promoted and passed in the ensuing session of Parliament. I, on the other hand, feel assured that an overwhelming majority of the ratepayers condemn what they regard as the indiscriminate haste with which an ill-digested and half-considered scheme is being forced before Parliament. For my part, I shall be quite content to abide by the judgment of the ratepayers, as that may be ascertained in any open and reasonable manner, and I cannot doubt that your lordship will be equally willing to be guided by the public voice in the matter.

I would, therefore, suggest that your lordship should call a meeting of ratepayers, to be held in the music hall or other suitable place on an early day, so that the question between us may be fully discussed and finally determined. There will probably be separate meetings held in some of the wards, but these would in no way affect my proposal.

I may add that every day brings to me new and decided indications of the widespread, if not universal, disapproval by the public of the recent votes of the Town Council. I am satisfied that, if the majority should blindly persist in pressing forward the proposed Bill, they will not only place themselves in direct conflict with the ratepayers, but will also involve themselves and the city in consequences which they do not at present foresee.

Personally I regret that my public duty should have brought me into the position of opposing any scheme which has the sanction of your lordship's approval. But I am satisfied that the public interests demand that the scheme, if pressed forward at present, should be persistently and strenuously opposed at every step.

As the whole question is one of great public importance, I propose to send a copy of this letter to the press to-morrow, along with any answer which I may receive from your lordship.

I am, &c,
J. SMITH CLARK.

City Chambers, Edinburgh :
December 2, 1886.

My dear Sir,—I am favoured with your letter of 1st inst. regarding the proposed municipal buildings.

To your request that I should call a public meeting to discuss the question I cannot accede at the present stage. To do so would be to admit that the majority of the Town Council have not the confidence of their constituents, which, as Lord Provost, I have no right to assume ; and it would, besides, be of little use, as discussion in a public meeting could be satisfactory to no one.

The position at present is that the competing plans will be received by the end of January, and immediately after that date an assessor will be appointed to advise with the Town Council as to the selection of the best plans.

We will then be in a position to ascertain, as nearly as possible, the cost of the buildings, and such modifications as may be deemed necessary can then be made.

The whole matter of plans and cost will then be submitted to the ratepayers in such manner as may be thought best to secure public attention, and to elicit an expression of public opinion, and ample time will be given before the sitting of the Parliamentary Committee to discuss the question.

There is not the least desire on my part, or on the part of any member of the Council, to force the matter on an unwilling public, and I cannot agree with your assumption that a majority of the ratepayers are opposed to the action of the Town Council.

You have repeatedly spoken of the measure as an "ill-digested and half-considered scheme," but you have never condescended to state in what way it is so.

In the case of the Glasgow municipal buildings an Act was obtained and a site purchased two years before plans were advertised for, and after that the first plans were set aside and others obtained upon a greatly increased estimate. We have thought it safer that the cost should be ascertained *after* plans are received, but *before* the Bill goes into committee, and I think that is the wiser course.

I still believe that the public is with us in the desire to have suitable municipal buildings, and it is certain that several of the minority who voted with you at last Council meeting admit the necessity for new buildings and approve of the present site.—I remain, &c., THOMAS CLARK, Lord Provost.

10 Abercromby Place, Edinburgh :
December 2, 1886.

My dear Lord Provost,—I have yours, for which I am much obliged. In requesting your lordship to call a public meeting, I do not ask that you should assume that the Town Council had not the confidence of their constituents. What I desired was to apply a plain and palpable test to the question of fact which is in dispute between us, viz., whether the ratepayers approve or do not approve of our pressing forward the proposed municipal buildings scheme at the present time. It will be for the public to judge between us, and to deal with the position which I understand your lordship to take up, viz., that while you contend that the public is with you, you will take no step to give the public an opportunity of expressing its opinion.

I have repeatedly explained why I characterised this scheme as an ill-digested and half-considered one. We know nothing, even approximately, of the probable cost or extent of the buildings to be demolished, or of those to be erected. In short, we are in ignorance of every material fact, except that there are to be municipal buildings somewhere on or about the present site. I believe that this will be the first occasion on which a Corporation or individual has gone to Parliament in such a state of ignorance as to the scheme to be promoted. The case of Glasgow, as explained by your lordship, would appear to me to be an example rather to be avoided than to be followed, and, so far as I can gather, you are adopting its worst features. They had, apparently, only to change their plans and increase their estimates once. I fear we will not be so fortunate.—I am, &c., J. SMITH CLARK.

TESSERÆ.

Sketching from Nature.

J. EAGLES.

SKETCHES that take more than a couple of hours will generally be found untrue somewhere ; and it is far better to give the true impress and character of nature, both with regard to colour and effect, than to labour at detail too long, to the sacrifice of that which is of greater moment. Besides, one great charm of sketches is in their suggestive character ; they are not finished pictures, and not the worse on that account. We know it is the practice of many artists to go again and again to the same spot, and work day after day for a given time at one picture—in fact, to finish the piece, as they would say, from nature. This may be very well for some painters, and suit the character of their works ; but on the whole we think it a bad practice, for the following reasons. In the first place, unless a mere view be intended, the artist loses sight of the principle of art, that it is not imitation ; and that whatever his subject may be, after having taken the impress of it from nature, he has to add to it his own mind, which he will scarcely do when all his powers are tasked to the toil of an exact imitation. In the next place, such changes take place in most scenes, by the variations of light and shade, that beyond a few hours the work can hardly be said to be one of the same nature. And as to coming day after day to the same spot, few days are so alike as to make that practice safe for truth's sake. And what is of more importance still, it may be asked if the artist's mind's eye is in the same condition, may not new impressions be made, and the piece become converted in parts —a mass of incongruous alterations, a fatiguing labour in vain ? Even in painting pictures, we believe those works are the best where the whole subject most resembles a sketch, as put in at once upon the canvas in the course of a day, care being taken in all the subsequent work not to disturb this one character, for the mind works rapidly. After that first work comes technical knowledge and display, certainly of great value when it does not obliterate the mind's work. On every account, then, we think that sketching from nature should be a peculiar kind of painting, having a distinct beauty of its own, and its chief characteristic should be its suggestiveness. Herein lies its great charm ; we recognise nature, and see in it a glimpse of art ; and this is what nature does to the poet's sight, offering much and suggesting more. Art grows not out of the perfect but the imperfect. An exact, too accurate imitation, shows imitation to be the object ; it is for the outward sense, not for the creative mind. If this be so, there is a point of labour which the sketch should not reach ; if it do, it becomes a picture, a thing of art, in which the great principle of art, the working of the inventive mind, is wanting.

English and Italian Towers.

E. A. FREEMAN.

The likeness between our early towers and the Italian campaniles has often been remarked ; in fact, it is more than

likeness. The two things are absolutely the same. It is, of course, less striking in the grander and richer Italian towers; but take some of the smaller and ruder. There are towers both in Verona and in Venice which no one would feel to be out of place in company with Coleswegen's towers at Lincoln. In fact, with such examples as the church of the Apostles and the little church by the great Scala tombs at Verona, it can hardly be said that the English examples are ruder than the Italian. Yet these towers differ in nothing but their rudeness from the mighty campaniles of Murano and Torcello, and from the noblest of its class on this side of the Adriatic, the tower of St. Zeno at Verona. The tall, slender, unbuttressed tower, with its mid-wall shafts in the belfry stage, with its ornaments, if it has any, confined to flat pilasters and arcades, is the tower common to all Western Europe up to the eleventh century. We find it in our own island; we find it all over Germany from Schaffhausen to Bremen; we find it in all the valleys of the Pyrenees and in the heart of the Burgundian Alps. But Italy is its birthplace, and it is in Italy alone that we can study its origin and meaning. What at once distinguishes the Italian campaniles and the towers which follow their model, is their height and absence of buttresses. This last feature, indeed, they share with Romanesque buildings of all kinds: our own Norman in its purity has no true buttress; it never gets beyond flat pilasters. But in the towers of later date the buttresses become features of such special importance that an unbuttressed tower strikes us more than any other unbuttressed portion of a building. The height, again, is a characteristic of bell-towers as bell-towers; the low massive Norman tower always shows to most advantage as a central lantern; it is the descendant, not of the campanile, but of the cupola. The flat pilasters and arcades, which are the common ornaments of Romanesque buildings, assume a special prominence in the case of these tall towers, whose apparent height and squareness they seem to increase by dividing them by a series of vertical strips. These strips in a ruder form were long ago noticed as a characteristic of the so-called "Anglo-Saxon" style in England; but they are characteristic of it only as being one variety of this common primitive style. The Italian and the English towers differ, not as members of two different classes, but only as highly-finished examples of one class differ from ruder examples of the same. The same truth comes out also if we look a little more into detail. The long-and-short work at the angles of English towers, the great slabs of stone used in the construction of early doorways in England, and still more in Ireland, all are, as we soon learn at Verona, imitations of Roman masonry. So, again, such capitals, if we can so call them, as we see in the tower arch of St. Benet's at Cambridge are clearly copied from work like that in the arch-way of the palace called Theodoric's at Ravenna. The mid-wall shafts of the windows are well-nigh universal in the Italian towers, and a little further study of the details of the Italian Romanesque easily explain their history.

The True Use of Gothic Examples.

SIR G. G. SCOTT.

The revival of Pointed architecture in no degree necessarily involves, and cannot be in the least promoted by, the mere copying of ancient examples. The great object to be aimed at by the student is so perfectly to familiarise himself with the character of the ancient works of art, by taking every opportunity of visiting, sketching, and contemplating them, and so to imbue his own mind with its beauties and principles, as to be able naturally to design in it as the spontaneous and vernacular expression of his own architectural thoughts. The student of a foreign tongue will naturally at first mix up merely servile transcripts with his own broken attempts at composition, but when he has once mastered the language, he adopts it as his own, and can think in it, and express his thoughts in it, with fluency and ease. It is just so with the student of Gothic architecture; it is, it is true, his native language, but he has been long estranged from it, and perhaps taught to connect all his ideas of art with an exotic style, so that in studying that which is, in truth, his birthright, he is at first constrained to express his thoughts in it by a mixture of smattering and servility; but when his mind has once become familiarised with its principles, he feels that it is in every sense his own, and he then finds it easier to design than to copy—easier to clothe his ideas in correct expressions than in smattering and broken language.

Top and Bottom Flanges of Wrought-Iron Beams.

EDWIN CLARK.

It is obvious that if twelve tons per square inch were the ultimate tensile strength of wrought-iron, such beams should have the same quantity of material in both their upper and lower flanges. This is, however, not the case; the ultimate tensile strength is considerably greater—viz., nearly twenty tons—while the ultimate compressive strength is sixteen. The top and bottom flanges should thus be in he proportion of sixteen to twenty, or four to five, *i.e.*, the bottom flange should be four-fifths of the top flange for both to fail simultaneously, which is just the reverse of cast iron, where the lower flange is required to be six times greater than the upper on similar grounds. With wrought-iron work, where rivetted plates are used, the bottom alone is weakened by the rivets passing through the plates, the top remaining uninjured as regards compression, and on this account (neglecting the rivets in the calculation) little difference is practically made in the area of the top and bottom flanges of such girders.

Theorising in Art.

C. R. COCKERELL, R.A.

Philosophical discussions upon the sublime and beautiful will always be valuable as one of the means of instruction; but the subject is so subtle that it is not to be circumscribed by language, however logical. It is, after all, to genius we must look for the exact adjustment of those qualities on which the beautiful depend. The artist may lay down incontrovertibly his principles of art, but their adoption in particular proportions may not always succeed. To the practical student only belong the scruples and the grains of proportion, and it is in labour only combined with genius that the philosopher's stone is to be found by the artist. The speculative part of the fine arts, without the assistance of manual operation, can never attain perfection. Each department of art is of sufficient importance to occupy the whole attention of one man, but it is essential in an art where so many details are involved that the student should occasionally be awakened to an enlarged view of the subject, and it is for this purpose that I have in former lectures taken extended views of the history of our art, and directed your attention to the magnitude of its extent; for to know what has been done is to know what can be done. Charles V. said well that a man who possessed many languages became, in fact, multiplied into many individuals, and enjoyed in an increased degree the privilege of existence. And the same remark might be applied to the architectural historian, whose experience teaches him the peculiarities of different nations, and points out to him the propriety or otherwise of peculiar applications to particular circumstances.

Siena Cathedral.

M. VALERY,

The cathedral of Siena, one of the oldest, most splendid, and most characteristic in Italy, appears of divers epochs and architects, but its ensemble must go back to the thirteenth century. The present church, finished in 1331, was only to have formed one of the side naves of the grand edifice which had been projected, but was abandoned on account of the fatal plague of 1348. Among the numerous ornaments of the airy front of 1339, the statues of the prophets and the two angels prostrate before the name of Jesus are by Jacobo della Quercia. The busts of animals over the capitals allude to the cities allied with the republic: the griffin, Perugia; the horse, Arezzo, &c. The three busts over the door represent three Sienese saints. The religious and political reminiscences of the country are thus associated on the front of the temple. The steeple, an old tower of the Bisdomini, was covered with marble, and embellished from the designs of the brothers Agostino and Angelo, of Siena, sculptors of the beginning of the fourteenth century, disciples of the Pisan school, and the former was employed in the works of the cathedral from the age of fifteen years. One of the bells, in the form of a barrel, is dated 1148. The interior of the basilica, encrusted with black and white marble, with its bold and lofty roof of azure studded with golden stars, and its hexagonal cupola, is singularly religious and venerable in its aspect. The two majestic columns of the doorway, sculptured in 1483, support an elegant gallery with four basso-relievos representing *The Visitation*, a *Sposalizio*, *The Removal of the Virgin's Body*, *The Assumption*—excellent works but hardly visible. The painted glass of the circular window, executed in 1549 by the clever Sienese artist Pastorino di Giovanni Micheli, from the designs of Peirino del Vaga, is of extreme richness. Among the numerous series of popes on the frieze, the bust of Pope Zacharias is an ancient head of Pope Joan, thus metamorphosed in 1600 by the Grand Duke, at the request of Clement VIII. and the archbishop, Cardinal Tarugi. Mabillon endeavoured to find this bust of Pope Joan, but was unsuccessful. Montfaucon is wrong in saying that it is changed into the prophet Zacharias. The pavement, now unique, comparable to the most precious mosaics of Greece and Rome, but of Italian invention and Sienese execution, a vast *niello* in marble in the best style of composition, ought to be seen from above. It must be considered an error on the part of the Sienese artists to have placed figures in chiaro-oscuro on the ground, which cannot be trod upon without injury, and the pavement is consequently obliged to be covered. The sumptuous chapel *del voto* was erected by Pope Alexander VII. The superb carvings in wood of the choir stalls, desk, and seats of the hebdomadary belong to different periods between 1387 and 1569.

Timber for External Work.

T. W. SILLOWAY.

When a piece of framing is to be permanently exposed to the weather, it should be treated with one of the preservative solutions, and then thoroughly painted and sanded. Wood in a proper condition when felled, afterwards thoroughly seasoned, well saturated with diluted corrosive sublimate, and finally kept properly painted and sanded, is as durable as it ever can be. One caution it would be well to remember, namely, to refrain from applying paint or any preparation to wood before it is thoroughly seasoned; for should the outside be coated so as effectually to prevent impenetration from without, evaporation will also be prevented from within; therefore, all moisture that may be in the wood will be retained, and rot the piece. Another suggestion is to use timbers as small as the nature of the work will permit. It is a mistake to suppose that large timbers will continue good longer than small ones. The light spokes of a wheel will remain sound and strong for years after the tongue of the cart to which they belonged has entirely decayed. If a timber is sufficiently strong when first used (the requisite allowance being made for permanent strain), all has been done that prudence would dictate, since no increase of the dimensions of the piece will insure its longer duration. And, finally, it should be scrupulously remembered that timber will not certainly remain sound because a large portion, or even most of it, is in proper condition and well cared for. Only so much as is actually protected will retain its qualities, and any part so exposed as to injure the whole stick will as surely injure or destroy the unprotected part. Therefore the ends of timbers which are built into walls, also all surfaces in contact—as where the side or edge of one stick rests upon another, tenons, in mortises, &c.—should be supplied with air, kept dry, and in every way properly protected.

Struts and Ties in Carpentry.

SIR J. ROBISON.

It depends entirely on the position of the pieces in respect of their points of ultimate support, and of the direction of the external force which produces the strains, whether any particular piece is in a state of extension or of compression. The knowledge of this circumstance may greatly influence us in the choice of the construction. In many cases we may substitute slender iron rods for massive beams, when the piece is to act the part of a tie. But we must not invert this disposition; for when a piece of timber acts as a strut, and is in a state of compression, it is next to certain that it is not equally compressible on its opposite sides through the whole length of the piece, and that the compressing force on the abutting joint is not acting in the most equable manner all over the joint. A very trifling inequality in either of these circumstances (especially in the first) will compress the beam more on one side than on the other. This cannot be without the beam's bending and becoming concave on that side on which it is most compressed. When this happens the frame is in danger of being crushed and soon going to ruin. It is, therefore, indispensably necessary to make use of beams in all cases where struts are required of considerable length, rather than of metal rods of slender dimensions, unless in situations where we can effectually prevent their bending, as in trussing a girder internally, where a cast-iron strut may be firmly cased in it, so as not to bend in the smallest degree. In cases where the pressures are enormous, as in the very oblique struts of a centre or arch frame, we must be particularly cautious to do nothing that can facilitate the compression of either side. No mortices should be cut near to one side; no lateral pressures, even the slightest, should be allowed to touch it. We have seen a pillar of fir 12 inches long and 1 inch in section, when loaded with three tons, snap in an instant when pressed on one side by sixteen pounds; while another bore four and a half tons without hurt, because it was enclosed (loosely) in a stout pipe of iron.

Celtic Illuminators.

SIR M. D. WYATT.

Among the earliest "societies for the propagation of the gospel in foreign parts" were the bands who carried the cross to the regions of the North, and with it took those singular types of ornament which were slowly adopted by the Scandinavian artists during the tenth and eleventh centuries. The monks of Iona, under the great Irish saint and scribe, Columba or Columbkill, and their Anglo-Saxon disciples at Lindisfarne, under his friend St. Aidan, together with the Irish monks at Glastonbury, spread Celtic ornament in England, from which it had to a great extent retired with the expulsion of the ancient British. St. Boniface, the principal awakener of Germany to Christianity, carried with him his singularly ornamented book of Gospels, which is still preserved as a relic at Fulda. Similar evidence of the transmission of the art prevalent during the early centuries of the church in Ireland to other lands, by means of the missionaries who left her shores, is to be found in the books of St. Kilian, the apostle of Franconia, still preserved at Wurtzburg; in those of St. Gall, now in the public library of St. Gall, in the Canton of Switzerland which still bears his name; and in the very important series connected with the monastic institution founded by St. Columbanus, at Bobbio, in Italy, of which last Muratori has given an interesting catalogue. Many of these saints were themselves scribes, and their autograph copies of the Holy Gospels are still in existence, with the name of the writers in some cases, identifying the volumes and absolutely fixing their date. Thus we have the Gospels of St. Columba, the Leabhar Dhimma, or Gospels of St. Dhimma Mac Nathi, and the Mec Regol Gospels in the Bodleian Library. All of these are anterior to the ninth century, and are distinguished by an elaborate style of ornament, unlike any other European type. In delicacy of handling and minuteness of faultless execution the whole range of paleography offers nothing comparable to the early Irish and British manuscripts. When in Dublin some years ago I had the opportunity of studying very carefully the most marvellous of all, "The Book of Kells," some of the ornaments of which I attempted to copy, but broke down in despair. Of this very book Mr. Westwood examined the pages, as I did, for hours together without ever detecting a false line or an irregular interlacement. In one space of about a quarter of an inch superficial he counted, with a magnifying glass, no less than one hundred and fifty-eight interlacements of a slender ribbon pattern, formed of white lines, edged by black ones, upon a black ground. No wonder that tradition should allege that these unerring lines should have been traced by angels. The careful student of Carlovingian design cannot fail to trace in much that was done by the great Emperor of the Franks the influence of the Celtic sages who were nearest to his person.

The Teaching of Mathematics.

H. CONYBEARE.

There is no valid reason why applied mathematics should not be more generally substituted in our schools for pure mathematics, and why every example put before scholars should not be a practical instance of the application of mathematics to questions of business or construction. Such a mode of teaching would give a much greater interest to these studies—it would familiarise students with the use of mathematics, and teach them to regard the science of number as a facile tool of almost universal applicability to the everyday purposes of civil and military life. In the earliest works on algebra extant—by Brahmaguphta, who lived in the seventh century of our era, and Bhascara who flourished in the twelfth—there is a constant endeavour to give the examples an amusing character, sometimes carried to the excess of lowering science to the level of a lady's plaything. Take a few examples at random from Bhascara:—"Ten times the square root of a flock of geese, seeing the clouds collect, flew to the nearest lake; one-eighth of the whole flew upon the edge of the water amongst a multitude of water-lilies; and three couples were observed playing on the water. Tell me, my young girl with beautiful locks, what were the whole number of the geese?" Again, "Beautiful and dear Salivati, whose eyes are like the fawn's, tell me what is the number resulting from 135 taken into 12? If thou be skilled in multiplication, by whole or by parts, whether by subdivision of form or separation of digits, tell me, auspicious woman, what is the quotient of the product divided by the same multiplier?" Colonel Lloyd, one of the special commissioners of the Great Exhibition, in his report to Lord Granville, observes that "In France, so great are the facilities afforded by the Government educational establishments—such as the Conservatoire des Arts et Métiers and the Ecole des Arts et Manufactures—that the acquirement of high scientific knowledge in connection with interesting demonstrations and manipulations of all descriptions becomes to the youth of France so fascinating, that at an early age they often pass an examination showing such high qualifications in both science and the arts, that their services are sought for by all the manufacturing countries in Europe."

Stresses in Webs of Girders.

R. H. BOW.

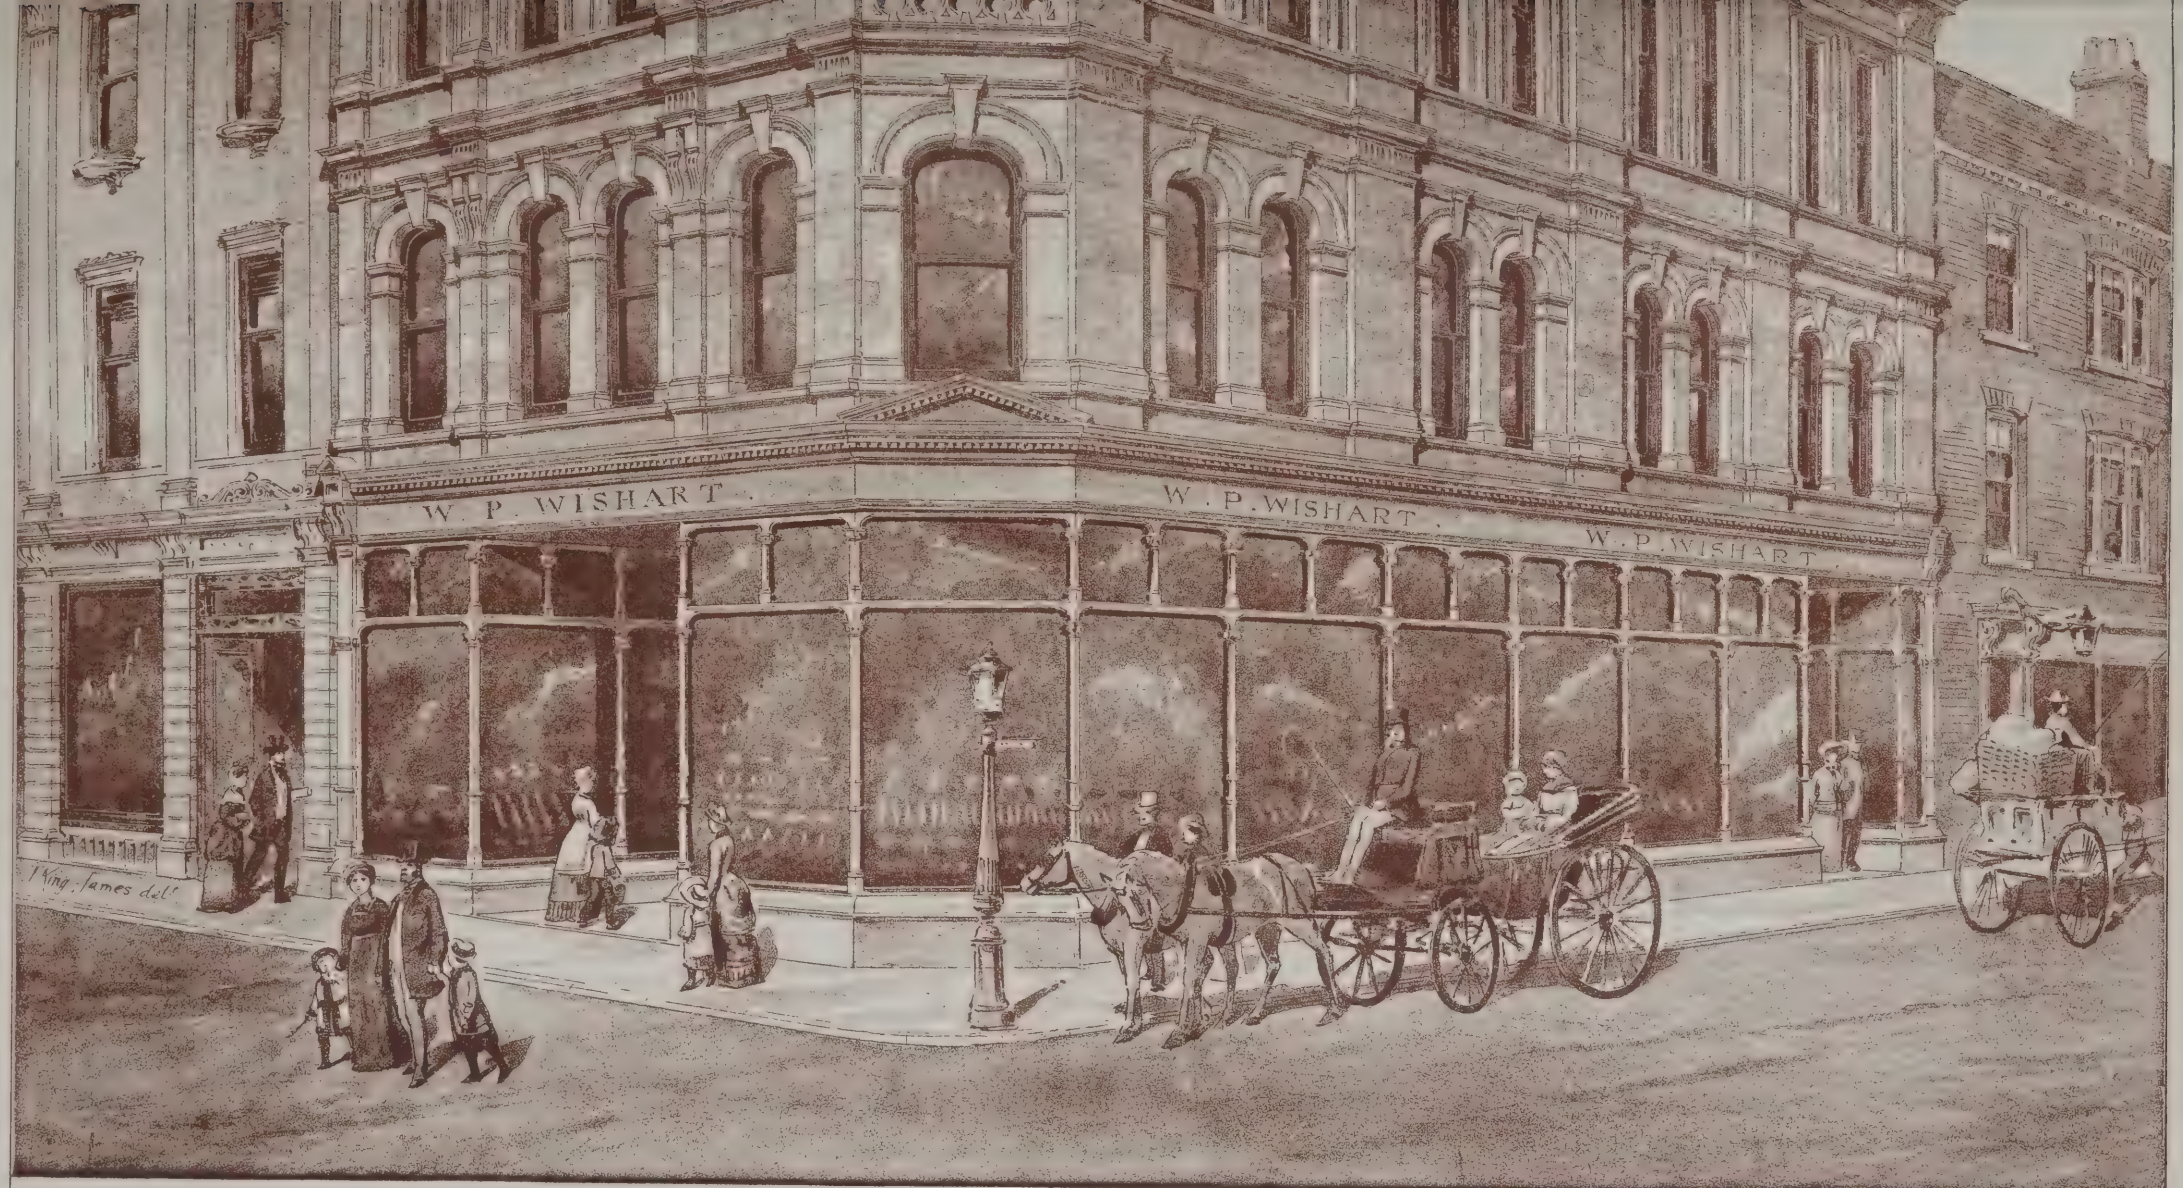
It is too much the custom to represent a load at the centre of a girder as equivalent to twice that load spread uniformly over the span. It is so only as regards the longitudinal stresses at the mid-span, in so far as these are not affected by the stresses induced in the web. But in all other directions the effects of these loadings differ very materially: and therefore the one cannot be correctly substituted as a test in place of the other. When a test-load is placed on the mid-span, the whole length of the web is nearly equally subjected to certain oblique compressions and tensions occupied in transferring from the mid-span to each pier half of the central load. By a correct test-loading, or one of double the former amount, spread uniformly over the girder, the stresses in the web are very different, the part at the mid-span is nearly free from stress; but the parts near the supports are stressed to double the degree caused by the former load.

NOTES AND COMMENTS.

THE Cambridge Syndicate have grown alarmed about the danger of fire in the University buildings. A report has just been issued in which it is proposed to introduce fireproof doors and shutters for the openings between the rooms. The aid that was available by the presence of an architect as Slade Professor has been turned to account, and it is likely Professor MIDDLETON's recommendations will be carried out without any alteration.

THE sunken orchestra which was introduced by WAGNER, in order that there might be no temptation offered to the spectators to divert attention from the stage, is now adopted in some theatres. The arrangement has one great advantage, for if there are few instrumentalists the audience is no wiser. Sir GEORGE GROVE recommends that the invisible orchestra should also be adopted in concert halls where oratorios and cantatas are sung. He says that if the plan adopted by WAGNER for the theatre were brought into the concert-room—the orchestra and conductor sunk just out of sight of the audience, though in view of the singers, and the chorus and principals given more room and freedom and more proximity—there would be a better recognition of situation implied in the words, and fine music would gain in effect, because the story would be made more intelligible, and a great deal which has nothing to do with the words be removed out of sight. The rationality of an oratorio is not evident, and that form of composition has flourished nowhere so well as in England. Elsewhere it is supposed that the stage is the proper place for the display of dramatic music. It would be interesting to have the experiment tried of erecting such a concert-hall as Sir GEORGE GROVE suggests, but what would the instrumentalists say to the proposed position? In theatres they are not of much account, but the case is different in a concert-room.

AN interesting paper on cadastral surveys was read lately at the Institut of Geneva by M. MESSERLEY, a geometrician. It appears that a survey of the kind was executed many centuries ago in France. In 1359 CHARLES V. ordered a revision of one which existed, and in 1491 CHARLES VIII. made arrangements for a general survey of his kingdom. All these surveys were intended to aid in the assessment of taxes. The survey of Savoy, which was ordered by VICTOR AMADEUS in the eighteenth century, was also intended to define the limits of estates, and it is worth recording that ROUSSEAU helped in the work. The first cadastral survey of the Canton of Geneva was made in 1475, when a special war tax had to be levied, but a survey of the city was not made until 1732. Prussia, which is such a model of organisation, has not overlooked cadastral surveying, and it may be noted that the direction is in charge of the great master of tactics, Marshal MOLTKE. When the Ordnance Survey is complete, this country need not be afraid of a comparison of plans with any on the Continent.



WE described lately the conditions of the competition for the decoration of the Mairie of Pantin, one of the suburbs of Paris. The sum of 36,000 francs is to be expended. No less than seventy painters sent in sketches. It was arranged that the competitors could select three artists to serve as jurors along with the official representatives, and the choice fell on MM. PUVIS DE CHAVANNES, CABANEL, and OLIVER MERSON. Pantin is not a place with a history, and therefore one class of illustration must be foregone. Neither can it be said to have any special industry to form a subject for a realistic work. Destiny is evidently inimical to the place. According to the etymologists, the name ought to be Pentin, suggestive of a *pente* or incline, but the village has always stupidly persisted in standing on a level plain, and will not be correct in its orthography. With a slope in one of its streets it would be possible to depict the suburb as if it were precipitous in approach and picturesque. It will not even afford ground for a decent landscape. The subjects had, of necessity, to be typical or allegorical, and many of the works were more suggestive of Arcadia than of Paris. There were various representations of an ideal Fête de la République, and of the different ages of man. In one, MERCURY was seen presenting the Pantin workman and family to the Genius of the Republic; in another, Fame was introducing the Spirit of Commerce to the Pantinites; the Age of Gold reappeared on canvas, and *Vita rustica*, which is the same thing. Seeing the shortcomings or the neglect of the annalist, one competitor took it for granted that the fair of Pantin, which takes place on the second Sunday in August, must be of ancient date, and he therefore imagined what it was like in the time of PHILIP AUGUSTUS, or A.D. 1215. Several of the artists seized the erection of the mairie as a theme, and represented the inhabitants as directing the construction of the building. The sketch which seemed to gain most approval was one in which Pantin was made the scene of a struggle to keep BLUCHER out of Paris in 1814. It was by M. SCHOMMER, and he has been selected, along with M. HENRI LEVY and LAFON, to prepare the panels for the second competition.

THE directors of the Yorkshire Penny Bank were able to institute a competition for a new building in Halifax among the following architects, viz. :—Messrs. KELLY & BIRCHALL, PERKIN & BULMER, SMITH & TWEEDALE, and Mr. W. H. SHARP and Mr. KAYE of Leeds; Messrs. MILNES & FRANCE, of Bradford, and Messrs. BUCKLEY & Son, of Halifax. It was arranged that the author of the first design should receive the commission, and that the remaining competitors should each receive fifteen guineas. This was a piece of fair dealing that is worth the imitation of bodies with more sounding names. The design by Messrs. PERKIN & BULMER was unanimously chosen at the meeting on Friday. The building is to be Gothic in style, and the walls will be of wrought stone. At the rear will be a wool warehouse. The cost will be about 7,000*l.*

L'Art is paying a tribute to the season by the publication of two Christmas numbers, the first of which has just appeared. The principal etching is after one of the lamented ULYSSE BUTIN's studies of sailors, and this *mousse*, or cabin boy, is surprising in its approach to the painter's style. There is also a plate of HOLBEIN's design for JEAN SEYMOUR's cup, and a reproduction of an etching by PAUL HUET. The text is full of engravings, and among the articles may be signalised those on American museums, French woodwork, LIGIER RICHIER, a sixteenth-century sculptor; and the Musée Correr at Venice.

IN July last the Swiss Consul in London announced to the Foreign Secretary that a Conference on International Copyright was to be held in Berne on Sept. 6. After the usual quantity of correspondence had passed the Conference did meet, and there were representatives present from Germany, Belgium, Spain, United States, France, Great Britain, Haiti, Italy, Japan, Liberia, Switzerland, and Tunis. How the authors and artists of Haiti, Liberia, and Tunis are to become gainers by an amendment of copyright regulations is not apparent, but diplomacy is always unfathomable. A draft has been prepared which shows the lines on which an International Union for the Protection of Copyright is proposed to be based. Authors and artists of any country belonging to the Union are to have the same rights in another of the countries as belongs to a native. Among the artistic property protected are works of design, painting, sculpture, and engraving; lithographs, illustrations, geographical charts; plans, sketches, and plastic works relative to geography, topography, architecture, or science in general; in fact, every production whatsoever in the literary, scientific, or artistic domain which can be published by any mode of impression or reproduction. It is proposed to establish an "Office of the International Union for the Protection of Literary and Artistic Works." This office, of which the expenses will be borne by the administrations of all the countries of the Union, is placed under the high authority of the superior administration of the Swiss Confederation, and works under its direction. The functions of this office are to be determined by common accord between the countries of the Union. The expenses are not to exceed 60,000 frs. a year. Subsequently it was agreed to consider photographs as works of art, and to give them legal protection.

ARCHITECTURAL ILLUSTRATION SOCIETY.

NO. 41. INTERIOR, CATHEDRAL, SIENA.

NEW PREMISES, NORTH STREET, BRIGHTON.

THESE premises, which have been recently opened by Mr. W. P. WISHART, of Brighton, occupy a prominent corner position in the leading business thoroughfare of the town. The old shops which they replace were built in the days when Brighton was a royal residence, and were of irregular shape, although not of picturesque appearance, but by an arrangement with the Town Council the new buildings were so set back from the old frontage as to give a uniform line and a greatly improved footway for the public. The contractor for the whole of the works was Mr Councillor BOTTING, and the architects, Messrs. C. E. CLAYTON and E. BLACK, of Brighton, and Mr. C. S. WELLS of London.

BEAUVALE, SUNNINGDALE.

THIS illustration is taken from a drawing that was exhibited this year in the Royal Academy. Mr. GEORGE VIGERS is the architect of the building.

ST. JOHN'S HOME FOR CHILDREN.

FOR some time past an excellent but unobtrusive work has been carried on in two inconveniently small houses at the east end of Brighton, where convalescent children of the poorer classes have been received and well cared for, until the sunny air of London-super-Mare has restored them to health. The new building illustrated is now being erected on an elevated site above Brighton College and on the edge of the Downs, but as the lady superintendent and organiser of this useful charity will not run into debt, only about half the building shown will be completed at present, unless the necessary funds for the whole are subscribed. The building is being erected by Mr. JAMES BARNES from the plans of Messrs. C. E. CLAYTON and ERNEST BLACK, of Brighton.

THE ARCHITECTURAL ASSOCIATION.

THE fourth ordinary meeting of the Association was held on Friday evening, Mr. J. A. Gotch, president, in the chair.

Donations to the library were announced, and votes of thanks awarded to the donors.

The following gentlemen were elected members :—Messrs. C. Bywater, C. J. Willett, E. Fagg, T. McLaren, A. H. Clark, Vincent Craig, H. Goodman, R. O'B. North, G. E. Nield, E. Marshall, C. W. Harvey, A. Turnbull, C. E. Audoire, S. French, A. Collins, J. M. Elton, J. D. Scott, H. S. Tiffin, C. A. Tijou, H. S. C. Cory, R. D. Wary, J. Borrowman, W. G. Morrison, C. H. Freeman, F. R. Taylor, and H. D. Lloyd.

Prizes.

Mr. H. D. APPLETON, hon. secretary, announced additional prizes offered for competition in the present session. A prize of 10*l.* by Mr. T. Blashill for the study of Italian architecture; 5*l.* by Mr. Arthur Cates for the student passing the R.I.B.A. examination; and three guineas by Mr. Ernest Turner, to be given in the elementary classes, the conditions of which were being arranged by the committees, and would be posted in due course to the members.

Mr. T. PRIDGIN TEALE, M.A., read a paper on

Fireplaces.

Mr. Teale said he gladly had taken this opportunity afforded him of advancing a work that had been taken up to persuade the nation to abandon the wasteful, soot-producing, inefficient, and ill-principled methods of burning coal for domestic purposes almost universally in vogue. He proceeded then to consider the principles of construction of fireplaces, and laid down for discussion the following :—

Rules of Construction.

1. As little iron as possible.

2. The back and sides of the fireplace should be of brick or firebrick.

3. The firebrick back should lean over the fire, not lean away, at an angle not greater than 70 degrees.

4. The bottom of the fire, or grid, should be deep from before backwards, probably not less than 9 inches for a small room, nor more than 11 inches for a large room.

5. The sides, or covings, should be vertical, but inclined to one another, as the sides of one equilateral triangle.

6. The slits in the grating or grid should be narrow, not less than $\frac{1}{4}$ inch nor more than $\frac{3}{8}$ inch in width.

7. The front bars should be vertical, that ashes may not lodge and look untidy; narrow, perhaps $\frac{1}{4}$ inch in thickness, so as not to obstruct heat; and near together, perhaps $\frac{3}{4}$ inch apart, so as to prevent coal and cinder from falling on the hearth.

8. There should be a rim 1 inch or $1\frac{1}{2}$ inch in depth round the lower insertion of the vertical bars.

9. The chamber under the fire should be closed by a shield or "economiser."

10. Whenever a fireplace is constructed on these principles, it must be borne in mind that a greater body of heat is accumulated about the hearth than in an ordinary fireplace. If there be the least doubt whether wooden beams possibly run under the hearthstone, then an ash-pan should be added, with a double bottom, the space between the two plates being filled with artificial asbestos, $1\frac{1}{2}$ or 2 inches in thickness.

11. See that no woodwork comes within 10 or 12 inches of the back of the fire.

The advantages resulting from the adoption of this model fireplace were then detailed. The saving of coal was probably never less than one-sixth, rarely less than one-fourth, not unfrequently one-third, and some persons declared that in individual grates the saving had been one-half; to be within the mark, a possible saving to the country of one-fourth, which meant coals gratis for three months in the year. Next in saving of labour. Every ton of coal saved meant 112 coal-pans fewer to be carried by the servant. If the model fireplace were adopted, no cinders fell on the hearth. No sweeping up of the hearth was needed from morning till night; there was very little ironwork and no bright steel to be polished; and no constant attention lest the fire should go out. As to saving of dust, he had the strongest testimony as to the reduction of dust in rooms and in kitchens following the adoption of the "economiser." The reduction occurred in many ways. The dust that fell on the hearth was boxed in by the "economiser," and so could not fly about the room. There was no poking of the bottom of the fire to remove dead cinders and dust, which choke the fire and make it burn dead, as the fire remained red at the bottom and the combustion of cinders went on even when they were in contact with the bars of the grating, which were kept hot by the "economiser." The periodical sweeping of the hearth and the clearing away of cinders and ash from beneath the fire was done away with, and the ashes needed clearing away from their chamber no oftener than once or twice a week. The saving of noise in the sick-room was also considered. Another advantage described was increase of warmth as distinguished from increase of heat—heat as a mechanical force being one thing, and heat as conveying comfortable physiological warmth to the human body being another. Several instances had been told to him of rooms which various fireplaces had failed to warm having become perfectly warm and comfortable in every way after the adoption of this system. The remarkable fact might often be observed that on entering the doorway of a room you could at once feel the warmth from the fire, and at the same time you might sit close to such a fire without being scorched.

As to little need of attention, a fire might as a rule be left four or five hours, sometimes six or seven from mending, and still when mended would quickly burn up. This resulted from the fact that besides the small body of coal on a grid, still red hot, there was a large body of heat stored up in the floor and walls of the chamber under the fire. What a boon this quality was would be realised by the occupants of offices and lodgings, who knew to their cost the misery of returning to their room on a cold day to find the fire out, or newly mended with a mass of coal that had quenched the remnant of heat in the fire, and did not blaze up for half an hour or more. Another advantage: the fireplace was warm the following morning. The heat stored in the firebrick was slowly given off after the fire went out during the early hours in the morning and prevented chilling of the room, whilst the heat that still remained secured rapid burning up of the fire when lighted, if indeed there were not some burning embers still left from the fire of the night before. There was strong reason to believe that the reduction of soot and smoke by these fireplaces, was very great, but he had not yet brought this point within the range of precise measurement. He would ask anyone interested in the point to take every opportunity of watching the smoke issuing from the chimney of one of these fireplaces, and compare it with the smoke from ordinary fireplaces. Lastly, there was an advantage which might be claimed from the architect's point of view. In advocating the reduction of iron to a minimum, and the substitution of brick at the side, back, and face of the fireplace, he was recovering for the architect one of the most important

elements in house-building for artistic and constructional design, which had of late been too much under the sway of the worker in iron, to the great loss of the community.

An informal discussion attended the reading of the paper, the discussion being taken clause by clause, the speakers being the President, Messrs. Cole A. Adams, M. B. Adams, Hilton Nash, Leonard Stokes, Brodie, Notley, and G. A. Pryce Cuxon.

On the motion of Mr. M. B. Adams, seconded by Mr. Notley, a vote of thanks was passed to Mr. Teale for his paper.

THE LATE J. M. BARCLAY, R.S.A.

MANY will hear with regret of the death of this well-known and much respected member of the Royal Scottish Academy, which took place, says the *Scotsman*, on the 1st inst., at his residence, 11 Forres Street, Edinburgh. Mr. Barclay attended the general meeting of the Academy on the 10th ult., and took an active part in the important business then transacted. He was struck down next day with an inflammatory internal complaint, from which at first no serious result was anticipated. The disease was successfully combated, but from the state of prostration in which it left him he was unable to rally. He was seventy-five years of age. The early art career of Mr. Barclay, like that of not a few men who have attained to some position in this profession, is not without its romantic side. Born in the fair city of Perth when the century was young, he early displayed a taste for drawing, to gratify which became an absorbing part of his daily life. At the Perth Academy, where he was educated, there was a master who went by the familiar name of Dicky Junner, who gave lessons in the art. In his room was a work of his own, the portrait of a Highlander, which was regarded by his youthful pupils as a perfect masterpiece. It was nothing to them that the carpet had been measured off with a ruler, and showed the lines; it was the standard to which they appealed, and young Barclay often stood admiringly before it, wondering if he would ever paint such a portrait. It is a somewhat remarkable incident that many years afterwards the identical portrait found its way to Mr. Barclay's studio in Edinburgh—the then owner being desirous that something might be done to give it a more life-like appearance. Thomas Duncan, A.R.A., had attended the same school, and "Dicky" claimed them both as distinguished pupils. Barclay was on intimate terms of friendship all his life with Duncan, and used to tell a good story of the distinguished painter, who is best remembered by his Jacobean paintings. Awaking early in the morning, he was amazed to see one of his large pictures—it was *Prince Charlie entering Edinburgh* or the *Charles Edward protected by Flora Macdonald after Culloden*—hung at the head of Duncan's bed, while he himself was earnestly studying it. Duncan felt there was something wrong with it, but could not make up his mind what it was; he had been unable to sleep all night, and had had in the picture the first thing to try to get it put straight. Mr. Barclay's father, having little knowledge of the higher walks of art, thought he was doing his duty by his boy, and humouring his bent at the same time by placing him in a civil engineer's office. There he remained for some time, learning, at all events, in a systematic way the elements of precise draughtsmanship, which came not amiss in after life. Barclay's first love, however, was not displaced by engineering. In order to practise painting he was wont at this period to get up at four in the morning, and work at his easel until it was time to go to the office for the day. He painted his sister's portrait in these early hours; but the sitter, not having the same enthusiasm, often fell asleep. This interesting portrait is still in the possession of a relation of the family. By-and-by Barclay came to Edinburgh to become a student of Sir William Allan in the Trustees' Academy, his student's career being not unmarked by the hardships which beset a youth from the country whose purse is not too well lined. One of Barclay's first commissions in Edinburgh came to him in a curious way. His landlady was proud of her artist lodger, and liked to exhibit him and his pictures. One day, when financial affairs were low, a gentleman was brought in to see his pictures. He offered the young artist 5*l.* and a new easel if he would paint his portrait. The offer was gladly accepted, and the portrait then painted is now in the possession of, and greatly prized by, the Dean of Guild of the city. After he became a full-fledged artist Mr. Barclay returned to Perth, and there practised his profession with great success for a considerable number of years. He painted the portraits of nearly every magnate in the county, and works of his are to be found in nearly every house of any note in this district. The first portrait which really brought him into public notice was that of the late Duke of Athole—a work now in the possession of the Duchess Dowager. It was exhibited at the Royal Scottish Academy, and it also appeared on the walls of the Royal Academy and the Salon. To it he in great measure owed his election as an Associate of the Royal Scottish Academy in 1863. Shortly after this he removed to Edinburgh, where his hands were kept pretty fully occupied in the production of presentation portraits and more private commissions. Among other excellent full-size portraits which he painted were those of Judge Townsend, Lord Kellie, the Rev. Dr. Paul, the present Duke of Athole (1877), and Lieutenant-Colonel Burnley Campbell, with his horse. These and many others were exhibited at the Royal Scottish Academy exhibitions, for he believed in the Academy, and thought it ought to get the best his brush could produce. In his younger days he made sketches for ideal pictures, but had little time to prosecute this branch of his art. His historical pictures, *The Gowrie Conspiracy* and *An Incident in the Life of Bruce*, however, will be remembered; and he contributed from time to time small domestic genre pictures which rarely missed in interest. Mr. Barclay was elected an Academician in 1871, being then nearly sixty years of age; and, on the death of Mr. Perigal, he was elected to the office of treasurer. He was an intimate friend of the late Kenneth Macleay; but, indeed, in the Academy his geniality and kindly disposition secured him the esteem of all with whom he came in contact. In the Life School—of which he was a visitor, with but one break of a year, from 1874 till his death—he was a great favourite with the students; and at the meeting of the Academy the tribute paid to his memory by the President was felt to be well deserved. Though in his later years he was greatly bent by rheumatism and other causes, he was in his youth a fine handsome fellow, 5 feet 11 inches in height, delighting in athletic exercises. He had a great taste for music, and was an excellent singer—his songs being ever in great repute at the symposiums of the Academy, at his own table, or at the table of his friends. As a portrait painter, Mr. Barclay made for himself an excellent reputation; as a man, he leaves behind him many sunny memories, which his friends will long cherish. He is survived by a widow and two daughters.

THE STORY OF A STATUE.

VISITORS to the Louvre of late may have noticed a remarkable little marble statue labelled *A Young Athenian Girl*. The story of its discovery and acquisition, just disclosed by the *Temps*, forms a curious page in the history of antiquities, and suggests that public like private collectors are not always willing to respect local laws. A peasant of Patissia, while digging in the fields, suddenly came across an old statue. Knowing that the Greek law forbids the exportation of ancient objects of art found in the country, and that foreign amateurs are always ready to pay a high price for them, he at once took it home and hid it under a heap of faggots. He then went to the French ambassador, who was well known for his love of such relics, and offered it to him for 12,000 frs. The ambassador repaired secretly to the peasant's dwelling to examine it, and found it was a bonâ fide gem of the fourth century. He telegraphed the discovery to the French Minister of Fine Arts, who authorised him to conclude the bargain. But there was a serious difficulty to overcome, and that was to get it out of the country without being detected by the Customs authorities. After some reflection, the ambassador instructed the peasant how to set to work. He was to hide the statue in a cartload of vegetables, drive down to a creek on the seashore, where he would find a boat from the French sloop stationed at the Piræus waiting to receive him. The job was performed successfully. The statue, in the midst of the vegetables, was shipped on the boat, and the 12,000 frs. were handed to the peasant by the captain as he left the shore. On the arrival of the statue in Paris it was placed in the Louvre, not far from the famous *Venus of Milo*, while its discoverer, the Greek peasant, is now leading the life of a small gentleman farmer on the proceeds.

VALUE OF SCOTTISH PAINTINGS.

ON Saturday last a collection of paintings formed by the late Mr. Robert Horn, at one time Dean of the Faculty of Advocates, was sold in Edinburgh. Among the highest prices were the following, viz.:—

"Wearing Ship," by Sam Bough, R.S.A., water-colour, 10½ by 11, 26*l.* 5*s.*

"The Fishmarket at Rome," engraved in the "Landscape Annual" for 1830, page 267, by Sam Prout, 8½ by 13, 68*l.* 5*s.*

"On the Gareloch," by John Milne Donald (1858), 16½ by 12, 24*l.* 3*s.*

"Dysart—Ravensheugh Castle," by Sam Bough, R.S.A. (1856), 11½ by 8, 56*l.* 14*s.*

"Edinburgh from Canonmills," from the Collection of Stewart of Duncarn, by Miss Ann G. Nasmyth, 15½ by 11½, 26*l.* 5*s.*

"The Gleaner," by Robert Herdman, R.S.A. (1862), water-colour, 5 by 7, 54*l.* 12*s.*
"Berwick-on-Tweed," by Sam Bough, R.S.A., water-colour, 13½ by 9, 27*l.* 6*s.*
"Jingo-Ring," by Hugh Cameron, R.S.A. (1861), 11½ by 8, 115*l.* 10*s.*
"A Mayfield," by Sam Bough, R.S.A. (1859), 17½ by 11½, 57*l.* 15*s.*
"Pifferaro," by Robert Herdman, R.S.A. (1855), water-colour, 10½ by 14½, 20*l.* 9*s.* 6*d.*
"Cadzow Forest: Oak Trees breaking into Leaf," by Sam Bough, R.S.A. (1858), 23½ by 15½, 105*l.*
"The Fruit Seller," by Robert Herdman, R.S.A. (1855), water-colour, 14½ by 10½, 21*l.*
"Perch Fishing, County West Meath," by Erskine Nicol, A.R.A., 14 by 8, 78*l.* 15*s.*
"The Spring in the Wood," by Peter Graham, A.R.A., 25½ by 30, 58*l.* 16*s.*
"Naworth Castle," by Sam Bough, R.S.A. (1857), 17½ by 11½, 94*l.* 10*s.*
"On the Kelvin (autumn)," by John Milne Donald, 46 by 29½, 173*l.* 5*s.*
"The Italian Cradle," by Robert Herdman, R.S.A., water-colour, 15 by 10½, 28*l.* 7*s.*
"Herring Boats Going to Sea after a Storm," by Sam Bough, R.S.A., 35¾ by 23½, 84*l.*
"St. Dunstan and the Devil," by Sir W. Fettes Douglas, P.R.S.A., 29 by 24, 44*l.* 2*s.*
Portrait of Henry Mackenzie, Esq., "The Man of Feeling," by Sir Henry Raeburn, 24½ by 29½, 115*l.* 10*s.*
"Wild Cattle, Cadzow Forest," by Sam Bough, R.S.A. (1858), 35½ by 23½, 94*l.* 10*s.*
"Children at Play in a Churchyard," by W. M'Taggart, R.S.A., 10 by 8, 63*l.*
"Giovanella," by Robert Herdman, R.S.A. (1856), 27½ by 35½, 105*l.*
"Lahercost Abbey," by Alex. Fraser, R.S.A. (the cattle by Sam Bough, R.S.A.), 13½ by 6, 42*l.*
"Furness Abbey, Lancashire," by Sam Bough, R.S.A. (1856), 42 by 25½, 199*l.* 10*s.*
"Fishing Boats Running into Dysart," by Sam Bough, R.S.A. (1854), 35½ by 23½, 267*l.* 15*s.*
"A Castle near Kilmarnock," by Horatio M'Culloch, R.S.A., 15½ by 9, 28*l.* 7*s.*
"Lucy, the Woodman's Daughter," by Robert Herdman, R.S.A. (1867), 24½ by 29½, 147*l.*
"Landscape, North Wales," by Alex. Fraser, R.S.A., 18 by 9½, 58*l.* 16*s.*
"Fécamp Harbour, Coast of Normandy," by John Wilson, sen., 41 by 29, 29*l.* 8*s.*
"Canal Lock and Old Mill," by Alex. Fraser, R.S.A., 39½ by 21½, 109*l.* 10*s.*
"Sheep Shearing," by Sir George Harvey, P.R.S.A., 47½ by 29½, 126*l.*
"The Silver Cord Loosed" (the original of the well-known engraving), by Sir Noel Paton, R.S.A., 36½ by 27½, 168*l.*
"Inchcolme Priory," by Sam Bough, R.S.A. (1857), 35½ by 25½, 105*l.*
"A Harvest Rig in the East Neuk," by Hugh Cameron, R.S.A. (1862), 35 by 23½, 78*l.* 15*s.*
"A Salmon Weir on the Lledwyr," by Alex. Fraser, R.S.A. (1857), 23½ by 17½, 43*l.* 1*s.*
"Beside the Fountain, Italy," by Robert Herdman, R.S.A. (1856), 15½ by 24½, 78*l.* 15*s.*
"Scene on Hampstead Heath; London in the Distance," by Patrick Nasmyth (1818), 13½ by 9½, 115*l.* 10*s.* Besides the signature on the picture, there is on the back of the panel, in the artist's handwriting, "P. Nasmyth, one of his best bits, March 17, 1818."
"Bunyan with his Blind Daughter selling laces at the door of Bedford Gaol," by Sir George Harvey, P.R.S.A. (1857), 47 by 41, 157*l.* 10*s.*
"Moor Scene—Island of Mull," by Sam Bough, R.S.A., water-colour, 8 by 5, 21*l.*
"David's Evening Hymn," by Robert Herdman, R.S.A. (1858), 23½ by 29½, 210*l.*
"The Way to the Village—The Turf-boat, County West Meath," by Erskine Nicol, R.A., 50 by 33, 136*l.* 10*s.*
"Landscape—Evening," by Horatio M'Culloch, R.S.A., 15½ by 9, 45*l.* 3*s.*

The following four lots, by Sir George Harvey, P.R.S.A. (1858–59), illustrative of "Auld Lang Syne," are engraved by the Royal Association for Promotion of the Fine Arts:—
"We Twa hae Ran about the Braes," 29½ by 23, 57*l.* 15*s.*
"We Twa hae Paidl't in the Burn," 29½ by 23, 50*l.* 8*s.*
"But Seas between us Braid hae Rolled," 29½ by 23, 52*l.* 10*s.*
"We'll Tak' a Cup o' Kindness yet," 29½ by 23, 36*l.* 15*s.*

"Road Scene near Hamilton," by Alex. Fraser, R.S.A., 35½ by 25½, 110*l.* 5*s.*
"Dr. Guthrie Fishing in Lochlee," by Sir George Harvey, P.R.S.A. (1856), 47½ by 29½, 54*l.* 12*s.*
"The Trossachs" (water-colour), by Sam Bough, 14 by 12, 26*l.* 5*s.*
"Portrait of Thomas Carlyle" (the original), by Robert Herdman, R.S.A., 22½ by 26½, 78*l.* 15*s.*
"Portrait of Thomas Carlyle," by Robert Herdman, R.S.A.; in crayon, drawn from life, Chelsea, April 22, 1875, the study for the preceding portrait, 9½ by 14, 29*l.* 8*s.*
"Portrait of Sir Theodore Martin," by Robert Herdman, R.S.A., 24½ by 28½, 21*l.*
"The Falls of Kilmorack," by Rev. John Thomson, 53 by 33, 52*l.* 10*s.*
"Peeling Bark, Cadzow Forest" (water-colour), by Sam Bough, R.S.A., 14 by 10½, 21*l.*
"Ardargie Linn, near Perth," by J. H. Cranstoun, of Perth, 49½ by 39½, 24*l.* 3*s.*
"The Moor of Ferragon, Perthshire," by Sir George Harvey, P.R.S.A., 53½ by 29½, 65*l.* 2*s.*
"Crossing the Ford" (water-colour), by Sam Bough, R.S.A., 20½ by 13½, 27*l.* 6*s.*
"In Glenfalloch" (water-colour), by Alex. Fraser, R.S.A., 14½ by 10½, 21*l.* 10*s.* 6*d.*
"Coast Scene, Aberdour" (water-colour), by Sam Bough, R.S.A., 10 by 7, 21*l.*
"Logan Braes," by A. H. Burr, 39 by 32, 126*l.*

ROYAL HIBERNIAN ACADEMY.

THE annual report of the Council of the Academy for the year 1885–86 states that the Exhibition, which opened on Monday, March 1, and closed on Saturday, June 12, remained open fifteen weeks, during seven weeks of which it was open by gaslight at a reduced charge of 1*d.* It contained 609 works, against 572 in that of the preceding year, showing an increase of 37 works, and the Exhibition was considered much above the average in point of interest and merit. The season tickets numbered 510. The day admissions at 1*s.*, 4,947, and the evening admissions at 1*d.*, 16,467, and the Sunday admissions, for the six Sundays it was opened in the afternoon at 2*d.*, 768. The purchases amounted to 1,147*l.* 17*s.*, including those made by the Art Union prizeholders.

The following is an analysis of the attendance and receipts:—510 season tickets at 3*s.*, 76*l.* 10*s.*; 4,947 day admissions at 1*s.*, 247*l.* 7*s.*; 16,467 evening admissions at 1*d.*, 68*l.* 12*s.* 3*d.*; 2,391 catalogues at 6*d.*, 59*l.* 15*s.* 6*d.*; 2,844 catalogues (evening) at 3*d.*, 35*l.* 11*s.*; 768 Sunday admissions at 2*d.*, 6*l.* 8*s.*; 189 Sunday catalogues at 3*d.*, 2*l.* 7*s.* 3*d.*; commissions on sales, 59*l.* 14*s.* 6*d.*; total, 556*l.* 5*s.* 6*d.*

At the Council meeting of July 22, 1878, it was decided to offer annually an Albert prize of 20*l.* for the best picture, figure or landscape, painted by any Irish artist or student being under thirty years of age, who is, or has been, a student of the schools of the Academy. The pictures in competition were exhibited in the annual Exhibition of 1886. The prize was awarded to Mr. S. C. Cairnes.

The annual visit of the inspector from the Department of Science and Art, Mr. F. B. Barwell, took place on July 26, who, in conjunction with Mr. B. Colles Watkins, R.H.A., and the keeper, Mr. Vincent Duffy, R.H.A., made the following awards:—

Drawing from the Living Model—Silver medal, J. P. Moran; Bronze medal, Oliver Sheppard.

Drawing from the Antique—Bronze medal, J. C. Radcliffe: prize of 4*l.* best drawing from life, J. O'Reilly; prize of 2*l.* second best drawing from life, J. P. Moran; prize of 2*l.* best drawing from antique, J. O'Reilly; prize of 1*l.* second best drawing from antique, J. C. Radcliffe; prize of 3*l.* best study in painting class, A. Casciani; prize of 2*l.* second best study in painting class, C. E. Lodge.

EDINBURGH ARCHITECTURAL ASSOCIATION.

THE fortnightly meeting of this Association was held on the 2nd inst. A paper was read by Mr. J. W. Small, F.S.A. Scot., on "Old Scottish Woodwork." He reviewed woodwork in general from the earliest time, noting in passing the oldest in existence, being those examples of ancient Egyptian chairs, &c., preserved in the British Museum. Possibly the oldest representatives in Scotland of chairs are those depicted on the Celtic Dunfallandy Stone at Pitlochry. The War of Independence and Hertford's invasion of 1544 was one of the causes of the scarcity of woodwork anterior to these dates, although we can still point to the stalls, &c., at Old Aberdeen, Dunblane stalls, Foulis choir screen, old press at St. Andrews as having escaped the destruction of these bad times. A common error was pointed out of ascribing all old Scottish woodwork to foreign importation or workmen. He considered that was a mistake, and that the old woodwork was of native con-

ception and native construction. Having described a variety of existing pulpits, lords' lofts, and other ecclesiastical woodwork, the existing domestic work such as panelling of rooms, doors, shutters, boards, cabinets, presses, tables, chairs, chests, beds, and other miscellaneous articles, pointing out the characteristic Scotch features in their carvings and mouldings, he advocated the sketching of all old woodwork, and the sketch-book of the Association as the proper vehicle for such work. He described the invaluable use the study of old examples was to the modern designer, the variety and freshness of old examples, the barrenness and uniformity of modern design in consequence of the commercial view taken by the manufacturers, and their ideas of being able to grind designs out of their draughtsmen at high-pressure speed. He deprecated the sending of workmen to exhibitions at the public expense, and said the designers of the articles to be manufactured were the proper parties to be sent for such a purpose.

UNIVERSITY COLLEGE, LIVERPOOL.

A MEETING of the Council of University College was held on Tuesday at the Municipal Offices, Mr. W. Rathbone, M.P., in the chair. After reading the minutes of the last Council and senate meetings, the following letter from Sir A. B. Walker to the Earl of Derby, president of the college, was read :—

Gateacre Grange, near Liverpool :
December 4, 1886.

To the Right Honourable the Earl of Derby, K.G., President of the University College, Liverpool.

Dear Lord Derby,—It has come to my knowledge that there is urgent need for a building with efficient equipment for the engineering school of your college. I feel the importance of Liverpool having facilities second to none in the kingdom for the proper training and technical education of persons intending to enter the engineering profession. I am also very desirous of doing anything I can to promote the interests of the artisans of Liverpool and the neighbourhood, and I understand that one of the features of the engineering department is to give an opportunity for working mechanics to avail themselves of such technical instruction in the evening as the building in question will give facilities for. Such a building would also become the natural centre of the technical schools which are necessary to complete our educational system.

I shall esteem it a privilege to be permitted to defray the cost of such a building with the necessary machinery and appliances, to the extent of 15,000*l.* This sum Professor Hele Shaw informs me is ample to make the institution one of the most efficient in the kingdom.

I propose to ask the acceptance of this building as my gift to Liverpool to commemorate the jubilee of Her Majesty the Queen.—I am, dear Lord Derby, yours faithfully,

(Signed) Andrew Barclay Walker.

A sub-committee was also named to correspond with Sir A. B. Walker and others, with the view to the immediate formation of a building committee.

In answer to an application from Professor Conway, a grant of 100*l.* was made from the accumulated funds of the Roscoe Chair of Art for the purchase of additional Raphael reproductions, and for minor purposes connected with the department.

The Council passed a cordial vote of thanks to Mr. Malcolm Guthrie for his timely and generous gift of an iron building, which will provide a lecturers' room and two extra classrooms, and meet the very pressing want at present felt for increased accommodation.

THE PLEASURE OF CAST TAKING.

A SCULPTOR in St. Louis having arranged to take a cast of the head of Colonel Gilmore, that gentleman has given the following account of the operation :—"I went to the studio at the hour fixed, and was to be met there by a well-known sculptor, who had courteously undertaken to do the modelling himself. By some unfortunate mischance he failed to put in an appearance. Two apprentices were vigorously stirring the liquid plaster of Paris, or whatever villanous compound is used for the purpose. After about half an hour's waiting it was decided to proceed in the great man's absence, and I was invited to disrobe. A much-bespattered white sheet was wrapped around my neck and shoulders tightly, and my face and hair were liberally greased to prevent the plaster sticking to the flesh. Pieces of paper were stuffed into my mouth, nose, and ears, and I was told to shut my eyes. No sooner had I done so than my persecutors commenced pouring the liquid on my head. One poured while the other pressed the rapidly hardening compound so as to fill every recess and get a cast of every feature. They poured a great deal too much on, and soon my head was encased in a mask as hard as iron. The heat was insufferable. I could not move my head, for the awful weight threatened to dislocate my neck if I did ; my eyes seemed being pressed into my brain, and the paper circlets not proving adequate for their purpose, I began to feel the first symptoms of suffocation. I could not call out, and believed myself to be dying. But my troubles had barely commenced. The apprentices had not fixed the centreboard or slit properly, and when they mercifully decided to release me they found the cast would not come in half as it usually does. In a successful operation the two halves are joined together after removal, and a perfect reproduction of the face and head easily produced ; but in my case both dividing-board and grease had been overlooked, and the only course left was to smash the mask off. Mallet and chisel were used, producing an effect like concussion of the brain. Finally my face was freed, and I was able to breathe, and make a few remarks to the boys on their carelessness. Then it transpired that they had omitted to grease behind my ears, and the plaster adhered to the skin like glue. To remove the former, the latter had to be torn away, and when at last I got away I was a mass of blood and sores. After two weeks' medical attention I got about right, but the memory is still fresh."

EDINBURGH MUNICIPAL BUILDINGS BILL.

THE Bill to provide for the erection of Municipal Buildings in the city of Edinburgh, and other purposes, has been printed and circulated among the members of the Council. In the preamble it is stated that the present Municipal Buildings, which were erected in or about the year 1758, are now, and have long been, wholly insufficient, incommodious, and otherwise unsuitable for the conduct and requirements of the municipal and public business of the city. It is expedient, and would be of public advantage, that suitable Municipal Buildings in which to conduct and carry on the business of the said city should be erected and maintained by the magistrates and Council; and that the new Municipal Buildings should be erected on and adjacent to the site of the existing Municipal Buildings.

It is expedient that the magistrates and Council should be authorised to levy rates and assessments, and to borrow money, for the purposes of this Act. And whereas it may happen that the margin of assessment as limited by the Act of 1879, available for and applicable to the purposes of this Act, may not be sufficient for those purposes, it is expedient to amend the Act of 1879 with respect to assessments.

The magistrates and Council may, in the exercise of the powers, and in the execution of the purposes of this Act or any of them, stop up or interfere with, temporarily, all streets, thoroughfares, courts, passages, drains, water mains, gas mains and pipes, and telegraph and telephone wires and apparatus, they always providing a proper temporary substitute. The magistrates and Council may sell, lease, feu, or convey, in consideration of a price paid down, or of a yearly rent, feu duty, ground annual, or other annual payment, such portions of the lands and heritages which may be acquired by them for the purposes of this Act, but may not be required therefor; and may also sell such parts of any buildings which may be erected on any portions of the lands, on such terms and for such considerations as the magistrates and Council think fit.

Power is also asked whereby the magistrates and Council may let or lease from time to time, for such period and for such rent as they think fit, any part or portion of the Municipal Buildings or offices or other buildings to be erected under the authority of this Act, which for the time may not be required for municipal purposes, and the rents which may be obtained for such parts or portions so let shall be received by the magistrates and Council and applied towards the reduction of the annual assessments leviable or applicable by them respectively in virtue of and for the purposes of this Act.

It is further desired that the magistrates and Council may, during the erection of the Municipal Buildings and offices, and until the same are complete and ready for occupation, rent, hire, or lease such other premises as they may consider necessary for the proper conduct of the municipal business of the city and for holding the meetings of the Town Council, and for the accommodation of such of the municipal and other trusts as are accommodated within the existing Municipal Buildings, and may pay for such temporary premises such rents or other consideration as the magistrates and Council may think proper, and may fix the proportions of such rent or rents to be borne and paid by the several trusts accommodated in such temporary premises.

It is asked that the Act of 1879 be amended as follows :—"Section 66 shall be read and have effect as if the maximum rate of assessment, limited by the proviso thereof to two shillings in the pound of yearly rent in so far as regards the items specified under the first three heads of the said section, were as regards the said first three heads two shillings

and sixpence in the pound of yearly rent : Provided always that the Act of 1879, as so amended, shall, so far as applicable, extend to the Act of 1882, and to the Act of 1885, and to any other Act which may be passed in the present Session of Parliament, and to this Act."

THE MUNICIPAL ART GALLERY, LEEDS.

THE following letter from Professors Bodington and Miall of the Yorkshire College, appears in the *Leeds Mercury* :—

We have taken advantage of the opportunity now afforded to the inhabitants of Leeds of studying the plans of the new Municipal Art Gallery and Museum. It is desirable that all who take an interest in this new experiment should speak their minds without reserve, and therefore, although we are aware that our opinion on such a point can carry no special weight, we venture to congratulate the Town Council upon the result of the competition. The prize designs seem to us to embody a skilful treatment of a difficult site, and the new rooms will be spacious, well-lighted, and convenient. The sculpture gallery only (the present reading-room of the Free Library) is unsatisfactory, but we will not enter into the details of the proposed arrangement. We believe that the new buildings will be, on the whole, suitable to the purpose for which they are designed.

Shall we ask ourselves once more what that purpose is? Leaving the museum out of the question for the moment, we suppose that all will agree that the municipal art gallery is to be called into existence in order to make beautiful objects accessible to everybody. Some of us hope that by cultivating the sense of beauty it may be possible to increase our power of industrial production. Perhaps it may be of some use to suggest that the acquisition of beautiful objects is a slow and difficult matter. We must not expect great things all at once, for there are many competitors for every choice work of art, and the purchasing power of the Corporation will probably be limited. There is no harm in this if no unreasonable expectations are excited. But impatience may defeat the main purpose of the collection. We may be tempted to lower our standard of excellence in order to give an appearance of rapid progress.

It is instructive to call to mind how much has been done by small collections, even by single pictures. Some of our townsmen will know of the enthusiasm often created by one great picture in a little Italian town. How every one in the place prizes it ; how the waiters at the inn point it out as the one thing which no traveller should omit. We ought some day to have in Leeds two or three pictures worth travelling some distance to see, and even two or three would be enough to make their influence felt.

But an art gallery should not contain pictures only. We know what a powerful effect the little collection of old Venetian glass at Murano has had upon the revival of that beautiful industry, and how the important lace manufacture of modern Venice is to a great extent built upon a set of laces once belonging to an old Pope, and given to the cause of art manufacture by the Queen of Italy. Leeds is beginning to take an interest in certain industries which, like pottery, have points of contact with art, and it may be useful to point out that all such new developments can be powerfully stimulated by a very few things of high merit placed where all can see them as often as they please. If, on the other hand, we are led astray by the unwise ambition of making large collections, our standard of excellence will fall, and we shall know beforehand that no one will be the better for what we set before them.

The art exhibitions held some years ago in the Athenæum Buildings show us what happens when the managers have large rooms, and are afraid to leave blanks. Good works were occasionally hung ; but they were vulgarised by the exhibition side by side with them of productions of the lowest possible merit. It is of some importance, if we hope to benefit by the generosity of individuals who possess valuable works, to remember that they will not and ought not to consent to such treatment of fine things.

The Municipal Art Gallery of Birmingham furnishes an excellent instance of collections which are managed with a scrupulous regard to the best interests of art. The purchases made by the trustees of the Public Picture Gallery Fund have been few, but the pictures bought have been characteristic examples of first-rate contemporary work. An equally high standard has been maintained in regard to the acceptance of donations. The result of this policy is that Birmingham already possesses an art gallery of which its citizens are justly proud.

We believe that the Town Council will shortly be called upon to decide what it will accept. No doubt there will be those who will urge that second-rate pictures are better than nothing, that the walls must be covered, that offence will be taken if gifts are slighted. If the Council yield to such arguments, we shall soon know that our art gallery has fallen into wrong hands. We hope that the public will insist upon a high degree of excellence in any picture which is accepted by the town, and will cheerfully endure for a time bare walls illuminated here and there by an example of first-rate work.

Our chief anxiety is not about the loan collections, but the permanent gallery. We may gain experience by the collection for temporary exhibition of works of small importance. Even the loan collections, however, should be subjected to some degree of careful selection. The municipal exhibitions of which we have recent experience cannot be considered altogether successful if judged by truer tests than the number of the pictures shown or the number of the visitors.

A wealthy town like Leeds will not depend entirely upon the gifts of individuals, though it will naturally hope to benefit by that generosity which has enriched so many public collections. The judicious expenditure, not in very small sums, of an annual appropriation seems to us essential to the creation of such an art gallery as will have an educational power.

Our main object in addressing these remarks to our fellow-townsmen is to induce some of them to inquire what has been done in other towns and other countries to educate the industrial artist. The results of a good deal of enlightened experiment are accessible to us, and we ought to profit thereby.

DISTRIBUTION IN DESIGN.

THE second of his course of lectures in the Yorkshire College on Design was delivered by Mr. Lewis F. Day on Wednesday, the subject being "Distribution in Ornamental Design." He reminded his audience that in his previous lecture he laid down the lines upon which repeated pattern work can be constructed, to show the comparatively simple plan on which the manifold forms of surface ornament are built up, and the very limited range of lines on which patterns can be built. On this occasion he had to discuss the lines on which ornament, not necessarily repeated, could be distributed. The first thing one had to do in designing was to determine the lines on which the design shall be distributed. The more clearly the designer realised to himself the lines on which it was open to him to proceed the better, and if it could be shown, as he thought it could, that those were comparatively few and simple, so much the easier would it be for him to make up his mind promptly which of them he would adopt. The shape of the actual space to be filled would oftentimes determine for him more or less the distribution of his design. That was to say, it might very likely render certain schemes altogether unavailable, and perhaps even limit his choice to a single plan; but at the very first he was limited, in the nature of things, to certain methods of procedure. Taking the simple parallelogram (which might stand for panel, page, floor, ceiling, window, door, façade, carpet, curtain, shawl, &c.), the lecturer proceeded to show the possibilities with regard to the distribution of ornament over its surface, and then to explain how the same principles applied no matter what the shape to be fitted. Given a panel to be filled, the designer might start from the centre or from the edge—that was to say, he might occupy the field or centre, and work outwards to the margin, or he might begin with a border, and work inwards. The border once defined, the space within remained to be treated. But a border might be of such interest that nothing further was needed. Especially might this be so if the material in use were in itself of some interest. It was distinctly not desirable to mar the surface of beautiful wood or rich varied marble with added ornament. Generally in woodwork it resolved itself into a question of whether the panels or the mouldings bordering them should be enriched. If the idea of a border were to be adopted, the simplest thing to be done was to keep it of one uniform width on all sides. And it made all the difference whether it was simple or elaborate in character. A very deep, rich border had such an entirely different effect from a moderately simple one that it looked something like a different treatment altogether. Borders should be so schemed as to give panels of proportions suitable to the filling proposed for them. The use of border within border as a deliberate means for ornament was common enough. Border might even be added to border until the whole of the field was occupied. Equality of width was by no means essential to a border. Nor need the border necessarily be continued all round the space. Something like a new departure occurred when the border invaded the field or centre of the panel, as it very often did in French Renaissance work—sometimes to such an extent that little or no further decoration of the field was necessary. The Japanese were in the habit of allowing the filling pattern, whatever it might be, to break over the margin or border just as the impulse prompted. This was a proceeding which might or might not result in confusion, according to the relative strength of the border and the pattern that cut across it. One appreciated this kind of freak as a relief from the monotony of formal disposition, but it was not a thing to indulge in very freely. It needed always to be justified by some excuse other than the artist's impatience of order. As to the construction of the border, it might be continuous or broken, and broken at all manner of

intervals and in all manner of ways. It might flow or grow; it might be symmetrical or absolutely free; the outer or the inner edge might be accentuated, or both or neither; it might spread outwards from a well-defined central feature, or inwards from the margin, diffusing itself and giving a less definite central shape. If the space to be decorated were very considerable in extent, it was often necessary to cut it up into sections otherwise than by merely marking off a border. A wall, for example, was divided into cornice, frieze, wall space, dado, and so on. Or it might be divided vertically into panels of equal or unequal width. The use of the border was not, of course, confined to the outer edge of the main space to be filled. Each sub-section of the design might be provided with its own border. A design was in harmony, not when it was strictly according to Greek or Gothic precedent, but when the parts all fitted. Suppose, for instance, the lines led up to some prominent feature, that feature should be of sufficient interest to justify the attention called to it. Any feature, such as a tablet, medallion, label, cartouche, shield, and so on, introduced into a composition, should bear relation not only to its surroundings, but to what it was to enclose. In conclusion, the lecturer showed that the principles upon which all manner of shapes may (and indeed must) be filled in are much the same.

CHURCH BUILDING AND RESTORATION.

Wolferton.—The church of St. Peter, which parish forms a part of the Norfolk estate of the Prince of Wales, was reopened on Sunday evening, after having been closed for about twelve months for repairs, which have been carried out at the sole expense of His Royal Highness. Portions of the building indicate the existence of a church of considerable size and importance as far back as the early part of the thirteenth century. In the latter half of the following century the church assumed its present form, when the tower was built, and the plan probably enlarged by the extension of the aisles and chancel. The south porch is of the same date, the clerestory and the roof of the latest Gothic period. A great fire appears to have taken place in the church four hundred years ago, and since the Reformation much damage has been done in the church and much valuable work destroyed or improperly removed. Among other things which have thus disappeared are the old pulpit and the font cover, which is said to have been a pyramidal one of an elaborate character. The wood screens and those surrounding the chapel at the end of the north aisle are of late date, but those enclosing the south chapel belong to the middle of the fourteenth century, and are unique in richness and beauty of design and masterly execution. It is evident that these screens were never made for the position they now occupy, and that they must have been brought here from some building of great importance and magnificence. The remains of the chancel stalls were in existence before the restoration, but much altered and mutilated. All remains of the old nave seats had disappeared, and the levels of the floors had been altered more than once, and almost hopelessly confused. The walls were thickly coated with whitewash, and all traces of the old decoration hidden from view where it had not been previously obliterated. The pews were deal boxes of the meanest character, and were arranged with no regard to order or architectural effect. Various works had from time to time been undertaken by the late rector, including the rebuilding of the vestry on the walls and foundations of the old sacristy, the restoring of the east windows and the rearranging of the chancel. The present restoration has been carried out consistently with the requirements of the services of the Church. The magnificent roof of the nave has now been restored to its original proportions and construction. New roofs have replaced the mean modern ones on the aisles and chancel; an organ chamber has been added on the north side of the chancel, and a new organ, built by Messrs. Henry Willis & Son, placed therein. The whole of the stonework inside and outside has been carefully repaired. The floors have been restored as far as possible to the original levels, the font placed in its old position and properly raised; oak benches have been placed in the nave, and all the screens have been repaired with the greatest care. The ancient wood gallery with its groined soffit springing from the screen has been restored with admirable effect, and the steps to it have been opened out and repaired. A handsome stone pulpit, the special gift of the Prince of Wales, has been placed in the nave. During the works of repair and cleaning some very interesting remains of mural decoration were discovered over the chancel arch. An angel with outspread wings stands on each side, holding a banner, on which emblems of the Passion are represented, while angels flying downwards are represented as blowing a blast on trumpets. The only colours used are red, yellow, and black, on the white plaster. The whole of this painting has been preserved by very carefully removing the coats of whitewash with which it was covered. The work of restoration and repair has been carried out under the direction of the architect, Mr. A. W. Blomfield, M.A.

GENERAL.

Mr. W. H. Houldsworth has lent *The Rescue of the Heretic* painted in 1857 by Sir John Millais, to the Kilmarnock Exhibition. The subject is the rescue of a girl from a cell of the Inquisition by her lover, who has assumed the robe of a monk.

Mr. J. W. Tonks prepared the designs for the mayoral chain, mace, and seal which are about to be presented to the new borough of Wednesbury.

Mr. T. Hawksley, C.E., is to be asked to report on the scheme for laying a second water main through the valley of Strathmore, a distance of seven and a half miles, at a cost of 45,000*l.*, in order to increase the water-supply of Dundee.

Mr. J. A. Reeve designed the memorial screen which has been placed in Waltham Abbey Church by the admirers of the late Rev. J. Frances.

Mr. Charles W. Deschamps, who served in a similar capacity at the last Paris International Exhibition, has been appointed Fine Art Superintendent of the British section of the forthcoming Jubilee Exhibition at Adelaide.

Messrs. Cawston & Graham, of London, have obtained the first prize (100*l.*) in the competition for the Carlisle Market. The cost of their designs is 19,200*l.* The second prize (50*l.*) was awarded to Mr. G. D. Oliver, of Carlisle. There were 35 competitors.

Lord G. Hamilton on Tuesday delivered the prizes to the students of the Chiswick School of Art in Bedford Park, and delivered an address to a large assembly.

An Exhibition of the works of James McArdell, the mezzotinto engraver, is open at the Burlington Fine Arts Club in Savile Row.

The Leamington School of Art is to be reopened, with Mr. Donald W. Robertson for master. It will be carried on independently of the Free Library committee.

An Architectural Room now forms part of the Walker Art Gallery, Liverpool. It was opened on Monday. It contains many casts of French work from the Palace of the Trocadéro, the Union Centrale des Arts Décoratifs, and the Palace of the Louvre. Afterwards copies will be added of the photographs of historical monuments prepared at the instance of the Minister of Fine Arts in France.

Architectural Books were sold by auction in Edinburgh on Saturday. The following were the principal:—Britton's "Architectural Antiquities of Great Britain," 8*l.*; Britton's "Cathedral Antiquities of England," 10*l.*; Billings's "Baronial and Ecclesiastical Antiquities of Scotland," 11*l.* 11*s.*; Nash's "Mansions of England in the Middle Ages," 14*l.* 3*s.* 6*d.*

Mr. F. W. Albury, of Reading, has obtained first place in the competition for the Slough Public Hall and Leopold Institute, on the report of Mr. T. R. Richards, the assessor.

The Annual Election of members of the Glasgow Art Club was held last week, when Messrs. J. J. Burnet, James Sellars, R. Macaulay Stevenson, David Thomas, I.A., John Henderson, John O. Campbell, J. Denovan Adam, A.R.S.A., John Macniven, and E. A. Hornel were admitted.

A Public Company is being formed in Wakefield for the erection of a public hall to accommodate 2,100 people, at a cost of 5,500*l.* Messrs. Simpson & Richardson, of Wakefield, have prepared designs.

The Society of Civil Engineers (Ireland) has awarded a gold medal to Mr. W. Greenhill for a paper on "Creosoting Timber." Silver medals were awarded to Messrs. H. V. White, F. K. Wilson, John Moylan, and W. R. Maguire.

The Purchasers of Staple Inn announce that while they cannot bind themselves to preserve the property in its existing condition, they have at present no intention whatever of altering the garden or the elevation of any of the buildings.

The Girvan and Portpatrick Junction Railway was sold on Friday, in Edinburgh. The price given for the whole undertaking, exclusive of plant and rolling stock, was 155,000*l.* The directors are bound not to disclose the name of the purchaser.

The Blind Asylum, in Castle Street, Glasgow, lately erected in the Scottish baronial style from the designs of Mr. William Landless, was in part destroyed by fire on Friday last. The rebuilding will cost over 8,000*l.*

The Peterborough Cathedral Restoration Committee have issued a special appeal to the public in general for aid to complete the necessary works of the sacred edifice, their funds being exhausted. A sum of 24,000*l.* has been contributed and expended, and 47,000*l.* will still be required.

The Old Burgh Cross of Lochmaben is to be restored and re-erected in the High Street near the statue of Bruce. It is recorded that at the time Elshieshiels Castle was built some of the building materials were left unused, and, Lochmaben being without a cross, the Town Council, as the price of these materials for building the cross, made over to the laird of Elshieshiels, his heirs and successors, the mill and mill lands of Lochmaben, part of the burgh property. The property forms part of Elshieshiels estate to this day.

The Architect.

THE WEEK.

THE principal event of the week, at least for architects, is the appearance of Mr. CHRISTIAN'S report on the Liverpool Cathedral designs. It is a model of what a document of that kind ought to be. Sufficient information is given to aid a committee on technical subjects, and the reasons for the author's preference are frankly explained. Mr. CHRISTIAN evidently admits that there are grounds for the objection to the site, although, as a good Churchman, he must desire to see the building so placed that it may symbolise the triumph of ecclesiasticism. It would no doubt be satisfactory if the new cathedral became an everyday refuge to the merchants of Liverpool; but is there not an exercise of imagination when the "bright example" of St. Paul's is cited? If the sightseers were eliminated from an afternoon service, there would be very few worshippers left to represent 'Change or the neighbouring warehouses. It is, however, useless to again go over the objections to placing a lofty building alongside St. George's Hall; the promoters of the project will have no other site. Mr. CHRISTIAN considers that Mr. EMERSON'S designs should take first place, and so much originality merited such a recognition. It is, however, admitted that Mr. BROOKS'S plan is very fine, and credit is given for the triforium gallery, and other features. The design is rightly described as powerful, and in many respects as very beautiful. The praise of Messrs. BODLEY & GARNER'S design is rather qualified, but justice is done to the central lantern. The report justifies the anticipation. It was generally supposed that Mr. EMERSON would have first place. It would, we suppose, be more satisfactory to the winner if the prize had been gained in a less restricted competition.

WE publish this week an illustration of the historic Château de Langeais, and, by a curious coincidence, the whole week has been occupied in Paris with the sale of the contents, which were of only secondary interest to the building. The collection might belong to a museum. Among the marbles are a bas-relief attributed to DONATELLO and a bust by LEMOINE. There are examples of sculpture in wood of the sixteenth and seventeenth centuries; furniture of the seventeenth and eighteenth centuries; bronzes, arms, and pottery of all schools, including those of China and Japan; with tapestries, embroideries, and paintings. The auction season begins earlier in Paris than in London, and the sale of the collection of the Château de Langeais is as yet its most memorable event.

THE paper which was read by Mr. W. H. SETH-SMITH at the meeting of the Society of Architects on Tuesday was a plea for federation. He maintained that if a Registration Act were obtained, it would not override the chartered privileges now enjoyed by the British and Irish Institutes, or, in fact, the powers of any other architectural body to test in whatever manner or degree it might desire, the qualification of candidates for its own membership; the provisions of the Act would relate solely to the qualification for practice. The principal object of those who desired that such an Act of Parliament should be passed was the creation for the use of the public of a competent body of architects. The second great object was the production and annual publication, likewise for the use of the public, of a register, giving name and address and qualification of all persons duly qualified to practise in architecture, and to enable the public to distinguish qualified from unqualified men. A third object was to establish an exclusive right to the use of distinctive professional titles. A fourth was to confirm the legal rights of architects to recover fees, and a fifth to exempt architects from serving in any public offices, parish offices, on juries, or in the Militia. Mr. SETH-SMITH proposed that the authority to administer the Act should be entrusted to a body consisting of representatives from the Royal Institute of British Architects, the Royal Academy, the Royal Institute of Architects of Ireland, the Institution of Civil Engineers, the Institute of Civil Engineers of Ireland, the Society of Architects, the Society of Engineers, the Surveyors' Institute, the Architectural Association, and one representative from the Scotch Architectural Societies, the Universities, and such other colleges and learned societies as it may be found desirable to represent; and six persons to be nominated by HER MAJESTY, with the advice of her Privy Council—four for England and Wales, one for Scotland, and one for Ireland, with power to add to their number. At least one-half of the members of Council to be architects. Members of Council to be paid fees for attendance and travelling expenses. He believed that as soon as the Act came into force the compulsory education of the entire profession would commence. The proposed Act should provide means for fining persons who acted as architects without being qualified; it should also provide that unregistered persons should not be entitled to hold Government, municipal, parochial, or other public appointments, and that they should not be able to recover fees.

MR. F. R. FARROW, the assistant librarian, announces that documents have been discovered among the archives of the Architectural Association which show that on September 1, 1842, the society was instituted as the "Association of Architectural Draughtsmen." Afterwards, in 1847, it was reconstructed under its present title.

ART is not without its mysteries, and one is to be found in the galleries of Messrs. WINCH, in Bond Street. It takes the form of a version of the *Sistine Madonna*. The history of the picture cannot be traced, and the owners have very wisely refrained from inventing one; they leave the picture to speak for itself. It bears a close resemblance to the picture which is now in Dresden, but there are variations in detail which are not to be explained. The *Sistine Madonna* was subjected to the operations of the restorer, and if it were said that the Bond Street picture was a copy of the picture in a former time, there would be grounds for the assertion. It is evident, however, that the copy was made by no servile hand. There is not as wide a departure as is to be found in RUBENS'S copy from DA VINCI, but one of the good qualities of the work is that it suggests the painter's individuality. Apparently he was a more virile artist than RAPHAEL. But there is much in it which seems to be the work of the great master. It is rare to find so important a picture without a name, and Messrs. WINCH deserve much credit for so honest a mode of exhibition. We may add that the picture can be seen without the visitor being pestered with applications to subscribe to a reproduction.

AN effort is being made to secure the remaining part of the Archbishop's Palace at Croydon, in order to preserve it from degradation by converting it into a public library and museum. On Saturday a meeting of the friends of the project was held on the premises, when Mr. LOFTUS BROCK read a paper on the architecture and the historical associations of the structure. Mr. BROCK showed that the chapel, which is of Tudor date, stands on the site and foundations of an earlier building. The great hall is of considerably older date, and contains the armorial bearings of Archbishop STAFFORD, who erected it, on its walls, and the corbels which support the timber of its fine open roof. The entrance to this hall, at its north-eastern angle, is more than half a century older. Queen ELIZABETH must often have sat as a Royal guest in the hall, and so probably did JAMES I. of Scotland, who spent some years as a prisoner there in the time of Archbishop COURTENAY, and Queen MARY once at least held her Council there with Cardinal POLE at her side. Queen ELIZABETH'S bedchamber still remains substantially the same as three centuries ago, though its panelling and its ornamental ceiling have disappeared. The long gallery, which runs along the entire southern side, the exterior walls of which were cased in red brick by Archbishop WAKE, is of special interest as being the place in which Queen ELIZABETH is said in history to have bestowed the Great Seal of the Lord Chancellor on the handsome Sir CHRISTOPHER HATTON in 1587, just three centuries ago; and it is very little altered since that day, though partitioned off in order to make modern bedrooms.

ENGLAND'S CHRONICLE IN STONE.*

IT is said to be one of the misfortunes of the United States that the country can show so few things which are old, but the deficiency has increased the number of students of English and European remains. If the Americans possessed buildings of a remote age, like those of France or England, they would probably care as little about antiquity as the majority of Englishmen and Frenchmen. In France it was found necessary to create a public department to keep historic buildings from destruction or from a metamorphosis that was almost as fatal. In England a protection of the kind is no less needed. The Americans happily have no temptation to become destructive, and it is only natural that they should prize what the past has left to us in England. Moreover, as they are not called upon to inquire into the necessity for altering or removing what is ancient, it is not surprising if they regard an alteration of an old church or house by a modern builder as if it were profanity towards a relic.

"England's Chronicle in Stone" is a book by one of the numerous Americans to whom English buildings are endeared as part of a great heritage. Mr. HUNNEWELL, the author, tells us he has made no less than a dozen tours through the country, and his book is made up from the remarks entered at the time in his note-books. He has also possessed himself of over ten thousand plates, and out of them he has made a selection, which are reproduced in his book. They are diverse in character, ranging from INIGO JONES'S sketch of Stonehenge to the map compiled for the Society for the Diffusion of Useful Knowledge. The volume is consequently a pleasant record of travel in England, which can be read with interest by residents as well as by tourists. The friendly spirit in which the book is written may be judged from the following passage:—

> Anglomania may affect persons, but there is not much danger that it will too much affect the American people. It is another matter to see and to read the chronicle in stone which England shows us, and some of our pleasantest days can be those spent in drives or walks on her hedge-lined roads, in strolls on charming footpaths or under the ivy-grown walls of her castles and gray cathedral towers—days the writer feels he lives again while his pen moves over these pages; and a mild, hazy sunshine seems to light the way, as he often has found it brightening the exquisite old island.
>
> If the world is losing charms of the past, and we cannot but feel a regret at the loss, it is in the main much improved. Causes which have estranged great families of the English-speaking races gradually have less, or no, influence. Plain sense, sound political economy, and devotion to progress and freedom among all of them, prompt to good work for the present and future. What they have to do together to make the world better has been already done well, but their work is as yet little more than begun.
>
> We have no regard for persons who take our ancestors from their true relations of time, place and thought, and try to show that they were bad or ignoble, but who feel that fairly judged they were in their own day, with all which belonged to it, never surpassed by the founders of any nation on earth, and can in the same spirit read the story of the people on the old island. Like our own people, led through trials and triumphs to marvellous success in the end, meeting reverses but never actually conquered, comparing well with any other in their successive ages, they now, like us, have an ancestry they can be glad of and proud of, to be treated with justice and held in due honour.
>
> The stone chronicle of England cannot be read well by eyes other than those which look with sympathy on the men of the past and the work of their hands. To such eyes the gray text will show the great story it holds, garlanded with the bright daisies, green hawthorn or ivy, and red-berried holly, which the old painters loved and drew on the leaves of their books, but which, in the monumental record of England, spread around the stone letters a beauty given by no mortal hand.

When an author begins in such a strain there is no likelihood that he will be captious. Mr. HUNNEWELL is a writer who takes a pleasure in rambling through England, and, unlike his countryman HAWTHORNE, he tries to look at the best side of whatever is presented to him. He begins by a description of the island, which might have been inspired by EMERSON'S chapter. The first record in his chronicle is, of course, Stonehenge, and which he calls "the wreck of a once vast Westminster Abbey of the ancient Britons, that imagination only can reanimate." But he does not attempt to suggest how the great stones were brought to Salisbury Plain—a problem which EMERSON appeared to think offered no difficulties since as big were moved about in Boston. About Roman Britain Mr. HUNNEWELL writes at length, and he cannot understand why so little is done towards the exploration of the remains. Saxon England has not bequeathed much to gratify the eyes of American tourists. Mr. HUNNEWELL refers to only one work, the Earl's Barton Church, but he consoles himself for the absence of architecture with thinking how it was in the Saxon period "an English people had been gathered and established in its home, and that the deep foundations of their character and power had been laid." The architecture of the Normans on the contrary has contrived to survive, and Mr. HUNNEWELL is not sparing in his admiration of it. He grows enthusiastic over Windsor Castle, and the Albert Memorial Chapel he considers to be the most sumptuous and beautiful in England. It is, however, rather startling to find it said that "the mirror-like mosaic pavement is fit for the table-cover of a drawing-room!"

It is the fashion of late to trace the influence in works of every kind of what is called national character, and which in England is supposed to be of a very composite kind. Mr. HUNNEWELL follows in the wake of many travellers. Even in the architecture of the cathedrals he sees evidence of the spirit which at one time made the English penal code be worthy of the Anthropophagi. "The brutality," he says, "that far too much marked English character a hundred years or more ago, revealed in so-called discipline at sea, in public institutions, in the treatment of miners, and of children in factories, with all the exasperating and disgusting detail, is revealed in different but as striking ways by the excrescences inflicted on cathedrals, and such outrages as those inflicted on the Chapter-house at Durham or the ancient glass at Salisbury." These words will not be generally endorsed, but they will at least be satisfactory to the members of the Society for the Preservation of Ancient Buildings. It might be supposed that as America is able to be moral without any imposing cathedrals, a traveller from that country would apply an utilitarian test to the English buildings, and say that their day was gone. The development of machinery has not, however, banished the susceptibility to what is poetic and imaginative from the American mind, if we are to take Mr. HUNNEWELL as a representative of the country. His reasons for attaching importance to the English cathedrals are the following:—

> No mere dull antiquarianism leads us through these edifices, but warm sympathy with men whose genius and devotion, shown in many periods, have left works wrought by their hearts and souls as well as hands, and so expressive of their character that we can through these hold intercourse with the builders. One who does not feel a sympathy with them, with what they felt, and what they tried to do, will lose much of the pleasure to be gained in these churches; one who disbelieves, or only cares to gaze coldly, will find that the town outside is pleasanter. As features of the human face are few yet endless in variety, so are those of cathedrals. One can never see all their diversity and expression. Every moulding, corbel, cusp, and capital is full of meaning of some sort, and still more are the sculptured altars, telling of immortal life, and the carved tombs and lettered stones around them, telling how mortality blends with it when the glories that the splendid shrine pre-figures will no longer be unseen. Around these venerable cathedrals the history, character, and sense of beauty of the people with the power and grace of the deep faith of England appear in forms that are visible, making all they embody real to us, and the land fairer and more lovable and precious. The hearts of the builders have been English, and they have built each throb in with the stones wrought to make shrines that have long kept, and, we may hope, will save for all time, the unique record of the steadfast piety and wise endurance that have made the small, wild island become the throne of the world-wide empire, telling its people of this every day, and that the nation's strength and glory will endure while they, like what they signify, remain secure.

It is easy from such a prelude to imagine how the English cathedrals are described by Mr. HUNNEWELL. In writing of the Salisbury restorations, he says that England at one time "had grown stupid, cold, and wicked; she overworked her children, bought slaves, and tried to tax

* *England's Chronicle in Stone. Personal Observations of Cathedrals, Churches, Abbeys, Monasteries, Castles, and Palaces.* By J. F. Hunnewell. London: John Murray.

America. Then judgments came upon her, and among them was a man named JAMES WYATT." The unhappy architect will henceforth never be allowed the mercy of oblivion. But Mr. HUNNEWELL has a very different opinion about our modern restorations. Indeed, when describing Exeter Cathedral, he says that "ancient and modern ecclesiastical art are worthy of each other." St. Paul's, he thinks, would be the better for "a thorough washing." He admits the impressiveness of the building, and, like THACKERAY, he believes there are few scenes in this world to equal a celebration in it when the charity children are present. EMERSON singled out York Cathedral as the one which is most impressive, and Mr. HUNNEWELL also appears to be of the same opinion.

After describing the cathedrals Mr. HUNNEWELL next takes up the monastic remains. Distance is more effectual than time in softening prejudices, and, like other Americans, he does not glory in the dissolution of monasteries under HENRY VIII. Indeed, no one who considered the difference between the art that preceded the Reformation and the art that followed the experiment could well do so. "Read the catalogues of some of these collections," says Mr. HUNNEWELL, and apparently he is of Puritan descent, "read the testimony of JOHN BALE himself, find what these gathered treasures were, hear the apologists of barbarism, and then feel a righteous indignation at one of the most disgraceful passages in English history." And he quotes BALE, who had a hand in the work, and who said :—"I judge this to be true, and utter it with heaviness, that neither the Britons under the Romans and Saxons, nor yet the English people under the Danes and Normans, had ever such damage of their learned monuments as we have seen in our time." The buildings selected for description are Glastonbury, Fountains, Bolton, Kirkstall, Whitby, Selby, Lindisfarne, Tynemouth, Hexham, Furness, Tintern, Netley, and Malmesbury. Mr. HUNNEWELL is also compelled to make a more restricted selection when dealing with the parish churches. As he says, "only a very large book, wholly devoted to the subject—one hardly yet written—could contain adequate and classified accounts of all these churches." They are prized by him not only for their architectural interest, but for their historic associations.

The secular buildings begin with the castles. The restoration at Cardiff occupies a page, but there is no illustration of this most interesting work and no mention of its architect. It is said, however, that the castle now has a completeness, picturesqueness, and grandeur almost unique in Wales, and suggestive of the great French restorations of Mediæval civil edifices. The University buildings and public schools follow the castles, and then come descriptions of some of the larger mansions; finally we have the town-halls and civic buildings. In speaking of the Birmingham Town Hall there is one obvious misprint. It is said to have been erected from a design by HARRIS. The building was designed by the late Mr. JOSEPH HANSOM, and an unfortunate commission it was for him. He and his partner were compelled by the committee to become sureties for the contractors, and, in consequence, lost all they possessed. The building cost over 30,000*l.*, while the contract price was 17,000*l.* When difficulties arose, another architect wormed himself into the confidence of the committee, and tried to get the credit for the work by posing as architect for a short time. Hawks may not pounce on hawks, but architects will pounce on architects whenever misfortune gives the opportunity.

Mr. HUNNEWELL concludes with an earnest appeal to Englishmen, urging them to the preservation of the structures which have survived the vicissitudes of centuries. One paragraph may be given :—

> First of all is the importance of the preservation of these works. They are priceless to England, and precious to the people spread about the world and speaking her language. Changes throughout the country are growing more positive and evident. The real or supposed needs of increasing trade and population crowd upon the rural districts and transform the towns, so that the temptation to injure or destroy the old landmarks is constant. But once lost to the country, no power can ever replace them. Hedges and daisies, fine turf and old trees are not fresh again where the cinders and smoke of the mill or the colliery have taken their places; and even far more improbable would be the regaining of any part, however humble, of the long stone chronicle of the English people. They, of all ranks, have made it, have paid for it also with their best thoughts, their treasure, their heart throbs, and even their blood. No reproduction can ever give for ages to come a hint of that record when once it is lost; and, if this thought needs help, surely wise men are apt to take care of what they have earned and still hold, and a great cost is not got back by destroying the property. It may seem as if one who lives far away need not urge that a people spend means and labour to save their old stones; but England with all she is has grown to exist not for herself alone. If care and expense be her lot with her treasures, she holds the old homestead, and with a fair fortune. Hers is the roof tree, the hearth-stone, the hall with the portraits; and from the wide world the cousins, sometimes much removed it may be, do turn as only a touch of kindred can make them, glad and perhaps a bit proud that the old line has still the old place. They would be sorry to see it ill-kept; they like to see it so fine, as it is.

This is an entreaty which is worth the attention of many among us. It certainly is gratifying to know that people who are far apart and engrossed with material pursuits have a yearning to preserve the objects on which their ancestors may have looked. It is, however, only another instance of that combination in the English race of qualities apparently opposite which is such a puzzle to strangers. Mr. HUNNEWELL'S book, although written in Charlestown, is an expression of sentiments that are thoroughly English, while as a message of goodwill from beyond the Atlantic it is especially welcome at this season.

MR. CHRISTIAN'S REPORT ON THE DESIGNS FOR THE LIVERPOOL CATHEDRAL.

THE report on the three designs for the Liverpool Cathedral by Mr. Ewan Christian has appeared, and is as follows :—

My Lord and Gentlemen,—Having now, in accordance with your instructions, completed the examination of the designs submitted by architects in competition for the proposed cathedral, I beg to present for your consideration my report thereon.

I regret very much the delay that has occurred in its preparation, but it was quite unavoidable by reason of the effects following a severe attack of illness early in the year, from which I did not fully recover until after an entire and prolonged rest in Switzerland.

Since my return I have lost no opportunity of proceeding with the work, and now propose to put before you the results of my examination.

I may say generally that the competitors have in all essential matters complied with the requirements of the instructions issued to them for guidance in preparing their designs, and have done, indeed, more than could be expected of them in preparing the beautiful drawings submitted for your consideration.

Before entering on the principal subject of my report, and describing so far as I am able the respective merits of the designs, I think it may be useful to say a few words on the question of site. I cannot but be aware, as must, indeed, be inevitably expected, that strong and different opinions are held upon this point. There are those, I believe, who think that a striking position is all-important, and there are others who think that a cathedral should stand in a large open space, and that whether near or far away from the great centre of population is a matter of only secondary consideration.

The men of former ages rarely acted upon such views. Excepting St. Peter's at Rome—the reasons for the comparative isolation of which are obvious enough—and the cathedral at Pisa—a great monument for which with its adjacent buildings open space was a necessity—almost all cathedrals in large cities with which I am acquainted are to be found in the midst of the people they were intended to serve; the crowding round of houses and other buildings was little regarded, but the cathedral was a necessity of the daily life, and a central position was therefore of paramount importance.

That the cathedral church of a great commercial city should stand in the very heart and centre of that city is, to my mind, an axiom of the most evident truth and very highest importance; that it should be a central gathering-place for all classes, high and low, rich and poor; a place of prayer, open at all hours for those whose homes deny them the privilege of silent meditation; where the busy merchant can divert his mind for a while from the pursuit of material wealth to welcome the higher thoughts of life when passing to his place of business; where the voice of prayer and praise may be heard amid the busy din of traffic, and strong truths be spoken to those who need to hear them; that these privileges should be always nigh

at hand and be capable of being made a portion of the daily life of a great city, is to my mind of far greater importance than that it should be considered as a mere architectural monument, a thing of beauty for educated people to admire and for the rich to worship in.

That a cathedral may be so used St. Paul's, in London, is now a bright example; that it might become dead and comparatively useless is, alas! too true; but a building like a city set on a hill cannot be hid, and in the bright light that would blaze upon it in the centre of multitudes, there would be less risk of failure than when lost to view in more quiet portions of the town.

That the site is one of difficulty cannot be denied; that it is capable of considerable improvement, if the municipality think fit to deal with the adjoining properties in a large and liberal spirit, cannot, I think, be doubted, and if a high level roadway from Dale Street were at any time to be effected, an opportunity would be afforded of combining with a cathedral so placed all the best buildings of the city, and of making an approach such as very few cities could surpass. That all this is possible is in my opinion certain; whether it is probable is not for me to conjecture or determine.

As regards the effect of placing so large a building in close proximity to St. George's Hall, I would say that although as regards the principal front and ends St. George's Hall is a noble example of design in Greek architecture, yet unfortunately it partakes of one of the vices of the age, in that while wealth is exhibited where it can be prominently seen, poverty is shown where it is supposed to be out of view.

A cathedral which should in all its parts be a representative of truth, would in this respect be a valuable corrective, and a standing protest against bad principles.

Irrespective of these views I may say that both Mr. Emerson and Mr. Brooks highly value the site in an artistic sense, and Messrs. Bodley & Garner alone would desire, for the sake of more space, to build elsewhere.

I will now proceed to describe in detail the respective characteristics of the designs under consideration, and will afterwards give you, as concisely as I can, a general summary, for your guidance in arriving at a decision.

I will take the designs seriatim, and describe them under the names of their respective authors.

Mr. Emerson.

As regards the treatment of the site, Mr. Emerson shows three designs, respectively marked A No. 1, B No. 2, and C No. 3.

The first shows the cathedral buildings according to the small scale plan, laid down on the site as it exists, without alteration of road boundaries or change of levels.

The plan B No. 2, which I take to be legitimate as a suggestion, shows a somewhat ambitious scheme for combining with the erection of the cathedral a much-needed municipal improvement, in the formation of a high-level road from Dale Street, past the cathedral, and the important buildings to the northward of the site, and leading onwards to St. George's Hall and the London and North-Western Railway Station.

In this plan the cathedral is shown as elongated by one bay of the nave, placing it that much nearer to St. George's Hall, and at the western end by projecting a large flight of steps into the Old Haymarket, occupying the space at present but little used, at the side of the main roadway of traffic. By this plan the level of William Brown Street would be lifted, and fine space given in front of the public buildings, but the descent to the main arteries of communication on the lower level would have to be diverted, as to the possibilities of which I am unable to judge.

The plan C No. 3 shows a new roadway cut through the triangular space to the westward of the site, and the boundary outlines of proposed new buildings to occupy the space at present covered by others of inferior character; but this plan proposes no alteration of existing levels, and would not meet the requirements of the case in a satisfactory manner. The central axis of the cathedral is shown in this case slightly changed to suit the line of the suggested new street.

In each of these plans the accesses to the cathedral have been carefully studied, and whether for the high level or the present lines of roadway are quite practicable.

As regards the cathedral structure, the great fall of the site from east to west almost necessarily entails a considerable depth of foundation walling. Mr. Emerson takes advantage of this for the construction of a crypt under the whole area of the church, utilising a portion of it for cathedral offices, consistory court, and choir-boys' vestry or school, and other parts for necessary provisions in respect of heating, stores, &c. At the western end also, where the depth is greatest, he shows a lower crypt, in which might be deposited the remains removed from the existing burial-ground. As he proposes that all such remains shall be sealed down under solid masonry, the windows shown on the plan would neither be needed nor desirable, and there would practically be only one crypt, the floor of which

Mr. Emerson.

would be a little above the lowest ground level. The value of such a crypt would be considerable, and Mr. Emerson's treatment of it is good. It must be noted, however, that, excepting the western portion under the naves and aisles, the greater part would be dependent on artificial light.

The floor plan of the church, structurally considered, is finely designed, the larger supports of the dome are so disposed as to present the least possible obstruction in respect of sight and sound to a considerable congregation of worshippers, and Mr. Emerson is very confident as to the acoustic value of a church thus planned.

As regards cathedral services, the weak point of the plan is the smallness of the choir.

Mr. Emerson shows two arrangements for the fittings, o founded on foreign, the other on ordinary English usage, which is more likely to be acceptable. But in neither is the space sufficient for the accommodation of the clergy and such choral services as are now ordinarily expected in the cathedral church of an important city. This want of space could be met by the advancement of the choir enclosure under the dome, as has been more than once suggested for St. Paul's in London, and to which, properly treated, I see no objection.

The stalls and benches shown upon the plan will accommodate eighty men and boys, including clergy.

Mr. Brooks provides for 118, and Messrs. Bodley & Garner 106 adults.

In other respects the arrangements appear to provide for every needful requirement.

The accesses are good and sufficient, and the several approaches are well designed.

The cloistral avenues from St. John's Lane on the south side might be made valuable for memorial purposes, in addition to that of dry and comfortable approach, and in fine weather the western open porch would be a feature of considerable value, both as regards beauty and convenience.

The accommodation afforded in respect of vestries, and their usual adjuncts, is sufficient and convenient.

The unimpeded area of the floor of the nave, transepts, and under the dome would be about sufficient for a congregation of 3,550 adults; but other space is also available in galleries for occasional services.

As regards architectural features, what I have said later on on the subject of preliminary studies should be borne in mind in criticising the design, both as regards the exterior and interior. While there is much in Mr. Emerson's treatment of details that is elegant and beautiful, there are also some things which one would fain see altered or altogether omitted; but of course much latitude must be allowed for differences of opinion in matters of taste.

As regards the exterior, taking the respective portions seriatim, I would observe on the western façade that the general idea of breadth attained by placing the western towers outside the general lines is unquestionably good; and the idea of the open porch, adapted from Peterborough, is also good, but fails in effect, by reason of the want of mass and flatness of the arches, as compared with the richer mouldings of its prototype. The simple dignity of the general front is marred by the unnecessary projection of the staircase turret on the western face of the south-western tower, which also overrides the boundary; and it is, I think, by no means certain that the steps shown in the larger perspective drawing, and which under the present circumstances of the site could not be had, would not be better omitted.

There are, nevertheless, in this composition the elements of a fine design, especially if the details of it were modelled rather on the best English than on foreign examples.

Taking next the north and south flanks, the centre portions suffer from want of boldness in the treatment of the roofs; the semicircular vaultings at what may be called the four corners of the great central feature seem almost to demand domical coverings, but are treated with flats, and the transept roofs might be higher with advantage. The porches also would seem to demand more protection where practicable.

The eastern end of the building is less satisfactory than any other, by reason chiefly of the management of the roofs, which seem to have but little relation to the curves of the apses, which add so much beauty to the plane.

All these points are, I think, capable of improvement.

As regards the great central feature of the dome, the outline is good, but the small gablets shown would mar the beauty of its form, and as there is no real need for them, might be altogether omitted, or changed for something of less projection. The great buttresses round the drum are constructive necessities; but there is no reason why their termination should be ungraceful, and they are capable of being made things of beauty The same might be said of most of the solid terminations of buttresses and pinnacles, which further study would doubtless considerably improve.

Mr. Emerson proposes to cover the dome with ribbed terra-cotta tiles of stone colour, as to the pleasing effects of which I

Mr. Emerson.

have grave doubts. The great dome at Florence is covered, I believe, with dark-coloured tiles, but what would be the effect of stone colour, tempered by weather, smoke, and dirt, is more than I can venture to predict.

As regards the interior, I think the general lines are good, but there is much in the detail that requires further study; and I cannot but think that ancient English forms and practices are more suitable for an English cathedral than those which give the detail in which Mr. Emerson so largely indulges. I do not think the beauty of his design is increased, but very much to the contrary, by clothing the pillars of the choir with elaborate sculptures, which confuse the outlines, and detract from the simple dignity of the pillars; it is a practice almost unknown in England, and so far as noble work is concerned, in my judgment more honoured in the breach than in the observance. The main structural lines of a church should be clear and unbroken, except by such minor banding lines as would not disturb the general harmony. Any amount of sculptured enrichment is admissible and interesting in subsidiary features, details of furniture, &c., but all main lines of structure should be clearly and strongly marked. Similar remarks would apply to some of the ornamental features over the intersecting arches in the dome, which do not improve the general effect. Notwithstanding these remarks on ornamentation, as I think out of place, there is remarkable beauty of design exhibited in several details, to which such objections do not in any sense apply.

Mr. Emerson is very confident as to the acoustic qualities of the building he has designed, and in his report very fully describes his views. On a subject on which so little has really been conclusively decided I cannot presume to be positive, but can see no reason why, with proper appliances and management, it should not be possible for a preacher to make himself audible to most of those who could be assembled within the area available for such purposes.

As regards construction, Mr. Emerson says:—

The walls would be faced with stone externally and internally, and hearted with cement concrete. A fine hard sandstone, with a good proportion of silica in its composition, would stand the atmosphere of Liverpool best.

As regards covering, Mr. Emerson proposes fireproof roofs; and indeed he says that—

No timber is used from foundation to finial. The outer covering would be formed of a plain concrete barrel vault, strengthened with brick arches over each pier. These barrel vaults might be covered externally with either lead or copper, or thin terra-cotta tiles, fitting into grooves formed in the upper face of the vaults.

This, he says, is a simple—

adaptation of the Roman method of forming stone roofs.

To these proposals, properly carried into execution, I see no objection.

As regards dome and floors, the pendentives and drum, and thick lower parts of the dome, to about one-third of the height, would be constructed of masonry and concrete. Above this it would be of purposely-made bricks of light specific gravity, and of such a form that the dome should be erected without any centering. Those used for the outer surface of the dome would be grooved, so as to fix the light terra-cotta tiles with which I propose to cover the dome. These tiles would be of a good stone-colour, and with a roll moulding on the surface, and might be of two shades to form a simple pattern. The proportion, construction, curves, weight, and thickness of this dome have been carefully arranged and determined, and the accurate calculations of weights, thrusts, and strains have been made in conjunction with one of the most eminent dynamic authorities in England. Access is arranged to all parts of the building, viz., windows, roofs, galleries, domes, and spires, for surveying purposes and repairs, &c. The floors of the church generally would be of stone, and with marble pattern under the dome; but wood blocks might be used for the flooring if desired.

As regards probable cost, I have had Mr. Emerson's figures carefully tested, and am of opinion that the buildings designed by him could be erected and completed within the required limits of expenditure.

(*To be continued.*)

THE LEEDS FINE ART GALLERY.

A MEETING of the Leeds Town Council was held on Friday last week when Mr. Harding moved the adoption of the report of the committee appointed to deal with matters relating to the provision of a fine art gallery and museum for the borough. The document set forth in detail what had been done with respect to the selection of plans. The result of the competition was that the first premium of 50*l.* was awarded to Mr. W. H. Thorp, and the second of 25*l.* to Messrs. Fraser & Sugden. The report proceeded:—"The committee will now proceed to confer with Mr. Thorp in detail upon his plans, with a view to perfecting all the arrangements, and introducing such minor changes as may appear desirable. It is thought that in the basement, in addition to the space necessary for receiving and packing pictures, rooms may be provided, at small additional cost, which may be very useful to the Electric Lighting or the Lamp Committees. It is not anticipated that any changes will be introduced into the selected design which will increase the cost by more than a few hundred pounds. As soon as Mr. Thorp's plans have been finally revised the committee propose to advertise for tenders, and to proceed with the erection of the building. The premium of 50*l.* will be merged in the architect's commission." Mr. Harding reminded the Council that it decided to set apart 800*l.* a year from the penny library rate, and said that the building proposed to be erected would absorb for interest on capital and sinking fund about half that amount, and that the remainder would be available for maintenance. He trusted the committee would have credit for trying to keep within the expenditure which the Corporation determined upon for the building, viz., 8,000*l.* As chairman of the committee he felt much indebted to two of his colleagues, Messrs. Ambler and Tweedale, for the professional experience they had placed at the service of the committee in connection with the project. When a few alterations had been made in the plans, and the project had been carried out in accordance therewith, he believed they would have a building well suited for the purposes, and one which would call forth the public spirit of the town and generous gifts to the Institution which would be appropriate to the jubilee year of Her Majesty's reign they were about to celebrate.

Alderman Spark thought the committee was entitled to praise, because it had encountered some very severe criticism. They were told by professional gentlemen that it was impossible to do the work for 8,000*l.*, but the result showed that professional men were not always the best guides in such a matter. The President of the Leeds and Yorkshire Architectural Society declared the sum "absurdly ridiculous," and complaint was made of the "curt disregard of skilled testimony," although there were two architects on the committee. It was added that the scheme would "land the committee in a position from which they could only withdraw with ridicule to themselves and injustice to others." Those remarks must be regretted now that the result was seen, especially as some members of the Society sent in plans within the limit of expense.

Alderman Emsley ventured to prophesy that the whole expense would be 12,000*l.*, as the 8,000*l.* did not include architect's commission and furnishing.

Alderman Baker said that if the Free Library Department paid its way it would not have a brass farthing left. Although this was so, it was stated that 800*l.* per year was to be taken out of the penny library rate. They were beginning a work the end of which they could not foresee.

Mr. Harding replied, and assured the Council that there was not the slightest danger of their drifting into large expenditure. The furniture would not involve a great outlay. The chief item would be in connection with cases for objects of art. That would no doubt develop gradually, and the committee would have to spend according to the amount of money placed at their disposal annually.

The report was then adopted with only one dissentient.

TESSERÆ.

The Treatment of Caryatides.

H. B. GARLING.

IT is obvious that, in a great measure, the same rules will regulate the treatment of caryatides which govern the application of sculpture generally to architecture, viz., a general sobriety of treatment; the avoiding all strained and unnatural positions of the limbs; no flutter or discomposure of the drapery; the figure balancing itself most accurately, and appearing in every position in the most perfect equilibrium; the outline of the limbs being clearly developed through the folds of the drapery; and lastly, the absence of the idea of forced and laborious exertion on the one hand, and of positive inaction on the other, that the figure appear easily and naturally to support its superincumbent members, and that they be so treated that the same outline and position do not recur too often. If engaged with the wall, as is frequently the case, a greater freedom of treatment may undoubtedly be adopted, since the outline of the figure will not vary much in different points from which it can be seen.

Italian Gothic Wall Decoration.

J. B. WARING.

The general characteristics of Italian Gothic, or Giottesque style of mural decoration are—a dado, or base, panelled with imitations of various marbles, contained within borders painted in imitation of the glass mosaic work usually known as Opus

Grecanicum, having at times central designs of intricate geometrical and leaf ornament. About six feet from the floor is a cornice with small brackets or consoles, all radiating in perspective to a central point of sight; above this the wall is divided into large compartments, containing historical or religious figure-subjects, the figures being strongly outlined, and the colours flat and distinct, with but a slight use of chiaro-oscuro; these compartments are also enclosed in painted mosaic borders, and beneath each there is a description of the subject illustrated, written in peculiar Gothic letters of a very good style. The vaulting of the roof springs immediately from above these pictures, the only actual projection being one large central rib, ornamented with winding foliage and mosaic borders, and painted mouldings to carry it more agreeably on to the flat surface of the vaulted compartments, which are almost always painted of a deep blue, studded with gold stars, and in the centre of each of which are painted figures, usually holding written scrolls descriptive of their meaning. Sometimes the names are written on the clouds beneath, from which they frequently appear to rise. The intersection of the rib is marked by a gold boss, carved and gilt, but not of great size, having a ring in the centre, from which a lamp was suspended. The ornament is generally a mixture of mosaic-work, Roman reminiscences, especially in the painted mouldings, and transcripts from nature: the two first, however, being predominant. The colours are well arranged, and the ornamental accessories—such as dresses, buildings, thrones, armours, &c.—are of great variety and beauty, and very carefully executed. Such are the general characteristics of most of the mural decoration in vogue up to the close of the fifteenth century, as seen in the works of Orgagna at Pisa and Volterra; of the Lorenzetti and Bartoli at Siena, and in the several Italian schools of Italy. And although the works of Paolo Uccello, Masaccio, Ghirlandaio, and Signorelli present many points of divergence, the principal feature being the greater importance attached to the historical subjects and a very superior style of execution, yet it is not until the time of Perugino that we find a completely different system adopted; and to him appears to be certainly due the introduction of a style in every way superior, which was extended and improved by his contemporaries and pupils, amongst whom Pinturicchio and Raphael are most prominent.

James Wyatt, R.A.

JAMES ELMES.

The first symptom of a regular-bred, genuine architect in the reign of George III. was James Wyatt. Being the son of an eminent and opulent builder in the city of London, who was much concerned in Government and other large building contracts, he received the elements of a sound scientific education necessary either for the builder or the architect. After being thus far qualified in his father's establishment, he refined and purified his taste by investigating the finest ancient and modern structures, and in visiting the best schools of architecture in France and Italy. Foreign travel in those days was absolutely necessary for one who aspired to the eminent profession of an architect; for, with the exception of Sir William Chambers's little Goshen in Scotland Yard, there was no school or master of the art, properly so called, in England. Wyatt surprised the admirers of architecture by his designs and drawings that he brought from Italy, and the extensive knowledge he possessed of the arts in general. His polished manners and numerous polite accomplishments gave facility to the development of his ideas, and secured him a host of patrons and friends among the great. He became the principal architect of the day; was consulted by all the leading peers and commoners of the two kingdoms who were about to build, enlarge, or improve their mansions; corporations sent to him for designs for town-halls and assembly-rooms, bishops for new palaces, deans and chapters for repairs of their cathedrals, and players for designs for theatres. In fact, Sir Christopher Wren had scarcely more employers or more buildings in hand at one time than had James Wyatt in the zenith of his employment. At the death of Sir William Chambers, Wyatt succeeded to his chair in the office of Surveyor-General of the Board of Works, and was admitted to that easy familiarity and confidential intercourse with his royal master, George III., surpassing even that of his predecessor, whom the King always regarded with somewhat of the respect due to a tutor. Indeed, the intercourse which is necessary between a sovereign and his chief architect was as complete between George III. and James Wyatt as was possible between two such persons—the King never desiring to be treated by any one whom he condescended to consult otherwise than as an English gentleman, and Wyatt was too well bred to be either servile or pert: indeed, the familiarity that existed between Charles II. and Sir Christopher Wren much resembled it, except that in this case the King was occasionally too much of a roisterer, and loved to indulge in a few jokes upon his little architect's want of sesquipedalian stature; that between George IV. and John Nash was as professionally perfect, except that here the King was too well bred to notice, in his walks with his little architect in the crowded saloons of Carlton House, the difference of their stature. The before-mentioned qualifications possessed by James Wyatt, till then unknown in one man since the days of Jones and Wren, had, previously to the accession of George III., led to the employment of Italian architects, but now reverted through the influence of that sovereign into English channels. Possessed of genius, taste, and feeling, Wyatt revived a correct style, and introduced one still purer than any of his predecessors, remote, it is true, from all the transcendent purity of the genuine Greek school, but nearer approaching to it than the best Italian known. The ancient architecture of England, the neglected and almost forgotten Gothic, came, by desire of his sovereign, under Wyatt's investigation. Here was a new field opened to him; but he had seen many of the finest Gothic cathedrals of France and Northern Italy in his travels, and the style was therefore not so new to him as to Wren. Nor did he so thoroughly despise it as Wren: yet he never comprehended it in all its exquisite niceties. The restoration of Windsor Castle and the repairs necessary to be done to the venerable cathedral of its diocese, Salisbury, led both the monarch and his architect to close Vitruvius, Palladio, Serlio, and all books treating on the "five orders of architecture," for a time, and to open Dugdale and other musty writers on the cathedrals and castellated buildings of England. The additions to Windsor Castle show that Wyatt thought that if he could not amend he would not alter the original styles of the buildings, and he completed these labours with great credit to himself and to the entire satisfaction of his royal and munificent patron.

Royal Patronage of Art in France.

PROFESSOR DONALDSON.

How fortunate has France been for three centuries in having princes who felt that the fine arts can contribute essentially to the refinement, the happiness, and prosperity of a nation! This spirit has endowed Fontainebleau, Paris, and Versailles with the masterly productions of the greatest minds in Italy and France. The lower orders have their enjoyments in common with the princes, the nobles, and gentry of the land; and they grow up imbued with the love of that art, which is so mixed up with their holiday enjoyments, that it becomes a necessity, as it were, from their being used to it from their earliest years; and they are thus unconsciously educated by the contemplation of the finest works. How far are we in this respect behind our neighbours! The gardens of the Tuileries have no parallel with our royal residence of Buckingham Palace; and Fontainebleau puts to shame the courts and terraces, gardens and walks of Windsor Castle, which contain hardly a single statue, group or fountain, or other art accessories of any consequence, and appear cold and meagre and poverty stricken from the want of such accompaniments. So niggardly and deficient in art feeling have those authorities been who have hitherto had to provide for the palaces of our sovereigns and the places of public resort for the people. Often was Francis I. thwarted by his ministers in his munificent desire to promote the fine arts, but he was not to be turned away from an object which he knew would gratify his people and ennoble his country. And well has this noble spirit been rewarded for his early enlightened cultivation of the fine arts, for his example has been followed by the continued munificence of succeeding monarchs and ministers, which has produced that superiority in the art productions of their manufactures which enables them to compete so successfully with the mere mechanical skill and industry of other nations.

Jacopo Sansovino.

F. LUSH.

He was born in Florence, about 1479; died, aged ninety-one, 1570. His first studies were from the well-known cartoon by Michel Angelo (the *War of Pisa*), which was ordered to be drawn for a painting in the Council Hall at Florence, and which Michel Angelo gained in competition over Leonardo da Vinci. It was a great object of study among the students of the day, and Sansovino upon this masterly production laid much of his foundation of drawing the figure and knowledge of design. From Florence he repaired to the Eternal City, where he studied the *Apollo Belvedere*, &c. Bramante, then the Pope's architect, seeing Sansovino modelling in the Vatican, and pleased with a small vase which he held in his hand, that served him as an inkstand, and which he had designed, ordered him to model in wax from the celebrated statue of the *Laocoon*, giving the same example to three other young artists likewise to copy. Raphael was to decide as to which was the best among the four, and his approbation fell upon Sansovino. This model was cast in metal, and was considered to be a most perfect specimen. At this period Sansovino derived advantages from his inhabiting the same house with San Gallo, being in consequence induced to go through a course of architectural studies. Subsequently, he was with Pietro Perugino, and enjoyed the company of the first *literati* and architects of the day, among whom was Cesare Cesariano (the commentator

of Vitruvius), and Andrea del Sarto. The praises he now received, and the fame he acquired as a sculptor, though little more than the age of thirty, served as a stimulus to exert his talents, and produce works from which he might command higher and yet higher commendation. Temanza says (note p. 13), it is not easy to fix the true period in which Sansovino came to Venice. Vasari places it in 1527, after the sacking of Rome. In Venice he met with congenial spirits, and the friendship of Aretino and Titian; upon which Temanza truly remarks:—"E tutti e tre formarono un Triumvirato in cui trovavono le belle Arti come la lor residenza" (p. 15). In 1529, Buono, the architect of the Procuratie, dying, Sansovino was posted in his stead, with a provision from the State, and a house near the Orologia, on the Piazza. He was considered to have shown some skill in the mode in which he repaired, by means of circles of iron toothed and wedged, the cupola of St. Mark, which had been dilapidated for many years. Some of the work was assigned to him in the School della Misericordia, and in the church of St. Francesco della Vigna, though the elevation is Palladio's; and very beautiful are his bronze *bassi-rilievi* to the doorway in the chapel royal of St. Mark, which are given by Cicognara in the second volume of his "Storia sulla Scultura." He built anew the Zecca, in 1535, which is constructed entirely of stone from Istria. The admired loggia, at the foot of the Campanile, was erected about 1540, the pedestals, architraves, and cornices of which are of the beautiful *rosso* of Verona, the columns of the best Brescia and Grecian marbles, and the remainder of Carrara marble. It is richly adorned with statues, in niches, of *Pallas*, *Apollo*, *Mercury* and *Peace*, and *bassi-rilievi*, emblematic of the States of the Republic. The greater part of this most elegant building is by Sansovino; the rest by his pupils,

Copyright of Designs in France.

J. BOWRING.

The penal code recognises the right of every inventor to the protection of his patterns or other inventions, even though he should not be protected by patent, and provides that a penalty of not less than 100 frs., and not more than 2,000 frs., shall be levied on any individual who violates the copyright of another; and it also provides that a fine of not less than 25 frs. or more than 500 frs. shall be levied on any individual who sells a pirated article. I recollect no French term for "copyright" but the general term *propriété*, or property. The invasion of that property by the piracy of a patent mark or pattern is called a *contrefaçon*, or forgery, and the invader is denominated a *contrefaiseur*, or forger. The law also provides for the confiscation of all pirated copyright, whether of patents or otherwise; also all plates, moulds, and matrices which have been pirated. Formerly the application of this law was left to the ordinary tribunals; but it was found that that machinery was too cumbrous and expensive, as it is the fact at this moment in England, and a local tribunal now exists in most of the manufacturing towns of France, to which all questions of copyright are referred. That tribunal is called the Conseil de Prud'hommes; it is composed of an equal number of manufacturers and workmen, *plus* one manufacturer, who is the president of the tribunal, and this tribunal is charged with the decision of every question of manufacturing interest.

Scottish Mortar.

JOHN GIBB.

Sower (spread) together a quantity of lime and clean sharp sand for two or three weeks before being used; work this well and turn it aside, and as the proportion of the lime to the sand will always depend on the quality of the former, all that is necessary is to take care (in sowering), if the lime is of a rich quality, to put one-third less lime into the heap than it is intended to be built with; and, if the lime is of poor quality, say only one-fourth less. (It may here be observed that in general lime of the poorer quality is best for cementing building) When the lime which has been previously sowered, as before directed, is to be used in the building, or otherwise, it is to be again worked carefully over, and one-fourth of quicklime added in proportions, taking care never to have more in preparation than can be used in a short time; and this quicklime should be most completely beaten and incorporated with the sowered lime, and it will be found to have the effect of causing the old lime to set and bind in the most complete manner. It will become perfectly solid without the least evaporation to occasion cracks, which can only ensue in consequence of evaporation; and this can only happen from the want of proper union between the two bodies. But by mixing and beating the quicklime with the sowered mortar, immediately before it is applied to use, the component parts are brought so near to each other that it is impossible either crack or flaw can take place. In short, beating has the effect of closing the interstices of the sand, and a small quantity of lime paste is effectual in fitting and holding the grains together, so as to form a plastic mass by uniting the grains of sand which otherwise would not fit each other. This system will apply to lime-mortar for all descriptions of work, whether for building, plastering in the inside or outside of houses, water-cisterns, ground vaults, rough casting, &c., &c. It may not be improper to mention that whenever there is any difficulty in procuring proper sand for building, clay is an excellent substitute; and all that is necessary is to make it into balls and burn it, and then pound it like brickdust or pozzolano earth.

Superposition in Gothic.

SIR G. G. SCOTT.

It was the custom of the period (twelfth century) for persons of rank to have their living-rooms well raised above the ground. We accordingly find almost every important room in dignified residences of these early periods placed on an upper floor, and vaulted substructures placed beneath them, which were used for stores, cellars, and for other less important purposes. Even private chapels were often similarly raised for the convenience of being on a level with the living-rooms. It is so with the Abbot's Chapel in Chester, and this is the reason why St. Stephen's Chapel at Westminster and the Sainte Chapelle at Paris (both the private chapels of the palaces) were erected over crypts. We see the same in the Prior's Chapel at Ely, in the chapel at Ely Place, London, in the chapel of the Tower of London, and in many other instances.

Gothic Orbs or Blind Windows.

R. WILLIS.

It is well known that in the later periods of Gothic architecture the use of stone panelled tracery increased gradually to so great an extent that in the more elaborate buildings the walls and vaults, and every space unoccupied by actual windows, were covered by them. I shall proceed to show that these panels were termed "orbs." This I shall do by comparing three independent passages in which the word occurs, with the existing buildings to which they refer. The indenture for the tomb of King Richard II. and his Queen in Westminster Abbey covenants that there shall be niches for statues on each side having *orbs* between them to match. "Et les ditz masons ferront measons (maisons) pur xii images, c'est assavoir vi a lune coste et vi a lautre coste du dite toumbe, et le remenaunt du dite toumbe sera fait ove (avec) *orbes* accordauntz et semblables as dites measons." Accordingly the tomb has tabernables (*maisons*) at the sides, between which are placed blank panels (*orbs*) corresponding to them, as may be seen from the drawing of the tomb of Edward III., which is exactly similar, in Blore's "Monumental Remains." William of Worcestre describes the tower of St. Stephen's at Bristol in the following words:—

> Habet 4 storyes et ibi in quarta stori sunt campanæ.
> In superiori historia tres *orbæ* in qualibet panella.
> In secunda et tercia historia sunt duæ *orbæ* in qualibet panella 4 panellarum.
> In inferiori *historia* sunt in duabus panellis in qualibet panella [south and west] fenestræ, in aliis duabus panellis ex parte boreali et *orientali* sunt duæ archæ.

If orba be translated "a blank window," the above becomes a correct description of the existing tower. For its decoration consists not so much in stone panelling as in literal blank windows, which are formed in each storey. The lower windows are open as usual, but in the upper storey where the bells are the blank tracery is not pierced, but a window-opening is formed between part of the mullions only of the central blank windows of each side. The description, if translated thus, will agree perfectly with the tower as it stands:—

> The tower has four storeys, and the bells are in the fourth or upper storey.
> In the upper storey there are three *blank windows* on each side.
> In the second and third storeys are two *blank windows* on each side of the tour.
> In the lower storey there are *windows* on the south and west sides; but on the north and east there are *arches* (for on these sides the tower joins the church).

There exists an indenture for the furnishing of one tower at some one of the corners of King's College Chapel (probably as an experiment), for in the same document it is covenanted that all the fynyalls (pinnacles) of the same chapel shall be made according to one that had been set up. It is agreed that the said tower is to have "fynyalls, rysant gabbletts, batlements, *orbys*, and crosse quarters, and every otherthynge belongyng to the same—according to a plat thereof made." This description corresponds very well with the existing tower. I shall merely point out the orb, or blank panel, with its cinquefoil head, observing that this is not opened with tracery for glass as usual, but that the tracery, or string of cross quarters, is so introduced as to be a mere piercing of part of the stone panel, without destroying its character as a blank panel. As in all these examples the word so plainly applies itself to a blank or blind window, I imagine it must be derived from the Norman French *orbe*, "qui est caché, secret, privée de quelque chose, aveugle. *Orbus*, Lat.'

NOTES AND COMMENTS.

THE rearrangement of the pictures in the Louvre has given rise to unexpected discontent among the visitors who were most familiar with the galleries. The works might not have been hung in the places that were best adapted to illustrate the history of art, but everybody knew where to find them. Now an old visitor is put on the same footing as a stranger, and has to begin anew a topographical education before he is able to discover the whereabouts of things with which he used to be acquainted. The catalogues are not yet adapted to the new dispositions of pictures, and, moreover, was a Frenchman, or at least a Parisian, ever known to carry one of the massive volumes? The conservators ought to act upon the principle that is in use in the Salon, and put a sheet of paper with the names of the pictures at the entrance to each of the galleries which are altered in any way. The new works, which many visitors care alone to see, might be indicated in red. Better still would be a lithographed plan of the galleries on which the positions of the pictures could be marked.

FRANKFORT is about to erect a statue of ARTHUR SCHOPENHAUER. The philosopher was not a native of that city, for he was born in Dantzig in 1788, but from 1831 he lived in Frankfort, and it was there he produced his most noted works. The city naturally desires to have its representative philosopher set up in bronze. His system may not have superseded those of his rivals, but of late years it is more talked about, and that redounds to the credit of Frankfort. The sculptor for the work has to be selected, and it is no easy task. Was not SCHOPENHAUER once called "the dog-faced metaphysician"? He was the advocate of the universality of will, and his countenance suggested that he was endowed with no small measure of that faculty. But if a statue could be made of BEETHOVEN, something can be done with the systematiser of pessimism.

MR. EDGAR FARMAN, as honorary secretary, writes to say that the Architectural Federation Committee has considered the subject of a meeting of Assistants, and is in favour of such a meeting being held, and, further, the committee is ready to provide a suitable place of meeting in London, provided the Architectural Assistants will organise a committee with a view to discussing the subject of Architectural Federation amongst themselves. The Federation Committee will be ready to receive any deputation from such a meeting, and any resolution passed and forwarded to them through the chairman of the meeting will be carefully considered.

THE Ecole des Beaux-Arts has not gained much renown this year. In the examination which has just come to an end, no work by the architectural students was considered to be worth the medal for free-hand drawing. For the modelling of ornament and designing ornament, only third-class medals were awarded.

THE alterations of the customs tariff of the United States are becoming so subtle, that they almost match the problems of the old scholastic dialectics in their ingenuity. For example, there is a clause which decrees that "manufactures of wood, or of which wood is the chief component," are to be charged an *ad valorem* duty of 35 per cent. But when an article is made up of sawdust and glue that is fashioned in a mould, is the compound to be called "wood"? The United States Government have gravely deliberated on the subject, and have decided in the affirmative. It makes no difference if there is a preponderance of glue in the article. Are magic lanterns philosophical instruments? If they are used as aids to a lecture on a philosophical subject they might be so considered, but the stern Conscript Fathers regard them as toys, and henceforth they are to be mulcted in a duty of 45 per cent. That is higher than the usual rate, for the paper ornaments used for Christmas trees during the season pay no more than 35 per cent. Cement is sent over to the States sometimes in sheet-iron drums with wooden ends, which are worthless for other purposes. It was proposed to tax the casing as well as the cement, but, on consideration, the drums were considered to be "coverings," and therefore exempt. A citizen who has a few books sent over to him from Europe has to pay duty on them "without regard to value," which, we suppose, means that the cheapest will be treated as an *edition de luxe*, unless they are "printed and manufactured" more than twenty years before exportation. Manufactured is evidently the official term for composition, and in the official mind printing goes before inspiration.

THE French Minister of War has subscribed for copies of the excellent memoir of HENRI REGNAULT, by M. MARX, forming one of the series of "Artistes Célèbres," and it is to be included among the books recommended for the military libraries. M. MARX has recently visited Spain in order to report to the French Government upon the schools of art in that country.

IF the German statesmen have not an eye on Spain the German merchants have, and apparently they are resolved to captivate the country. It now appears that they are sending handsome volumes in the Spanish language broadcast through the country. We are officially informed that the books contain music, engravings and other attractive features, but they are in reality a mere aid to advertise German goods. The Spaniards must have grown very simple if they are caught so easily. In England, expense of the kind is thrown away, for it only serves the dealers in waste paper, and it is likely that if in Spain the engravings and music are preserved, the advertisements are converted into cigar lights.

THE French authorities, having taken over the buildings of Mont Saint-Michel, will shortly be called upon to pay what is considered a large sum to preserve a part from destruction. An allowance of 2,400*l.* a year was lately assigned for works of restoration, but that sum is insufficient to uphold the central tower, which is sinking with a portentous regularity. M. CORROYER, the architect, by the desire of M. GOBLET, prepared an estimate of the probable cost of the work, and the figures reach 12,000,000 frs.—an amount that is enough to drive the Chamber into a state of consternation. The Ministerial changes have deprived M. GOBLET of the opportunity of bringing in a Bill to authorise the expenditure of so much money, although from his present position, as head of the Cabinet, he will be able to help his successor when he makes the attempt. There is a fatality about the works at Mont Saint-Michel which may deter the deputies from approving of the outlay. A contractor for the works of defence lately brought an action against the authorities, and gained it, as the courts held that the plans were not prepared according to the rules of constructive science.

THAT an artist should be wary of interfering with politics in France is suggested by the fate of M. BAFFIER, who is now in prison for his attempt to kill one of the Paris deputies. A sculptor's life is hazardous, and it is possible that M. BAFFIER suffered much, for his *atelier* was filled with models for which no commissions could be obtained. But he was not in a state of indigence. He was too practical an artist to fail of work of some kind. M. BAFFIER worked before now as a monumental mason, and he was employed on the restoration of Angers Cathedral. At the time of his arrest he was director of the erection of the Gambetta Memorial. He had gained a Salon medal, and the figure he exhibited last year (*Marat*) was purchased by the Municipality, although it was not a work of genius. With patience he might expect further success. M. BAFFIER, like so many artists, imagined that he had a mission, which was to emancipate sculpture from classic trammels, which not only are supposed to bind but to freeze the soul of an artist. He, in consequence, over-estimated the value of his own works, and was bitter against a world which declined to accept them as the latest gospel of art. Then he took to attending political meetings, and discovered that his representative's speeches were as false as the statuary of Greece and Rome. M. GERMAIN CASSE was therefore selected as a victim, but the intervention of some other deputies saved his life.

THE ROYAL ACADEMY.

ON Friday last, Sir Frederick Leighton presented the prizes to the students who had been successful in the competitions held in the schools. There was a large assemblage of students and their friends, and the following Academicians were present :—Sir J. Millais, Messrs. Alma Tadema, Marks, Ouless, Poynter, Leslie, Armstead, Armitage, Frith, Waterhouse, Norman Shaw, Yeames, Burne Jones, Marcus Stone, Fildes, Leader, Seymour Lucas, Briton Riviere, Hook, and Calder Marshall. Sir Thomas Jones, president of the Royal Hibernian Academy, and Professor Marshall Wells were also present.

The President delivered a short address to the students, remarking that he could never take part in any distribution of awards without some little disturbing consciousness of the want of proportion in the operation. He saw coming up to the table the successful candidates, relatively few in number—coming up one by one to receive their well-merited honours amid the clamorous and generous applause of their fellow-students. The victors were raised above their fellow-students, and between victory and defeat there was an enormous difference. There was a gulf fixed between a prize and no prize, but yet he could not silence the recollection of how narrow was the margin that often divided those who had failed from those who had won. But that anomaly was inherent in all competitions and therefore inevitable. Proceeding to deal with the merits of the various competitions, Sir Frederick pointed out that in four of them they had not felt justified in giving more than one prize, and in two out of those four the prize was a second prize only. On the other hand, there was one class in which the display of work had been so extremely gratifying as to justify and demand altogether exceptional acknowledgment. He alluded to the Creswick competition for landscape painting. In that competition no less than three "honourable mentions" had been awarded in addition to the one prize which they had to dispose of, and out of the three works so mentioned one ran the victorious work so close that the result hung on one single vote. To that work a *proxime accessit* had been given. Between the two extremes of merit the average of works seemed to them altogether satisfactory, but the great and culminating fact and feature to him of this distribution had not been mentioned. He had often told the students how deep a satisfaction it would be to him if he were able some day before long to make in the class of design for the decoration of a public building the highest award possible, namely, by a commission to execute the design. That had been long deferred, but that night, for the first time, he had the great joy to announce that it would be realised. In the class of drawing of a figure from life an occasional hankering after manual dexterity, indeed almost trickery, had been noted. He wished earnestly to impress upon them that the true mastery was never effected by anything that savoured of a trick. Trick and dignity could never go hand in hand. He wished also to remark with regard to the class of a cartoon of a draped figure that it seemed to him that there was a tendency to forget the object for which the competition was instituted. The object was to encourage students in the study of drapery as an element of design. It was not sufficient that the figure should be draped, but it must be draped in such a way that the drapery increased its beauty and enhanced its dignity. That condition had been held in view by only one competitor, and he was the prize-winner in the class.

The presentation of the prizes was then proceeded with, the following being a list of the chief prize-winners :—Landscape Painting.—Creswick Prize of 30*l.*, Arthur John Foster ; honourably mentioned, Arthur T. Nowell, Burnard Rooke, and Stephen B. Carlile. Painting of a Figure from the Life.—Silver medal—1st, H. Barrett Carpenter ; 2nd, George G. Kilburne. Painting of a Head from the Life.—Silver medal—1st, J. W. Perrin ; 2nd, F. H. A. Parker. Copy of an Oil Painting.—Silver medal—1st, J. D. Penrose ; 2nd, L. A. Pownall. Copy of a Landscape.—Silver medal—W. G. Wilson. Design in Monochrome for a Figure Picture.—Armitage Prizes—1st, 30*l.* and a bronze medal, Sidney Paget ; 2nd, 10*l.*, not awarded. Design for the Decoration of a Portion of a Public Building.—Prize 40*l.*, H. J. Draper. Cartoon of a Draped Figure.—Silver medal and 25*l.*—R. A. Bell. Drawing of a Figure from the Life.—Silver medal—1st, Alfred Andsell ; 2nd, F. S. Beaumont. Set of Six Drawings of a Figure from the Life.—1st, 50*l.*, Albert Starling ; 2nd, 25*l.*, Alfred Andsell ; 3rd, 15*l.*, C. H. Bartlett ; and 4th, 10*l.*, G. H. S. Cowell. Drawing of a Head from the Life.—Silver medal—1st, Helen S. Squire ; 2nd, Florence H. Burgess. Drawing of a Statue or Group.—Silver medal—2nd prize, H. P. Mostyn. A prize of 10*l.* was also given in this class to Alice Maria Dicker. Perspective Drawing in Outline.—Silver medal—Anna Maria Gayton. Model of a Design.—1st, 30*l.*, W. H. T. Venner ; 2nd, 10*l.*, G. J. Frampton. Set of Three Models of a Figure from Life.—1st, 50*l.*, H. A. Pegram ; 2nd, 20*l.*, W. G. John. Model of a Figure from Life.—Silver medal—1st, W. G. John ; 2nd, A. G. Walker. Restoration of a Mutilated Antique Statue.—John Rhind. Model of a Group or Statue.—2nd prize, John Rollins. Design in Architecture.—Travelling studentship, 60*l.*, E. H. Sedding. Set of Architectural Drawings.—Silver medal—G. T. M'Combie. A further prize of 25*l.* in this subject for the upper school was taken by S. B. Russell. Set of Drawings of an Architectural Design.—10*l.*, C. C. Wilson. Perspective Drawing in Outline.—Silver medal—R. S. Ayling.

GERMAN CRITICISM ON ENGLISH PAINTING.

THE last number of the *Deutsche Rundschau* contains an article on the recent exhibition in Berlin, by Herr Herrmann Grimm. In speaking of the English pictures the critic writes :—

At a time when it would almost seem as if the art of producing anything really beautiful no longer existed, we are met by a proof to the contrary in the exhibition of portraits by English painters, which charm us by their spiritual depth and an excellence which is all their own. Much has been said as to the causes of the extraordinary artistic capacity of these masters. Most people appear to have come to the conclusion that it is because artists can allow themselves more time for their work. I would remind my readers of the following. We all know art as well as politics went through its revolution at the end of the past century, and the disastrous effects thereof. Art in England was untouched by that revolution, and, undisturbed, pursued its own course forwards and alone. Editions of Reynolds's writings followed one another in unbroken succession from the end of last century on into the present. Reynolds remained the critic who set the tone, and his pictures also enjoyed without interruption a similar place of honour. The English had no need of either Greece or Italy, for the best art of both countries in every century was to be seen at home. A critic such as Ruskin could hardly exist in Germany. Another Englishman, Mr. J. A. Crowe, has done much to bring the modern historiography of art to its present high level. So it has come about that the English painters of the first rank are carrying on their art in that tradition of the eighteenth century which we possess no longer. When I speak of tradition, I mean the direct connection of the school with the great masters from the Cinque-cento onwards. Tradition does not mean the copying of the special style of this or that master by individual painters according to their personal fancy, but the general carrying out and development of conceptions transmitted from earlier generations. We, too, have our painters after Titian, Rembrandt, and Holbein. In England art has made its own the totality of all that the previous century drew from the study of all the earlier masters, and has gone forward in that path without even imagining that it could do otherwise. Hence the all-round completeness of the English portraits at our exhibition ; the complete satisfyingness of this manner of representing a personality in a picture ; the virility, strength, scholarliness, and at the same time freedom of this art. These pictures are produced by really cultivated men, who know the world, who understand the great masters, who are conversant with the history of art, and who work for a public which, as far as æsthetic culture goes, is on equal terms with them. They may be proud of having produced work of real artistic value—of pictures which have a fixed historic currency, and are not mere experiments which can hardly be bought for money to-day and to-morrow will perhaps hardly find a purchaser. Of masters such as these we have but few in Germany, and what there are of them are not represented at our Jubilee Exhibition by anything worthy of their powers. English art is the outcome of a harmonious and consistent national development. I myself have no partiality for England. The passionate coldness (*sic*) of the English is antipathetic to me. There are occasions on which they at once freeze up—become spiritual icicles. But who would deny the culture that this people possesses? What thirst for truthfulness! What efforts they make to inoculate their children with the feeling for a manly freedom! Nowhere is the individual so developed as in England. Nowhere is a

special endowment so well able to find out for itself the especial place from whence it can effectually work. I feel as though this spirit were speaking to me from the pictures which the English painters have exhibited in Germany.

LIVERPOOL ARCHITECTURAL SOCIETY.

THE fourth ordinary sessional meeting of the Liverpool Architectural Society was held on Monday. Mr. G. E. Grayson, the president, was chairman. Mr. J. M. Hay read a paper entitled "The Liverpool Cathedral.—What! Something more about it." The original design of Messrs. J. and W. Hay for the proposed Liverpool Cathedral was exhibited on the walls, as well as two new designs of the exterior, one of them showing a reversed order of composition, inasmuch as the dome was made to form the principal feature and the western towers a secondary one. Messrs. Hay adhere in their preference for their original design as the best and the right one; for though it may be inferior as an architectural composition, they consider it is so in order to attain a nobler idea.

Mr. Hay said that whether the cathedral should be begun now or never erected at all, it was nevertheless a theme of surpassing interest and a splendid text for a lecture on architectural art. He touched upon the questions of style, site, the proper position of the building on the site, and then dwelt at considerable length on the mixture or combination of styles, as shown in their design. Amongst other things he adduced St. George's Hall, one of the noblest architectural productions of the nineteenth century, as a case in point for them; while, in the interior, with its vaulted ceiling and round arches the style was Roman, there was nothing of that outside but the pure Greek ordonnance. The rise and progress of Gothic art was to be found in the cathedrals of France, England, and Germany. Its course for three centuries was the most glorious in architectural history. But that course was run and could not be run again. They could no more revive the Gothic glories of Christendom than they could the Classic glories of Athens. There was much in both styles that must live, for the good cannot die, but only by recasting it in modern thought, and not by slavishly reproducing the lineaments of a bygone age. He pointed out as a defect in all our cathedrals the obstruction caused by the heavy pillars which support the vaulting at the main intersection, the solitary exception being that at Ely, where Alan de Walsingham tried to remedy the defect, and therein showed that he had some glimmering light of what the dome was destined to achieve in the future service of Christian art. Nothing further was accomplished till Sir Christopher Wren picked up the pencil which had fallen from his fingers of Ely, and at St. Paul's carried the application of the dome another stage forward. Another blemish was that of the roofs being always constructed of perishable materials. They avoid that defect by having their domes covered with an arch of stone or hollow brick, which is at once the ceiling and the roof, and those portions of the building which were to be vaulted would be laid with lapping flags of stone lineable with the pediment, by which means the fabric would be rendered imperishable, the roof and ceiling being of the same material as the walls. Although they have no outer covering to the dome like those sometimes made to raise it for the purpose of rendering it a more important feature in external design, he was not prepared to condemn such coverings. Some strict architectural critics did so, and Pugin in his "True Principles" designated that of St. Paul's as a huge expensively constructed sham. He did not think we should go so far as that; we have a right, however, to insist that it should at least be constructed of materials that would neither rot nor burn. A few weeks ago there came under his notice an interesting work by the Professor of Fine Arts in the University of Edinburgh. There was much in what the author said which confirmed his own views respecting the dome, both as to its general treatment and its use as an architectural form; but, notwithstanding the exalted terms in which he referred to the interior effect of St. Sophia, and affirmed that the problem of the Christian domed church there received its full solution, Mr. Hay considered that he had failed to perceive the full nature of its language as an element of architectural expression in Christian art. The Gothic structures of Christendom all speak with one voice—the voice of aspiration, the longing cry of the human soul after the Infinite. But that was only a part of Christianity. What was wanted was the other—the Gospel part—the response to that cry—the expression of the Divine presence. There was no other architectural form in the world but the dome which spoke to us in that voice. If then there was more gospel in the benediction than in the cry, there was more Christianity in the dome of St. Sophia than in the tower of Strasburg and the choir of Beauvais. But why was it that Christianity spoke through the tower of Strasburg and choir of Beauvais and not through the domes of Florence and Rome and London, but that the style of those buildings could not speak the language of aspiration; and the language of the Divine presence and response which that style could have spoken was left unuttered by them? The architects of those buildings had misapprehended the true meaning of the dome, for both externally and internally, instead of allowing it to speak in its own native tongue they pronounced it with a foreign accent. Had the inner dome of St. Paul's not been made to assume a Gothic form, for which there was no collateral necessity?—for, sprung over at about the level of the whispering gallery, it would have doubled its effect, and its language would have been distinct, intelligible, and impressive. The outer dome and peristyle of St. Paul's was perhaps the finest thing of its kind that was anywhere to be found, but its voice was in falsetto. He feared that the noblest use of the dome in modern times had been missed by Brunelleschi, by Buonarotti, and by Wren, for by setting it upon a drum, and elevating the pitch of its curvature, they had certainly made it an imposing architectural feature, well seen at a distance, but they had robbed it of expression—a nobler quality. They must have both expressions in the building which was intended to be representative of the fulness of Christianity. Referring to Messrs. Hay's original design, he said that here for the first time in architectural history was the attempt made to combine in one building the two grandest expressions of architectural language—human aspiration and the Divine presence; to set up, as it were, the Jacob's ladder which should typify the Union and the Communion of Heaven and Earth. In the vertical lines and pointed arches they perceived the ascending thoughts and the human cry; in the great round dome the Father's presence and outspread hand. The distinguished author already referred to says (as if by way of disparagement) "that the dome tends to its centre, and bars egress." But in that again he misread its character. Its function was not egress, but ingress—not ascent, but descent; not aspiration, but response: and beneath it they were each made the centre of an influence which—manifesting itself at the zenith—streams down in all directions, until overflowing the natural boundaries of its own circumference it reaches beyond the supporting arches to those which terminate every vista and fills the whole house with its presence. His design might be faulty in many respects; but if the Liverpool Cathedral was to be a true exponent of the most advanced thought of the present day it must be conceived somewhat in the manner of those lines, and not a mere travesty of the dead-letter of the past. From the complex nature of the Christian Faith the material edifice could not be truly representative unless by a homogeneous combination of styles. As to purity of design, there was no such thing in the strict sense of the word in modern architecture. It was impossible, unless the architect shut his eyes to much that was noblest and best around him. It was impossible, as long as three principles of construction were in daily use—often all three of them present in the one building at one and the same time. It was also impossible, because any style that was merely pure and simple could not meet all the exigencies and requirements of modern life. The pre-Raphaelite recipe of selecting nothing, rejecting nothing, was of no service to the architect; for the art of design was pre-eminently one of selecting and rejecting, of refining and combining, and by thus obtaining the best of the best insuring the survival of the fittest.

In the course of a discussion which followed Mr. Mercer expressed the opinion that the design which Mr. Hay had so highly praised was of an absurd character, according to the present feeling existing among the bulk of architects. Mr. Crofts said that Mr. Hay's proposal to erect a cathedral at right angles to St. George's Hall was a good one, and should be adopted by the Cathedral Committee. Mr. Goldstraw remarked that there was much to be said in favour of Mr. Hay's arguments, and the paper was in more respects than one remarkable. On the motion of Mr. Mercer, seconded by Mr. Crofts, a hearty vote of thanks was accorded to Mr. Hay for his paper.

EARLY TRIALS OF ACADEMICIANS.

AT the meeting of the Carlisle School of Art, which was held last week, the Rev. Canon Richmond (who is the son of Mr. G. Richmond, R.A., and a brother of Mr. W. B. Richmond) told the students that his father became an artist and earned his living from the time that he was 14 years of age. Like an artist, his father married early, and he was his eldest son, and had seen his father through the early difficulties of his life, when he was at times painting from eight o'clock in the morning till eight o'clock at night, and only lay down on the hearthrug for rest and refreshment between the visits of his sisters. He (the speaker) was quite a little lad at the time, but when he saw how hard his father had to work he said to himself he would never be a painter, and he stuck to that resolve. Although he was made to draw for two hours a day for some time when he was about ten years, he struck entirely

and never drew another line when he went to school at eleven. The days were gone by when Sidney Cooper, the animal painter, and his (the speaker's) father finding themselves on a journey in the middle of Kent, and many a mile from London, collected their money, and found that it only amounted to 1½*d.* That was their case, but he did not believe the time had gone when the artists would have to work very hard from the beginning of their time. They knew the artist Mr. Phil. R. Morris, whose pictures were sent out at Christmas in the social journals. That man he had known in his early times and struggles, when it was a very difficult thing for him to keep body and soul together, and now he was quite successful, and looked up to by the whole profession of artists, and, what was more important, by the profession—or should he call it the trade?—of picture dealers. It was said that art was long and life was short. Art was long, it was perfectly true, and it was very conservative. Education generally must be more or less conservative. Look at our education nowadays. He meant to say the liberal education. A little time ago it was for teaching everybody French and modern languages, and all that; but they found it was very much better to ground their scholars in their Latin and Greek as being the best sort of education that they could have. They must go back to the classics, and he was reminded of the fact that the *Dancing Faun*—for which one of the prizes for drawing was given—was the very same model as that from which his (Canon Richmond's) father drew, and which admitted him as a little boy something like twelve years old into the Royal Academy. So they saw the same grammar studied now which was studied about sixty years ago, and it would have to be continued. At the time when art schools and art education was first interesting Mr. Gladstone, somewhere about 1842 he thought, then there were different people put on the Commission in London, among them being the speaker's father and Mr. Richard Redgrave, and the grand stand was made on what he might call the grammar of classical education to artists. It was not to be mere utilitarian art that the School of Art was to teach, but the students were to learn to draw the figure, because, as he remembered very well being said by Mr. Mulready, the Royal Academician, any man who could draw the figure proper could also draw a tree and pretty well anything else.

GLASGOW ARCHITECTURAL ASSOCIATION.

A PAPER was read by Mr. W. J. Anderson at last week's meeting on "Evolution in Architecture." The subject was treated first as analogous to evolution in nature, though actually comprehended in it, the sphere of human thought and work being regarded as under the control of natural law. An examination was made of the factors in the process, and of the characteristics of periods in styles or cycles of art, as being just those which would attend corresponding periods in any common natural process. The features of the column-shaft and the buttress were instanced as typical examples of accommodation to varying conditions, and an interesting account was given of their origin and development by the working in and around them of causes and effect. The essay was illustrated by drawings and photographs, and at its conclusion, after a discussion opened by Mr. Boston, a vote of thanks was passed to Mr. Anderson.

THE ASSOCIATION MASONRY CLASS.

ABOUT a month ago we gave a short account of the opening meeting of the classes of masonry at the City and Guilds of London Institute. It was said that the instruction was to be given by means of two classes, the one limited to a few pupils who were to be prepared to serve as foremen or assistant teachers to other classes. Since then the members of the first or preliminary class have had three meetings, and feeling themselves sufficiently prepared to take up their duties as foremen, it was decided to start the second classes on last Tuesday.

In Mr. Harvey's opening speech, which was reported at the time, this class was called the subsidiary class; but it is, on the contrary, the principal class of masonry fully organised. It resembles nothing which exists in any of the technical high schools, either in England or abroad, and it is to some extent an adaptation of the educational teaching which was formerly given in the Ancient Guilds of Stonemasons. It might be described as a large builder's yard on a small scale, for it presents a formidable staff of officers, as the class is divided in eight divisions each headed by a foreman. On the other hand, luckily, the number of privates that form each division is but small, otherwise the building of the Guilds Institute, large as it is, would be too limited to contain Mr. Harvey's army of amateur masons. According to sound military principles of organisation nothing is left to chance; but each foreman receives written instructions for the day, clearly defining his duties, the work he has to see carried out under his supervision, the method to use in imparting his instruction, &c. &c. He has to keep an account of the stones worked by each mason in his division, and to see that each stone is signed in large letters on the face with the name of its author. With such a large staff of foremen the class could certainly accommodate more pupils, and architectural students would do well to seize this exceptional opportunity of getting useful knowledge in a practical way. In a class of that kind there can hardly be too many pupils; the work will be got through all the more rapidly by having more hands to do it, and the proceedings will be all the lively and interesting. Senior members of the profession who are interested in technical education ought to visit this class, which presents features which might with advantage be adopted elsewhere. The next meeting will take place on January 11.

SAXON REMAINS IN THE BATH DISTRICT.

AT the last meeting of the Bath Antiquarian Field Club, the Rev. Prebendary Earle read a paper on "The Traces of the Saxon Period in Bath and Neighbourhood." He said it was more than 800 years ago since the Saxon period was brought to a close, or supposed to have been brought to a close, by the Conquest; and then from the time that it closed to the time when it began they must reckon a period of 500 years. A remote period, certainly, and yet it was not long ago to any one who studied national life. Bath was a spot in which one might be naturally led to inquire after Saxon traces, from various historical reasons. It was first of all a Roman city, and then it was captured by the Saxons from the Britons and lay waste for a hundred or two of years, for the Saxons were not fond of city life. At length it was occupied by a religious house founded by King Osric, and this house became the centre around which a new population grew. Of all this they had records; even of the time of desolation they had a written memorial in the form of a meditative poem on a city in ruins, and pools of water of natural heat, which appeared to him to indicate no other place than Bath. The Chronicles mentioned the capture of Bath in 577, and they had a considerable number of documents relating to Bath, documents of various dates during the Saxon period, and these dealt with two things, the transfer of land and the manumission of slaves. In these documents they had mention of Widcombe, Lyncombe, Northstoke, Priston, Farnborough, Corston, Weston, Hampton, and Freshford. An American or New Zealander, or any visitor to their land who had studied their early literature, might naturally ask what visible and tangible objects remained in existence in the neighbourhood. Dealing, in the first place, with what had been here, but which had been removed, he alluded to two books in a Cambridge library relating to the landed property of the monastery of Bath, and then proceeded to speak of Saxon coins. There were, undoubtedly, a great number of coins struck in Bath from the time of Athelstan, and he was of opinion there was a regular coinage there, or more than one coiner, for there were a large number of coins in existence of the Saxon period and with the name of Bath on them; but, he was sorry to add, there was not one to be found in the city itself. Nor were there any traces of the old Saxon abbey. There were traces of the Norman buildings, but of the Saxon they had no portion of the architecture remaining, though he thought he could point to certain fragments which were connected with it. There were in the Institution portions of two Saxon crosses, and in the excavation at the Roman baths a good, bold piece of Saxon carving, apparently the upper part or shaft of the cross, was discovered, and also the basement of a Saxon pillar. At Bitton Mr. Ellacombe said that over the chancel arch, which was Norman, there was a trace of a previous Saxon chancel arch, and at Limpley Stoke there was a very remarkable Saxon doorway in complete preservation on the south side of the church. The Prebendary then spoke of the Saxon church at Bradford, discovered in their own time, and which corresponded exactly to William of Malmesbury's statement that Bishop Aldhelm built at Bradford an ecclesiola. This church contains what he supposed was the finest piece of Saxon sculpture that was known, though in the vestry within the chapter-house of Bristol Cathedral there was a fine Saxon relief, but it must yield the first place to the sculptured angels in the Bradford church. Another feature of the Saxon period to which he referred was the earthen mounds, many of which could still be observed, which were no doubt Saxon, and represented the ground-plan of a Saxon gentleman's house—the house of the owner of the property. He thought the mounds at Englishcombe—distinct from the Wansdyke—might be claimed to belong to these traces of fortified houses—one of the most durable features of the Saxon times. Mention of the yew-tree at Charlcombe Church led the speaker into an interesting discussion of the reason why these

trees were so often to be found in our English churchyards. He did not accept the idea that they took the place of cypresses as a symbol of mourning in consequence of their dark foliage, but considered rather that they were originally planted for the shelter and protection of worshippers at the cross at a time when they had no roof over their heads.

HOUSE RENTS IN GLASGOW.

AT the meeting of the architectural section of the Glasgow Philosophical Society on Monday, Mr. John Honeyman read a paper on "The Incidence of Taxation as affecting the Housing of the Poor." Mr. Honeyman, considering what taxes affected the rents of dwellings, and how the rents were affected, said that the taxes which chiefly contributed to increase rents were municipal, parochial, and school rates, house duty, and property tax, altogether about 5*s.* 3*d.* per 1*l.* of rental. It was a popular delusion that part of these rates was paid by the proprietor; it was paid by the tenant through the proprietor. The amount added to house rents in Glasgow which tenants fondly supposed to be paid by landlords was about 98,000*l.*, and that was over and above the still larger sum paid by themselves directly. The rates for municipal, parochial, and imperial purposes actually added 25 per cent. to the rents. Considering how different classes of tenants were affected by these taxes, and especially how important it was in the interest of the working-classes that houses and every other kind of heritage should be entirely exempted from taxation, he contended that the burden was more oppressive to the poor than to the rich. The poor man's tax was oppressive and the rich man's was not, for the manifest reason that whereas the rich man could pay his tax without depriving himself or his family of one single thing necessary for their health and comfort, the poor man could not without doing so. To the rich man the tax was no burden—it was not oppressive because he threw it off whenever he liked by taking a cheaper house. The poor man could not; however grievous to be borne he must bear it, and it was therefore oppressive to him. He maintained, further, that it was unjust that some of the poor should pay and some should not; and utterly intolerable that while the burden was rigorously laid on the shoulders of the honest and the thrifty, the dissolute and the profligate should be relieved. What could be said for a system which allowed an unencumbered man with 30*s.* or 2*l.* a week, who lived in a model lodging-house, to go Scot free, and exacted more than 4 per cent. of his total income from the man who had a large family to provide for? Why was this iniquity perpetrated? There was but one answer. The decent labourer had a house of his own, the spendthrift mechanic had none. They, therefore, for this, and for no other reason whatever, taxed the one and not the other. The question naturally arose, how could the necessary taxes be raised in any other way? It was impossible for him there to enter upon that subject—his only object was to point out the evils of the present system—but he was tempted to refer to one objection to any change in the incidence of local taxation raised by Mr. Goschen. Mr. Goschen said it was impossible to localise income. Mr. Honeyman submitted that all that was necessary to localise income was to individualise it, and, having individualised it, the location of the individual could easily be determined by the register. Where the individual voted there let him be taxed. A comprehensive and a radical change of the present system, he contended, was required. The inequality and inexpediency of that system was equally apparent if its application to shop, warehouse, and other property was considered. In no case did it necessarily bear any relation whatever to the income of the person taxed, and in every case it was equivalent to a tax on the industry of the country—a tax which in those days of keen competition and one-sided free trade the industry of the country was unable to bear.

STONEHENGE.

IT was stated by Dr. Stevens, of Reading, that he had authority for believing that fragments of the great monoliths at Stonehenge were removed. Sir Edmund Antrobus, the owner, in writing to a local paper, says:—

I believe the facts to be far different from those which Mr. Stevens assumes as unquestionable. If, however, Mr. Stevens would furnish me with the name of his friend, and we could find the stone on which the fragment would fit, it would furnish an excellent opportunity to test the working of the Ancient Monuments Preservation Act, but I am doubtful of the source whence most of these specimens are derived.

Some forty years ago my father received a communication to the effect that a shepherd was selling specimen bits of Stonehenge, wholesale. He rode up, and having business habits, first made an examination of the monument, with the view of discovering whence the specimens had been taken. He was unable to do so, and, finding the shepherd, spoke to him, telling him of the charge made. "Lor' bless ee," said the man, with a broad grin on his face, and in the broadest Wilts vernacular, "I wouldn't hurt the old stöans. Now when they ploughed over the barrow" (pointing to a low one in the neighbourhood) "they ploughed up a lot of bits, which, I s'pose, they as put up the old stöans buried there, and I always has two or three bits in my pocket, and when one of they archilogical chaps says, 'Shepherd, can ee get I a bit of the old stöans,' 'Yes, sir,' says I, 'if so be as you'll please not to tell Sir Edmund,' and I gets half a crown and the old stöans aint never the worse." The connection, if it existed at all, between the specimens and the monument, was purely pre-historic. I believe, with the exception of the case of the Oxford Professor, who on the principle of "detur digniori" endowed his University with a few grains of each of the more remarkable specimens, nothing is carried away; but the idea undoubtedly exists that such injury is of constant and daily infliction. Some few months back, after perusal of a remarkable document, purporting to give a view of the present state of Stonehenge, and implying, so far as I recollect (I have not got it to hand), that in the vast majority of cases the damage was of recent occurrence, I went up, and whilst making examination as to any damage thus recently effected, was accosted by an elderly gentleman, who, remarking that he understood I had an interest in the place, observed that it was being carried away "wholesale and piecemeal." I expressed my regret, and asked him to show me some of the damage of recent date. I followed him half round the monument. At last, pointing to two undeniable abrasions, "There, sir," said he, "what do you say to that, and that?" "Well," I replied, "I have nearly sixty years' acquaintance with the monument, and know something of the colour the stones exhibit when recently injured. Will you," I asked, "give me the assurance that either of those abrasions has taken place within fifty years?" He looked me hard in the face, and walked away. The last words I heard him muttering were, "Wholesale and piecemeal! wholesale and piecemeal!" Without a doubt, on reaching home, he wrote an account to his local paper.

If the damage done in the last ten or twenty years were fairly and thoroughly estimated, it would be found that with each year greater respect was shown and less damage done to our great Wiltshire monument, and this notwithstanding that no iron railing is interposed to obstruct spectators, no guardian, as suggested, to utter the mandate of "move on," and that picnickers are still allowed to eat a bun or sandwich within the circle.

The *genus irritabile* of the archæologists have determined on its annexation, and in these days to covet is sufficient justification for attack, and for that purpose nothing is so available as, to say the least, misrepresentation.

SOCIETY OF ANTIQUARIES OF SCOTLAND.

THE first monthly meeting of the present session was held on Monday, Professor Norman Macpherson, vice-president, in the chair. The first paper was an account of the prehistoric forts of Peeblesshire, by Dr. David Christison. Circumstances had favoured his investigation of the area of Peeblesshire, in which there was a total number of eighty-one fortified sites known, although of these there are only about twenty-four in fair preservation. Roughly speaking, these forts might be divided into two classes, the first consisting of forts constructed of stones only, and these are usually distinguished by the absence of earthworks and trenches. They are ten in number, and perhaps the most remarkable of these is that of Cademuir Hill, in which the main wall of the fort has been strongly built, and several annexes clustered round the main enclosure. The second class of forts, those constructed of earthworks, includes several varieties—(1) with a single rampart, (2) with a double rampart, of which there is a good example called the Harehope Rings, (3) of more complex form, as at Whiteside, which has four concentric rings of defence and platforms within the inner ring. There was yet another class of forts placed in valleys or on ground which gave them no advantage of position, and this fact seemed to show that the term "hill-forts" was too restricted to be applied as a generic term to the whole of our prehistoric forts. Considering these fortified sites generally, there was one thing which seemed to point to the conclusion that they could not have been for permanent occupation, namely, the absence of a water supply. The second paper, by Mr. James Macintosh Gow, dealt with the antiquities of the neighbourhood of Balquhidder. Mr. Gow described the remains of a stone circle which seemed to have been about thirty feet in diameter, and of which only one stone remained erect. Close to the high road lies a large granitic boulder, 8 feet by 5, and standing 2 feet out of the

ground, in the upper part of which is a basin 18 inches in diameter and 6 inches deep, which is still called "The Priest's Basin," and is supposed to have been used as a font for baptism. Mr. Gow, while spending a holiday, searched the district for cup-marked stones, and was fortunate in discovering three on the farm of Wester Achleskine and one on the farm of Gart-na-Fuaran, on the opposite side of the stream. In the third paper, Mr. Ivison Macadam dealt with the ancient iron industry of Scotland, remarking that, beyond scattered notices of the masses of metal or cinders in various parts of the country, little or nothing was known of the extent and characteristics of this industry. A list of nearly one hundred bloomeries had now been obtained, and was still being added to. These primitive ironworks might be divided roughly into (1) those that used only ore and fuel, and (2) those in which a flux was also added. In the first case the slag was dark, while the second series gave light lime slags very similar to those now produced in ironworks. The ore used in most cases was bog-iron, but occasionally red iron ore was employed, and even clay-band iron stone. The two latter varieties were imported from England. The fuel was wood or peat-charcoal, large supplies of which could be obtained in the neighbourhood of most of the sites of these old ironworks. Mr. Ivison Macadam quoted documents to show how well known the west of Scotland especially was to the English ironstone masters during the reign of Queen Elizabeth. Professor Macpherson exhibited an interesting silver chalice, the property of Mr. Macleod, of Cadbole, which is beautifully chased on the exterior with Celtic patterns of the same character as those on the West Highland slabs, and bears on the inside, engraved on the bottom of the cup, a shield of arms quartered apparently of Macleod, but not exactly answering to any known Macleod shield. Another cup of taller form, also from Cadbole, was likewise exhibited.

Bygones.

"Antiquity after a time has the grace of novelty."—HAZLITT.

A LIVERPOOL CATHEDRAL PROJECT IN 1827.

LIVERPOOL has not long enjoyed the dignity of being the seat of a bishop, and this is the more strange when we remember that it used to be represented by influential statesmen. However, various attempts were made from time to time to make the town a cathedral city. One of them was about sixty years ago. The following article from a publication of the time will suggest what was thought of the project, and give rise to reflections about the difference between Then and Now:—

Projected Cathedral at Liverpool.

The Corporation of Liverpool are said to have solicited the erection of a bishopric, for which they are in return to show their zeal by the erection of a cathedral. The bishopric is to be composed of the diocese of the Isle of Man, and a fragment of that of Chester. The diocese of Man is an absurd anomaly in the Establishment, for it makes His Grace the Duke of Athol head of a church, and gives him the disposal of a mitre, which, of course, always falls on the head of the "gude blude." This strange privilege ought to be extinguished, and probably will, by the way most congenial to the pockets of the great dispensers of the good things of this world. But the formation of a new diocese out of that of Chester may have its difficulties. Chester is an immense diocese, extending over a considerable part of the north-west, even into Yorkshire; but it has the episcopal objection of being rather unproductive as it is. Such a bishop as Bishop Blomfield deserves the richest see of them all; and even if he should be translated, his successor will have to stomach the mortification.

But the proposal of the Liverpool people is more obnoxious. To build a cathedral would be to embark in a tremendous expense for no useful object under the sun. Cathedrals were the natural growth of the monkish system. When rival abbots laboured to attract popular favour to their pious fooleries, by exciting popular wonder, the cathedral, too, was the scene of rival ambition. Nothing could better show off the idolatrous tricks or the pompous train of this early prelacy. The cathedral, besides, gave the chief employment that men of monkish seclusion could find for the exercise of their tastes in architecture, which were sometimes cultivated in Italy, and were admirable. The expense of the building was unimportant to those who received immense sums of money which they had but few other means of employing; the work gave occupation to artists and the peasantry. It was equivalent to the manufacturing occupation of later days, and at once made the brotherhood popular, serviceable to the district, comfortable and stately in their dwellings, and secure in the possession of a property which could not be taken from them by the common predatory habits of the time. They produced noble buildings, and however it is to be regretted that the enormous sums laid out on them were not better employed in the popular education, in the propagation of science, or in works of humanity and charity, yet here we have them, and it would be culpable to let them go to decay. But the idea of building new cathedrals is totally absurd, extravagant, and useless. The modern expense of building a single cathedral on the old scale—and to build it on any other must be beggarly—would actually erect fifty tolerable churches, which are as much wanting in the northern parts of the diocese of Chester as in any other quarter of the kingdom; would repair all the glebe-houses; would erect and furnish a hospital in every town in Lancashire, and, in short, do a multitude of most useful and most necessary things. The best cathedral that we could build would be a bad one, for economy would, of course, be among the principles of the founders. But economy has nothing to do with the lavish expenditure that alone could make one of those edifices in any degree correspondent to the name. We should have a bad cathedral, probably never more than half-finished; for the funds and the zeal of the Corporation would soon be equally exhausted by the expenditure, which would so soon be discovered to be totally misapplied.

The fact is, that the whole cathedral system is, to the mind even of churchmen, the most cumbrous and inefficient part of the Church polity. The reformers, however, were forced to take it as it was—edifice, form of government, and state of revenue. The prebends were once little better than sinecures; and though they are now often given to men diligently employed in parishes, or perhaps as the rewards of literature, they are obnoxious from their being connected with scarcely any other actual duty than that of sitting in a stall twice a day, for a month or two in a year, for an hour at a time, which is called residence, and which any man alive may do, and devote the rest of his existence to lounging at a watering-place, touring on the Continent, or going pleasantly through the nothingness of London life. This is not said in a spirit of reproach to the general spirit of the British ecclesiastics, for they uniformly, when they have any sense of the infinitely solemn importance of their duty, regret this temptation to indolence, a temptation which is besides chiefly reserved for men willing enough already to save themselves trouble—the sons and connections of the higher orders. The whole system ought to be revised. The stalls ought to be connected with positive duties. The cathedrals ought to be turned into colleges for theological education, or for some public purpose connected with the public knowledge. The stalls ought to be given to clergymen distinguished by their literature, and who would be actual professors. It is singular that in England, the Protestant head of Europe, and the actual stronghold of whatever religious truth subsists among men, there is no institution for religious education. In the Universities it forms an altogether subordinate branch, and the divine is left to hunt out his knowledge as well as he can.

What is the practical value of St. Paul's and Westminster Abbey as churches? Next to nothing. A corner is railed off, in which a service is chanted, which during the week nobody attends, which on Sundays is attended by no more than the ordinary congregation of any of the small churches, and which is the most incongruous and unsuitable form of service, as any one will know who attempts to sing his prayers. The cathedral and its service are equally the legacy of Papal times. St. Paul's and Westminster Abbey are actually little better than cemeteries, and very fine ones they are; and it is well, on the whole, that we have such receptacles for our national monuments. But as there are no such uses for our country cathedrals, however it may be right to keep them up, the Liverpool Corporation will act wisely in thinking a little before they fling away their money on a mountain of stone, useless to every purpose but those of the contractors for the stones, and the idle, who may be pleased to promenade its aisles. Let them build churches, hospitals, and almshouses, if they have money to dispose of and desire to dispose of it usefully.

CHURCH BUILDING AND RESTORATION.

Ipswich.—The restoration of the tower of St. Nicholas's Church has been completed. The work has been carried out by Mr. G. Nevard, of Nayland, under the direction of Mr. E. F. Bisshopp, architect, Ipswich.

Lasswade.—The parish church has been reopened after repairs. The heating of the church, which had always been defective, was entrusted to Mr. Grundy, of London. The necessary repairs and painting of the church have been carried out under the direction of Messrs. Hardy & Wight, architects.

Liverpool.—The church erected for the Roman Catholics, Mount Vernon Street, has been opened. The church is in the Decorated style, and is built to accommodate 800 people. It consists of a nave, 10 feet by 29 feet; north and south aisles,

83 feet 6 inches by 13 feet; and chancel, 23 feet by 29 feet, thus having an intermeasurement of 141 feet 4 inches. At the east end of both aisles are chapels; at the west end of the north aisle a baptistery, and the corresponding end of the south aisle a large committee-room. At the south-east corner are two large sacristies, first a boys' and working sacristy, opening into the church, and beyond this the priests' sacristy, in direct communication with the presbytery. The architects were Messrs. Goldie, Child & Goldie, and the general contractor Mr. M. Fogarty (Old Swan), Liverpool.

Witham.—The Congregational chapel at Witham has been reopened after renovation under the direction of Mr. Charles Pertwee, architect, of Chelmsford. The heating of the church and schoolrooms in the rear has been carried out by Mr. John Grundy, of London. The general works have been carried out y Mr. Joseph Smith, builder, of Chipping Hill.

SCHOOL BUILDINGS.

Basingstoke.—The foundation-stone of schools to be erected for the Basingstoke School Board has been laid. The architect is Mr. Charles Bell, of London, and the contractor, Mr. H. J. Goodall, of Basingstoke. The buildings will be in two blocks—one for the infants and the other for the older scholars—and the material used flint, with brick dressings; the central hall principle—classrooms leading out from the hall—is adopted. The contract price is 10,351*l.*

Glasgow.—An extensive addition to the Garnethill public school has been opened, accommodation being provided for between 1,500 and 1,600 scholars, at a cost of 8,309*l.*, a total of 11,000*l.* with cost of site, &c. The buildings were designed by Mr. W. F. M'Gibbon, architect, and Mr. John Thomson was clerk of works.

York.—A building to serve as Mission church and schools has been opened in the Foundry district. The ground-floor is reserved for school purposes, and above is the Mission church room. The contractors were:—Mr. W. Biscomb, brickwork and masonry; joiner work, Mr. H. Creaser, jun.; slating, Messrs. J. Dodgson & Sons; plastering, Messrs. Rawlings & Sons; plumbing and glazing, Mr. J. H. Shouksmith; painting, Messrs. Bellerby & Sons; and ironwork, Mr. W. Thomlinson Walker, all of York. The architect was Mr. C. Hornsey, Railway Street, York.

NEW BUILDINGS.

Bolton.—A new mission-room was opened recently in connection with St. Matthew's parish, Bolton. It is a well-proportioned room to seat some 200 persons, neatly fitted up with comfortable benches, and having pulpit, prayer-desk, lectern, communion-table, and choir stalls, all of pitch pine, well made and of very pleasing appearance, being constructed by Mr. J. Pearson, of Pendleton. The total cost of the building and furnishing is about 850*l.* Messrs. Stead & Morris, Bolton, were the architects.

Conservative Club, Birmingham.—This building, which is almost completed, stands in Temple Row, and faces the Burnaby Memorial. The style adopted is a Roman type of the early Italian Renaissance, and the chief features of the front are the boldly outlined entrance portico and lofty bay windows, which are carried up on either side to the level of the third storey, with balconies and parapets on the two principal floors. The main entrance from the street is by a broad flight of steps beneath the portico, and leading to the ground floor, which is raised sufficiently above the street level to secure the privacy of members from curious passers-by. The whole of the façade is in Portland and Hollington stone. The vestibule has large inner and outer screens, filled with enamelled glass. The hall is paved with mosaic tiles. To the left is a morning and writing-room, 50 feet by 30 feet, lighted from the front by a large bay window filled with plain plate glass, and in the rear by a smaller window of enamelled glass. The staircase hall, as it is called, is 30 feet by 25 feet, has a wide open fireplace on one side, and is lighted by large windows of enamelled glass on the staircase and also by a lantern in the roof. The staircase runs from the ground to the second floor, and the guard is a beautifully worked open wrought-iron scroll balustrade, manufactured by Messrs. Brawn & Co., of Birmingham. From the staircase hall a wide corridor leads to a luncheon room, 50 feet by 26 feet, and correspondingly lofty, lighted by windows which look into a conservatory running the entire length of the room. On the ground floor are also serving-rooms, a steward's-room, a bar office, strangers'-rooms, a telephone-room, and cloak-room accommodation. On the first floor the front of the building is occupied by the great dining-room, 50 feet long by 43 feet wide. Behind are a card-room, 25 feet by 22 feet 6 inches, a large billiard-room, and a smaller billiard-room lighted from the roof. The large one has a floor space of 32 feet by 26 feet, and the other is 24 feet by 20 feet. On the second floor, in the front are the smoking-room, 50 feet by 22 feet, and a private dining-room, 34 feet by 18 feet. The remainder of this floor and the whole of the upper storey are occupied by the steward's and servants' apartments, store-rooms, &c. On each of the floors ample lavatory and dressing-room accommodation is provided. Throughout the building the staircases, corridors, and halls are of fireproof construction, and the ventilating appliances and heating apparatus are of the most modern character, supplied by the Æolus Company. Where the exterior of the building is not of stone, the material employed is a peculiarly hard glazed white brick, and internally the walls are partly in panel and partly in cement, painted and coloured in distemper. Messrs. Barnsley & Sons, of Byland Street, have carried out the whole of the building work. The architects are Messrs. Osborn & Reading.

GENERAL.

The Painting of a ceiling decoration by Sir Frederick Leighton, P.R.A., which was shown in the Liverpool Autumn Exhibition, has been shipped to New York for Mr. H. G. Masquand, who purchased it prior to the Exhibition.

The Third Exhibition of Pictures will be opened in the Leeds Corporation Galleries next week.

A Fine Art Gallery is proposed to be erected in Dundee during the Jubilee year.

Mr. John Hutchison, R.S.A., was, at the last special general meeting of the Royal Scottish Academy, elected treasurer of the Academy.

Mr. B. J. E. Bruce, of Hull, has been appointed engineer of the Hull Waterworks.

Two Norman Arches have been discovered in the south aisle of the chancel of the parish church of Hythe. It is, therefore, concluded that the Norman church which once stood on the site was of large size.

Mr. R. Vawser, C.E., of Manchester, will prepare for the Royton Local Board plans, sections, and estimates for the works required for dealing with the drainage and sewage of the district.

The "Scotsman" says that after protracted negotiations, the French Exhibition authorities have finally determined not to purchase the Old Edinburgh buildings, their refusal being based on the ground that they have been exhibited before. Mr. Pender, who has conducted the negotiations, has, it would appear, asked the architect to delay the destruction of the buildings, as he hopes to induce the South Australian authorities to acquire them in connection with their Exhibition in 1887.

The Bassett Tomb, in Blore-Ray Church, Staffordshire, has been restored under the direction of Mr. Charles Lynam, architect, who has also made a report on the condition of some beautiful recumbent thirteenth-century effigies at present unprotected in Stone churchyard.

The Heavy Gale of Wednesday night in last week brought down an immense zinc cowl, weighing between two and three cwt., recently erected on the Grosvenor Gallery for electric-light purposes, from the top of the roof through the skylight of Messrs. Dowdeswell's gallery, causing considerable damage.

The Dunnottar School Board, Stonehaven, at their meeting on Thursday in last week resolved to invite competitive plans for a school to accommodate 500 pupils.

A New Cathedral is to be built in Pekin by the Lazarists on a fresh site, at the expense of the Chinese Government.

The Memorial of the Late Archbishop Whately has been removed from the northern to the southern transept of St. Patrick's Cathedral, Dublin, and is now surrounded by a brass railing.

A Committee of the Corporation has been appointed in Gloucester to consider and report on the question of providing improved municipal buildings for the city.

The Gordon Boys' Memorial Institute, Liverpool, was opened on Saturday by the Mayor. The building has been erected at the sole cost of Mr. W. Cliff, from the designs of Mr. David Walker.

Glasgow Bridge is to be widened according to plans prepared by Mr. D. Miller, C.E. The estimated cost is 31,710*l.* It has yet to be decided whether a larger amount of work will be ordered.

An Arbitration between the Hull and Barnsley Railway Company and Mr. Shelford, C.E., who claims 16,269*l.* for professional services, was opened at the Surveyors' Institute on Wednesday.

The Chester Archæological Society held its monthly meeting on Monday evening, when Mr. Alfred Rimmer, joint author with the late Dean Howson of "Ancient Streets and Homesteads of England," read a paper entitled "The Black and White, or Half-timber Architecture of England, with a Special Reference to its Development in Chester and the Neighbourhood."

The Architect.

THE WEEK.

OBJECTIONS were raised against the arrangements which were proposed in respect of architectural designs in the forthcoming Jubilee Exhibition in Manchester, and it might be assumed that very few architects would care to send works under the conditions. The committee have, however, grown wiser, and it is now announced that the whole work of collecting, selecting, and hanging such drawings as will illustrate the progress of architecture in the United Kingdom during the half century, has been entrusted to the Manchester Society of Architects. It may now be taken for certain that the display of drawings will be worthy of the occasion, and form one of the most interesting sections of the Exhibition.

MR. A. M'KAY is preparing a catalogue of the collection of prints belonging to the Duke of BUCCLEUCH, which will be sold by auction in the spring at CHRISTIE'S. They will comprise (1) a nearly complete collection of REMBRANDT'S etchings, wanting only a few which are almost unique or doubtful—the etchings come from the AYLESFORD, ESDAILE, HAWKINS, VERSTOLK, and other collections, and several are in various states; (2) the complete etched work of OSTADE; (3) the complete etched work of VANDYKE, in the finest states; (4) a nearly complete collection of the works of ALBERT DÜRER, including the rare etchings on iron plates; (5) works of MARC ANTONIO and other Italian engravers; (6) a complete collection of the engraved works of Sir JOSHUA REYNOLDS, in the finest proof states; (7) a superb copy of TURNER'S *Liber Studiorum*, including etchings and engraver's proofs; (8) a complete collection of the engraved works of LANDSEER, the proofs being in progressive states, from the etchings to the finished copies.

IT is satisfactory to find the Chairman of the London School Board advocating the teaching of drawing in the metropolitan schools. The Rev. Mr. DIGGLE bases his recommendation on the educational value of drawing. He knows that comparatively few people are able to convey a notion clearly of any question that relates to form and size; and, as he is aware that even a little skill in using the pencil would make up the deficiency, the Chairman therefore advises the teachers and pupils to find an interest in the subject. Anyone who has observed what takes place in a foreign school can testify that the lessons in drawing appear to be the most attractive part of the curriculum for the pupils. It is rather early to criticise the work of the drawing-classes in the English Board schools, but vigorous efforts will have to be made before it can bear comparison with the drawings by the students of the Christian Brothers' schools abroad, or even with the drawings from the municipal schools.

ANYONE who has had opportunities to compare the procedure in the Superior Courts of England and Ireland is not likely to be convinced that there is a better system in the Sister Isle. A case was heard a few days ago in Dublin which will be suggestive of the difference between the two countries. A firm of builders in Limerick sought to recover 325*l.* 9*s.* from a lady in Clare who is the owner of a building called Dangan Castle, which must not be confounded with the building in Meath where the Duke of WELLINGTON was said to be born. The case was first tried at the Limerick Assizes in the summer. The defence then set up was that the works were not complete, and that Mr. R. FOGARTY, the architect, had not given his certificate. It is supposed in England that an architect's certificate is a condition precedent to a claim of the kind, but apparently there is less reverence for the document in Munster, for the jury returned a verdict for 200*l.* 9*s.* The plaintiffs were dissatisfied and brought the case before the Superior Courts in Dublin. It was there decided that the jury should have been told to find for the defendant, owing to the absence of the architect's certificate. This was following English precedents without number. But then it was laid down that the defendant had waived her right to the certificate by taking possession of the premises, which had been vacated in order to carry out the repairs. Is not that a novel ruling, unless there was a condition in the contract to that effect? We cannot recall one of the kind. It might even be agreed that the final certificate should not be given until a certain time after occupation. However, if that ruling is law, the plaintiffs ought to have had the amount of their claim or a new trial should be ordered. But the judges considered that a new trial was inexpedient, and, owing to the difficulty of the certificate, the verdict of the jury was allowed to stand, but without bringing costs to the plaintiffs. English builders will pray that the arrangement may not be made a precedent.

AT last the authorities of the districts of Richmond, Barnes, Mortlake, Kew, and Petersham have received permission to borrow 100,000*l.* in order to carry out a joint system of drainage. This is a work which has been the subject of many costly inquiries in which the leading engineers gave evidence. It is proposed to convert some of the fields between Mortlake and Kew into a sort of sewage farm, and allow the effluent water to flow into the Thames. At present much refuse is conveyed in barges and deposited there: it cannot well be said that the district will suffer through the proposed works. The districts between Richmond and Kingston are not comprised in the scheme, and they will probably have to pay again large sums before a solution can be discovered for the sewage difficulty.

WE have already mentioned that the French Minister of War has made arrangements for giving commissions for pictures of military events, which are to be placed in the headquarters of the different regiments. It is needless to say the works will be of a high class. M. BERNE-BELLECOUR has received one of the first commissions. He is to paint the bravery of the battery commanded by Colonel GERVAIS at the siege of Sebastopol. The picture is to be assigned to the First Regiment of Engineers.

IT is now calculated that, when all debts are paid, there will be a surplus of ten or eleven thousands of pounds from the Edinburgh Exhibition. What will be done with the money has to be determined, but the exhibitors desire to have gold, silver, and bronze medals instead of pictorial certificates, and in that way they would save the committee from the trouble of seeking an outlet for at least four of the thousands. Exhibitors must be credited with knowing what is best for their business, otherwise a certificate that is well designed tells better as an advertisement than a medal. It is necessary for medals to be small in size; it is very rarely that one of them bears a figure or a device that calls for attention; while, owing to the number of medals representing awards from big and little exhibitions during thirty-five years, it is difficult to discriminate between them and to discern a new addition. If certificates are designed by an artist—and no others should be employed—they are free from many of the objections that apply to medals. There is, moreover, a legal difficulty to granting medals, unless with the sanction of the Board of Trade. According to the Solicitor-General for Scotland, a disposal of the surplus in that way is illegal, since in the memorandum of association for promoting the Exhibition it was distinctly stated that the surplus was to be applied to some institution.

THE excavations in Lincoln Cathedral were rewarded by the discovery, in the south aisle of the choir, of a portion of the foundation of the original eastern termination of the cathedral as erected by ST. HUGH, subsequently taken down for building the Angel Choir. This is supposed to prove that ST. HUGH'S church ended in a polygonal apse with chapels attached, somewhat resembling that at Westminster Abbey. The apse formed a semi-hexagon with semi-circular chapels, similar to those of the eastern transept, projecting from the two sloping sides, and a polygonal chapel, forming a complete hexagon, attached to the eastern wall. This was probably the Lady Chapel. Between this chapel and the semicircular chapels on either side there is a small circular appendage, the purpose of which is not very evident. Under the table of black marble erected about 1670 by Bishop FISHER, a stone coffin has also been found, and it is imagined that it may have contained the body of ST. HUGH.

THE CHICAGO CONVENTION.

THE annual meetings of the architects of the Western States of America are always important events. They are well attended, and the proceedings are conducted in a spirit that is suggestive of a friendly feeling among those present. The difficulties that attend the profession of architecture are much the same all over the world, and many things that are said in Chicago or one of the Western cities on those occasions will be found to have a general application. In addition, there is the interest which springs from kinship. The doings of American architects are watched in England with an attention that is very different to what is given to the works or the speculations of continental architects.

This year the Convention at Chicago was under the presidency of Mr. D. ADLER, and he began his address by congratulating the members on their privilege "in being part, not of a renaissance, but of a naissance in architecture," for, as he said, a new style, a style that was representative of the nineteenth century, of America, and of civilisation, was surely being born into the world. Mr. ADLER was able to point to the fact that there was a growth of power among American architects, and he referred to the earlier and later works of such men as RICHARDSON and ROOT in proof of his theory. There is no doubt that in America architecture is not so trammelled by precedent as it is in England and in Europe, and if Mr. RICHARDSON had lived for a longer time much more would have been achieved. It is to the credit of the new school that, in allowing their imagination some play, there is not much desire to be fantastic. The later American buildings err, if at all, in being over severe and solid. If any of them are suggestive of European or other models, the President claimed to consider the treatment as distinctively American.

But the new architecture is exemplified in the private rather than in the public buildings of the country, and owing to the influence which the latter must exercise upon the architecture of the future, Mr. ADLER had much to say upon the unsatisfactory way in which authorities give their commissions. The competitions are not always conducted fairly, and if the judges are disposed to be honest, they are liable to be captivated by showy drawings. Mr. ADLER, it is evident, would bring back the days when competition was not supposed to be the only means to obtain a satisfactory building, and his desire is inspired as much by the client's interest as by the architect's. "In competitions," he said, "the immediate personal contact and intimacy, the free interchange of ideas between projectors or owners of the proposed buildings and competing architects becomes to a great extent an impossibility. The more fair, the more honest the competition, the more complete the isolation of client and architect. Hence the resulting designs can attain only academic perfection, and will be deficient in the sympathetic, life-giving qualities; this implies a loss to the owners of the building, to the public at large, and to our profession." These are remarkable words, especially when it is remembered that they are heard in a country where go-aheadness and competition are supposed to be equivalent terms. But American shrewdness may be trusted to discover that architectural competition is a species in itself. If a producer of wooden nutmegs is beaten out of one market by cheaper and more deceptive imitations, the country is wide enough to afford him another chance to dispose of his products. Architects are not so fortunate. Mr. ADLER referred to a recent competition which was so honestly conducted as to be styled "the best, almost the ideal, competition." What was the result when considered presidentially? We are told that "forty-seven architects expended an aggregate of probably 25,000 dols. in cash, or its equivalent, and an aggregate of vital energy worth many times as much if applied to the prosecution of their legitimate business, and all for the chance that one of their number be given the opportunity to earn by hard work and the further expenditure of 7,500 dols., the sum of 20,000 dols. and the glory of having vanquished his fellows in fair and open combat." In England enterprise of the kind is taken as a matter of course. America has a chance of showing us the advantages of a less hazardous system.

The first report that was read at the Convention was on a subject that excites much interest among American architects, namely, the regulation of the office of Supervising Architect. A Bill on the subject was introduced into Congress, and architects were told off to try their hands in "lobbying," so as to make it law. But they were compelled to confess that "the attitude of the members of the Committee on Public Buildings and Grounds seemed to be one of indifference"—a description that might have been taken from a committee of our Lords or Commons. There is no hope of passing the Bill in the present Congress, but who can tell what may be done when a different set of representatives are installed in Washington?

The committee on the subject, and those on several other matters that were also unsuccessful in their efforts, were reappointed. The architectural societies of America seem to have local committees without end. As ladies are allowed the privileges of membership, it is not surprising to find it announced in official English that "Mrs. BETHUNE, your committee from New York, has organised a Buffalo society of architects, fourteen members, who are working in a harmonious manner, and has turned her attention to the various other cities in the State with prospect of success." Happy are the societies that can boast of canvassers with so much energy.

It is easier for any one to dignify himself with the title of architect in America than in England, for there it is less practicable to discover a man's antecedents, and how he was trained in the art. The question of membership must, therefore, be a standing difficulty with American societies for many years to come. At the last Convention one candidate did not condescend to adopt the usual course of asking a member to recommend him, and we suppose so much independence will be no obstacle to admission. It was also found that, in other cases, members who had recommended candidates were not aware of the regulations by which membership is restricted to those who are engaged in the exclusive practice of architecture. As far as we can judge, there is no desire in the Western Association of Architects to reject a candidate unless there are very strong reasons against an association with him. Hitherto the practice appears to have been for names to be submitted, and if the directors or Council of the Association approve of them, the applicants are recommended in a batch for adoption at one of the meetings of the Convention. It is asked by the President if there are any objections to the admissions, and if, as commonly happens, there is no expression of dissent, that is taken as election. It does not follow that there is no latent dissent. It is proposed to change the system and to adopt vote by ballot, with a provision that five adverse votes will bring rejection. Opinion was divided on the merits of the proposal. Some thought that as every architect must have enemies, there would be little difficulty in finding five opponents at an election, while others were confident that it would be almost impossible, assuming that the candidate was an architect of standing. Every one will wish that the latter view should be representative of opinion in America.

In the Western States, as in England, there are architects who are of opinion that they would be gainers if they received periodically a diploma or certificate which they could display to their clients. But the good sense of the majority at the last Convention was against the proposal. One member advocated it for the reason that it might help members to recover their fees, on the ground of belonging to a Society which had a fixed scale of charges for work. At present, he said, it was possible to obtain architects as witnesses who would declare that they were willing to work at one-half the rate of the charges contested. But it was shown that the American Courts would not pay attention to any certificates of membership, and finally the subject was put off for another year.

The papers which were read merit a separate notice, but there was one exceptional resolution which is worth attention in other places. It was proposed by Mr. J. M. ROOT that a blank form should be prepared by the Association and supplied to the members, who were to fill it up with such information about the strength of a building as it was advisable to give a client. A building intended for one purpose is often used for one that is entirely different, and instead of light manufactures it may have to sustain the strains arising from heavy loads. If it were

stated to every owner that his building was equal to so much work and no more, then the responsibility for many dangerous contingencies would be removed from the architect.

MR. CHRISTIAN'S REPORT ON THE DESIGNS FOR THE LIVERPOOL CATHEDRAL.

(*Continued from page* 349.)

Mr. Brooks.

IN dealing with the site Mr. Brooks takes it as it stands, and makes no suggestion as to the possibilities of the future.

He carries the projecting portions of his building close up to the northern boundary in William Brown Street, and pitches the level of his floor so as to allow of access by steps on the north and west sides, and by carriage road on the south. This requires a descent on to the site by thirteen steps at the north-east corner. Under the nave, aisles, and chapter-house he proposes a crypt, but although it would be spacious, and at the sides well-lighted, he does not appropriate it to any particular use, the cathedral offices being provided for elsewhere. Considering the large space available, this is somewhat of a waste, as there is in the two aisles alone, eastward of the baptistery foundations, a larger area than in the available ground floor of the subsidiary building proposed next St. John's Lane. Mr. Brooks says nothing of the reinterment of remains from the churchyard; but it could be abundantly provided for within the foundation-walls of the church.

As regards structure, Mr. Brooks's plan is a very fine one, carefully studied on pure Mediæval principles, but freely treated with a view to modern requirements. Mr. Brooks states the width of the nave to be 50 feet, but that dimension is taken to the centre of the pillars, and the clear actual width does not exceed 45 feet. The general area is very free and open; the choir is large and commodious, and stalls and seats are provided therein for 118 adults. The choir has north and south aisles, and an ambulatory round the apse. The morning chapel, which is shown to be separated from the aisle by metal screens, is ample in size, and there is a fine baptistery at the south-west corner of the nave.

The vestries for the bishop, dean, and canons, are on the ground floor, and over them choir vestry and muniment-room.

The doorways, twelve in number of openings, are very ample for entrance and exit of large congregations, and the western portals are of grand proportions.

Two points of importance in Mr. Brooks's design require special mention, namely:—

1. The placing of the two western towers clear of the main structure, thereby securing great width of western frontage. 2. The complete and lofty well-lighted triforium gallery over the aisles, which is continued entirely round the church, and carried at the end of the nave over the western portals. It it possible that Mr. Brooks may have exaggerated the value of this in a utilitarian sense, but there can be no doubt that it would be a very fine architectural feature, and not unfrequently one of considerable importance for the easement of crowded congregations. Over the north aisle of the choir also it affords fine space for an organ of the largest size. The weak point in connection with it is that the six staircases giving access are all circular, with a clear gangway of only 3 feet, which in case of a crowd would hardly be adequate, except under restriction.

Another fine feature in Mr. Brooks's interior design is the lofty open lantern tower at the crossing: this would give good light to the centre of the church, and could not fail of being beautiful as well as useful.

It is somewhat difficult to estimate the numbers that could conveniently see and hear in a church of this construction; and an exact statement on this head would be almost necessarily misleading, but it may be safely stated at not less than 3,500, though for some services it might largely exceed that number.

As regards architectural features, Mr. Brooks says:—

An ecclesiastical building of leading character, surrounded with magnificent buildings of some form of Classic architecture, should necessarily be marked by a distinctive style, such as is adopted in connection with the religious worship of the country; and such a building would form a pleasing contrast to those around it. In pursuance of this idea, I have endeavoured to produce harmony, as it were, with existing buildings, while retaining the distinctive features of the style which I have chosen. For instance, horizontality is obtained by the ranges of windows, string courses, parapets, &c., and the constructive distinctions of the Pointed style are maintained in the high-pitched roofs, the flying buttresses, the special formation of doors and windows, and the lofty towers and spires. The introduction of the apsidal or circular termination of the east end serves, also, to suggest a contrast with the adjacent pile of St. George's Hall, and gets over the difficulty which might arise from the awkward line that would be produced by a square-ended building, in close proximity, but not at right angles with it.

Mr. Brooks.

He also further remarks:—

The style selected enables me to give windows of a severe type, but these will, in my opinion, harmonise better with the Greek or Classic architecture of the adjoining buildings than would windows having more or less elaborate tracery.

There is truth in this; but it has not precluded his indulging, and notably in the western elevation, in portions of sumptuous decoration, nor need it, for when the main structural lines are strong and bold, as in his design they are, great richness may be indulged in in details near to the eye, or where comprehensible above.

As regards the western façade, I cannot but think that Mr. Brooks has missed a great opportunity. I do not myself see the reason for his varying treatment of the towers, yet doubtless he has one; but the main lines and levels being similar, no mental disturbance is caused thereby.

The portals at the base, and the central composition throughout, are really fine; but the disconnection produced by the falling lines on either side of the nave destroy the great value of the broad façade; a glance at the west front of Lincoln Minster would show the proper treatment, and a few strokes of the pen would give that unity of mass so obviously called for, and make what is now broken and disjointed into a magnificent whole. The want of this is really distressing.

The central lantern tower is somewhat disappointing, and its conversion from a square base into an octagon above still further diminishes the idea of bulk, which should satisfy the eye in a great central feature of so large a structure.

On the northern elevation the most striking and prominent feature is the transept, the treatment of which, with its fine portals, produces what is really a most beautiful composition, stately in outline, solid in structural lines, and rich in detail—a piece of work pleasant to look upon.

The aisles are simple, and may possibly be deemed severe, but their treatment is characteristic and good, and the clerestory is well proportioned.

The eastern front calls for no special observations, and what has been said about the north will, in great measure, apply also to the south, but there are also some important variations.

Viewed as a whole, the design of the exterior is undoubtedly one of noble proportions and vigorous and masculine character, but having regard to the site, I cannot but think that the general structure is excessive in height.

As regards the interior, this remark perhaps would not so strongly apply, but it can hardly be doubted that the great height of the triforium is not attained without some sacrifice in respect of general proportion.

Mr. Brooks is of opinion that the acoustic properties of his church would be good, which I think probable.

As regards the subsidiary buildings, Mr. Brooks provides more than ample accommodation, and considering what might be done with such a crypt as he has designed, I cannot see that such separate buildings are needed.

As regards construction, Mr. Brooks says the material should be—

Of the most durable and lasting character, both as regards resistance to the weather and capability of supporting great weight. The materials for the walls should be of wrought or cut stone, both externally and internally, and with regard to the kind of stone, I should recommend the use of Irish limestone, which is as durable a material as could be employed for all parts of the building, up to the plinth. I think the same stone should be used for the piers of arcades, as its resisting powers are well known, and when wrought with a finely-picked or sanded face its colour is most agreeable. For other portions of the building might be used such stones as Darley Dale or Hollington, the stone used at St. George's Hall. For the external covering of the roofs it is intended to use lead.

As regards the internal vaulting, Mr. Brooks says:—

At this place I should like to give reasons why buildings of this nature should be vaulted. With a vaulted ceiling the atmosphere is less affected by the heat of summer or by the cold of winter than by any other construction, and if from any accident the fittings took fire, the injury would be limited by it, and prevented extending to the roof. With a vaulted ceiling a much more imposing and dignified effect is obtained than is possible from timber construction. Vaulted ceilings, as I have designed these, are by far the best for acoustic purposes, as, for instance, may be observed in the case of Westminster Abbey, which has an apsidal end.

As regards cost, Mr. Brooks says:—

Having gone carefully into the cost, and given due consideration to this part of the subject, and having had, moreover, a long experience in church building, many of my churches being of considerable magnitude, I am of opinion that the magnificent sum provided for this work will be sufficient for the purpose, and my views are confirmed by the opinions of others who have gone with me into this matter.

Having myself had the quantities tested, I believe I may safely confirm Mr. Brooks's opinion on this point.

Messrs. Bodley & Garner.

These gentlemen, like Mr. Brooks, take the site as it stands, and have made their plans to suit its present boundaries, but they say :—

On the plan supplied to us by the committee, the space allotted to the cathedral is not, in our opinion, quite sufficient. The cathedral we have designed is, indeed, contained within its limits, and one bay of the nave could be omitted if necessary; but we feel that it approaches too closely to St. George's Hall, and that it would be most desirable to remove it a little westward. The scale of the building could be slightly reduced without alteration of the design, and so more space be gained, if it is thought desirable. We have indicated this on a suggestive plan for the rearrangement of the site, and there does not seem to be any difficulty in the way, as there is a large open space in front of the site already which is now occupied by the weighing-machine.

But we think also that the removal of the mean and unsightly modern houses at the west end is merely a question of time, and that a plan for the rearrangement of this portion of the town will form a part of the cathedral scheme. In our present plan, however, we should only require about 25 or 30 feet more, and this the open space at the west end easily affords us.

As regards the last remark, I presume Messrs. Bodley & Garner mean that more length is required in order to clear St. George's Hall, to which their building is undoubtedly too near, but there is no real necessity for making it so long.

They further say—

Although we feel the advantages of the present site, and that it would be quite possible successfully to grapple with its difficulties, we think it should be a matter of careful consideration whether another site should not be selected, as the one proposed is certainly very confined. Another objection, and a still stronger one to our minds, is the fact that the cathedral will stand half-way up the hill which is crowned by the fine building of St. George's Hall. It will be difficult to give proper prominence to the one building without in some degree detracting from the dignity of the other, as they are in such close proximity.

This brings us to the consideration of how far the present site must affect the choice of style. Surrounded as it is by a series of unusually fine buildings of the Classic style, it becomes at once a question how far they should influence the style of the cathedral. We have no doubt at all that, for the reasons stated at the beginning of this report, a new cathedral should be English rather than Italian, but we also think that it is extremely important that the different uses to which the buildings are dedicated should be at once apparent. There is great danger that a group of buildings, arranged as they must be, very closely, and designed in the same style should be confused together. The cathedral must, of course, be the most important in every way, but it would not occupy the place of honour, which is already occupied by St. George's Hall; and we think that it would be difficult, if not impossible, to prevent the latter from appearing a part of the former. Of course the group would, architecturally, be very fine.

I agree with the last remark, but not with that which precedes it, about St. George's Hall. It would be no advantage to the cathedral to occupy the position of the latter, but rather the contrary, on account of the constant noise of unintermitting traffic; and the principal view of a cathedral church should be from the westward, which gives the natural approach; and under the conditions of possible improvements to which I have elsewhere alluded, there can be little doubt but that difficulties seen by Messrs. Bodley & Garner have no real foundation. The hall and cathedral would, as I believe, be a mutual advantage, but in Messrs. Bodley & Garner's design, to give proper space, the nave would have to be shortened one bay, or the site lengthened as noted in the former extract from their report.

Messrs. Bodley & Garner propose to put nothing but the cathedral upon the ground, and place the transept on the line of the northern boundary. In the arrangement of the entrance in the position shown they have not sufficiently allowed for the fall of the ground, which in William Brown Street could not well be changed, as shown upon their north elevation. They propose an avenue of trees up to the south porch, but this in a climate like that of Liverpool could hardly be expected to be a success.

As regards structure, the striking feature of their design is the great central lantern, modelled on that at Ely, the work of Alan Walsingham, the result of a failure and its most successful remedy. As regards this the architects say :—

We think that the octagon we propose, with its eight nearly equal arches, would produce an interior effect which has not been obtained, so far as we know, in any cathedral yet erected in the world.

I cannot indeed doubt that it would be very fine; nevertheless it has its disadvantages, the chief being that in order to produce the exact octagon the arches are all of equal width, and the main piers project so far as considerably to limit the clear view of the nave, choir, and transepts. This is a difficulty that might to a great extent be got over, but, as shown on the plan, it is unquestionably a serious blemish to what is otherwise a very fine idea. Considering that no practical advantage is

Messrs. Bodley & Garner.

gained by the equality of the alternate arches, I can see no reason why the vista should not in each case be increased by a widening of at least four feet in each of the main arches, and the gain thereby would in every sense be great. The value of the alternate arches as openings is but small, and they could be so reduced as to give opportunity for the very substantial structural additions necessary for the support of the superstructure of the lantern. I think also as regards the main arcades of the nave and choir that, considering the massiveness of the pillars, greater width might be given to the archways, and the number of bays thereby lessened. As shown upon the drawings, they seem cramped and stilted, and redistribution of solids and voids might, I think, be attended with excellent effect.

There is another point in the plan which requires remark. In the western bay of the nave and aisles there is a flight of steps across the church which would practically shorten the floor of the cathedral to that extent. This, though far from objectionable as regards architectural effect, would be an element of danger to a crowded congregation unless guarded by screens or other kind of barrier, giving warning of the descent, which otherwise might not be noticed.

Irrespective of these points, the structural plan is good, and the means of access, though only about two-thirds of what is provided for by Mr. Brooks, are, I think, fairly sufficient.

The choir is spacious, and the stalls and seats are shown for 106 adults.

The arrangement of the stalls is shown only on the large scale plan, but is quite unobjectionable.

The floor plan provides also for a morning chapel, chapter-house, and vestry for bishop, dean, canons, and choir, but is deficient in respect of lavatories and other conveniences, which are nowhere provided.

In the crypt, which extends only under about one-half of the nave and aisles, provision is made for consistory court, offices, and muniment-rooms; but no special mention is made of a choir school, though ample space is provided for every such requirement.

Owing to the narrowing of the arches of the nave and transepts, the floor space within view of a preacher would be less than that provided by other competitors, but excluding the choir and aisles, there would be convenient room for about 2,500 on the floor, clear of all obstruction, and this, as I have shown, is capable of increase.

As regards architectural character, the great central lantern over the crossing is the principal feature of the design, and this would undoubtedly give a most noble and impressive massiveness to the whole exterior. I cannot, however, but think that if the lantern were crowned by a finely-outlined conical roof, covered with lead, the effect would be grander than that produced by the spire and upper lantern, which are not suitable to the subject, are not necessary, and would detract from the general breadth and power of the whole composition. Even a roof of low pitch would be better than the spire, which seems out of place on such a structure,

The western front, its towers and spires, are not worthy of the subject, and considering the depth and spaciousness of the porches, the approach to them is hardly compatible with the grand character of the structure within. The architects have adopted a somewhat elaborate style of detail, the disadvantage of which in Liverpool was pointed out in the last clause of the instructions to architects. This might be in some measure, but not wholly, modified without inconsistency with the general principles of the design.

The flanks of the cathedral show a noble range of clerestory windows, the effect of which would be undoubtedly beautiful, but would almost demand a large expenditure on painted glass.

Both the transepts and the eastern façade are capable of improvement, and the morning chapel is somewhat insignificant.

As regards the interior, inside as well as out the central lantern is, of course, the principal, and a very noble feature, but the general proportions of structure are good, and the height not excessive; the narrowness of the four main arches and of the arches in the nave arcades in proportion to the piers is, however, very evident when considering the general internal elevation.

As regards acoustic properties, Messrs. Bodley & Garner make no remark, nor do they say anything on the subject of estimate.

As regards materials, they would prefer to use the red sandstone of the district for the interior of the church; but for the exterior "advise Portland, or one of the best hard stones of the North," subject of course to future consideration and investigation, "as to resistance to smoke and weather."

Nothing is said as to the roof coverings.

As regards estimate, although undoubtedly elaboration of details and solidity of structure would in this design enhance the general cost, yet the smaller cubical area, as compared with the much loftier building of Mr. Brooks, would go far to

Messrs. Bodley & Garner.

equalise the estimates, and judging by my own calculations, I see no reason why the expenditure should pass the prescribed limits.

(*To be continued.*)

THE SAXON CHURCH, BRADFORD-ON-AVON.

A PARTY of the Bath Field Club visited, last week, the Saxon church of Bradford-on-Avon, which has been restored under the direction of Mr. Adye, architect. He explained the work to the members. The precincts of the chapel have been cleared from the tumble-down, cumbrous sheds built against the south wall and hiding its features, the roof has been repaired and made watertight, and the walls, which were in a dangerous state and consisted of an outer and inner facing of masonry with the space between hollow, have been filled in with Portland cement, thus binding the whole together in a solid mass. The small round arches have been repaired and completed wherever it was necessary, for structural reasons, to do so, and wherever there was sufficient "springing" left to carry on the design. On clearing away the structure abutting against the south side, the foundations of a south porch were found, and the pitch of a high roof, corresponding with the height of the wall, plainly indicated on the outside, an interesting point, thus showing that the south porch was a facsimile as to height and dimensions of the existing north porch. Two solid buttresses have been carried up, resting upon the base of the east and west walls of this porch, thus marking the site, and acting as a support to the main wall on that side; though in the opinion of the architect such support was not needed. Entering through the arched doorway into the nave, the great height of the chapel at once arrested attention, and when the eye became accustomed to the dim light, the irregularity of the details, the descent instead of ascent into the chapel by a step, the bulging look of the walls, which might have been original, and intended to be out of "plumb line;" the curious "rundlet" or reed-like ornamentation round the chancel arch—the only ornament in the chapel save the two angels high up in the chancel wall—all came out at last into prominence. The chancel appears to have been lit by one deeply-splayed window, high up in the south wall, and the length of the whole building corresponded with the height of the walls, 25 feet. Passing through the north porch, the outside details were inspected, which are equally interesting with those in the interior. The arched panelling, all round under the eaves, evidently cut out of the masonry, the flat pilasters, "stepped" now on one side of the base, now on the other, here and there on both sides, the irregularity of the string courses and the general idiosyncrasy of the structural details were remarkable. The west front has three windows pierced in it, and on the inside beneath them it is stated that they were not found there originally; here, perhaps, utilitarian purposes were a sufficient reason for breaking the otherwise plain western wall face.

EDINBURGH OFFICIALS.

A REPORT has just appeared on the duties and emoluments of the officials employed under the Corporation. The following extracts may be considered to have interest:—

The Superintendent of Works, Mr. R. Morham, is paid 400*l.*, the salary including entire allowances for principal assistants and clerk. He is permitted to take private work; but he states that his official duties now so occupy his attention that he cannot get such business attended to except by working far beyond ordinary office hours. The average salary paid to Mr. Morham for professional work beyond his official salary for the ten years to 1886 is 292*l.*

The City Road Surveyor, Mr. David C. Proudfoot, was appointed in 1879, having previously been Surveyor to the City Road Trust. His salary is 400*l.*, with house valued at 40*l.*, and his assistants cost 712*l.* a year. The outdoor staff of the Road Department costs on an average 138*l.* 17*s.* weekly, or 7,224*l.* per annum.

The Master of Works, Mr. John Russell, appointed in 1880, has a salary of 200*l.* His duties are to examine all plans that come before the Dean of Guild Court, and generally to inspect buildings, &c., as to their stability. The Master of Works says he has all along paid all car and other expenses from his salary connected with his duties. He asks that these may now be allowed to a reasonable amount.

The Burgh Engineer, Mr. Cooper, has a salary of 400*l.* His staff consists of seven ordinary assistants, one assistant surveyor or draughtsman, and one junior assistant, two sanitary engineers or experts, and ten inspectors, some of whom are only temporary. The salaries of the staff range from 175*l.* per annum to 26*s.* per week. The duties of the Burgh Engineer consist chiefly in the preparation for and execution of such of the larger drainage and sewage works as required to be carried out from time to time, and works of general improvement ordered by the Town Council from time to time. He has to attend on committees, to revise the plans before the Dean of Guild Court, attend the weekly meetings of the Court, prepare reports for the Town Council, &c.

Mr. John Paterson, Inspector of Lighting and Cleansing, was appointed in December 1853, at a salary of 200*l.*, with 20*l.* additional for house rent, and 40*l.* for the keep of a horse—equal in all to 260*l.* per annum. In 1859 the salary was raised to 240*l.*, but the allowance for the house-rent was withdrawn; in 1866 the salary was raised to 300*l.*, and the allowance for keep of a horse, &c., was increased to 50*l.*; and in 1872 the salary was raised to 400*l.*, at which it remains. The number of men employed in the different departments is as follows:—In the office, one assistant and one clerk; lighting department, 67 men; cleaning, 171 men; cartage, 115 men; workshop, 14—total, 369.

The assessor under the Lands Valuation Acts, Mr. Paterson, has a salary of 400*l.*, and for the Registration of Voters 150*l.*—total, 550*l.* His duties include the preparation of 140 survey books; a register of proprietors, with an index of all factors and agents; the despatch of 6,950 requisitions to proprietors, agents, and tenants, in connection with which 1,650 letters usually require to be written to parties failing to make their return; a record of returns; an annual survey of every separate subject within the burgh; a comparison of the new and old returns; revised valuation of properties; the issue of 32,000 notices of valuation; receiving and meeting objections and appeals for six weeks; preparing the Valuation Roll, which contains 66,200 entries; making up the register of voters with a separate list of women voters for municipal elections; assessment ledgers, written in wards, for burgh assessments, poor and school rates for six different parishes, land tax, and Government ledgers; polling books; analysis of valuation roll; a supplementary survey; petitions for relief from burgh assessments; and other incidental work, which has been considerably increased by the extension of the municipal boundaries and the Franchise Act. The salary of the assessor's first assistant is 250*l.*; second assistant, 200*l.*; three others from 100*l.* to 105*l.*; four at 95*l.*; four at 80*l.*; and ten at 1*l.* 5*s.* each per week—the salaries of the whole office amounting to 2,655*l.*

The head gardener, Mr. Angus A. M'Leod, was appointed in 1877, at a salary of 260*l.* per annum, which was afterwards increased by 10*l.*, including 30*l.* for house rent. He has on his staff an under gardener at 5*s.* 10*d.* per day, with free house; a propagator and plant grower at 5*s.* per day; other fifteen men as gardeners and park officers at from 2*s.* 4*d.* to 4*s.* 2*d.* per day; a foreman employed at the Meadows and Links at 5*s.* per day; and ten workmen and park officers at 3*s.* to 4*s.* 2*d* per day.

MOSAICS IN CHESTER CATHEDRAL.

THERE has just been completed in Chester Cathedral a series of works in marble mosaic which exceed in importance of aim and extent of area any similar work of modern times. This is the set of mosaics executed by Messrs. Burke & Co., of London, from the designs of Messrs. Clayton & Bell, for the decoration of the north wall of the nave, the cost, which has been very considerable, having been borne by Mrs. Platt, of Durnham Park. In each bay there stands one of the great figures of Old Testament history, Abraham, Moses, David, Elijah, and on either side of these are panel-spaces filled with grouped compositions, which illustrate some leading incidents in the life of the central figure. Thus, Abraham is flanked by pictures of the Sacrifice of Isaac and of the Burial of Sarah; Moses by the Finding of the Cradle in the Nile and by the episode of Aaron and Hur supporting the Lawgiver's hands; David by the scene of David before Saul, and of the King's grief at the news of Absalom's death; and Elijah by the scenes of the Angel appearing to Elijah, and of the Prophet's denunciation of Ahab. Above are canopied niche-like panels containing other Old Testament figures, &c. The special interest of the work consists in the fact that it is in marble mosaic, composed of an infinite number of *tesserulæ*, such as one sees in an old Roman pavement, but such as have very rarely been used in wall decorations either in ancient or modern times. The present age has seen a great revival of the mosaic art, but almost exclusively of the Venetian type, with gorgeous colours and backgrounds of blazing gold. This work is very splendid in its proper place, and, seen from a distance, it is brilliantly decorative. But it may be doubted whether the cool tones of the marble—white, grey, yellow, green, &c.—are not more in harmony with the character of a northern cathedral. The Chester panels are soft and beautiful in tone, and the designs reflect much credit upon the artists. It is impossible to see them without a feeling of deep regret that the late dean, Dr. Howson, to whose careful supervision they owe so much, did not live to see them completed.

NOTES AND COMMENTS.

PROFESSOR KENNEDY, of University College, read a paper at Tuesday's meeting of the Institution of Civil Engineers, upon "Engineering Laboratories." While admitting the necessity of workshop teaching, he said it was incomplete, and that pupils required also to know other things, which could be gained best in an engineering laboratory, in connection with some institution where technical instruction was given. He claimed that, in the matter of engineering laboratories, as a branch of technical education, England had really taken the lead, instead of being, as was too often the case in such matters, in the rear. The principal subjects upon which experiments in an engineering laboratory might be carried out were said to be the following:—(1) Elasticity and the strength of materials. (2) The economy, efficiency, and general working of prime movers, and especially of the steam-engine and boiler. (3) Friction. (4) The accuracy of the apparatus commonly used for experimentation, such as springs, indicators, dynamometers, gauges of various kinds, &c. (5) The discharge over weirs and through orifices, and hydraulic experiments in general. (6) The theory of structures. (7) The form and efficiency of cutting-tools. (8) The efficiency of machines, especially of machine-tools, and of transmission-gearing. (9) The action and efficiency of pumps and valves. (10) The resistance of vessels and of propellers, and experiments in general connected with both.

ONE of the most esteemed of the French painters, M. FRANÇOIS BONVIN, it is feared will become blind, and an appeal is made to his brother artists to co-operate in providing a fund to enable him to live during the remaining years of his life outside a charitable asylum. It may be said that he should have provided for such an emergency, but no one who knows anything of the state of art in France would make that remark. M. BONVIN was always industrious; he considered that every work of his should be finished *ad unguem*, and he never cared to sacrifice his ideal of art to the necessities of the hour. He was willing to be poor so long as he could paint pictures with all the elaboration of the Dutchmen, and it was pain to him to see a work taken from him. M. BONVIN was born among the poor, and it was in the free schools of Paris he received his first lessons in art. The merits of his paintings were not of an obtrusive kind, and dealers and amateurs passed by them in the Salon. Yet he was the recipient of a Salon medal nearly forty years ago. The benevolence of the artists of Paris seems to be inexhaustible, and it is certain that a sale will be shortly held at the Hôtel Drouot of the paintings and medals which they will contribute for the benefit of an artist whose fate has excited general sympathy.

THE Dublin Corporation lately borrowed 100,000*l.* for paving works. It was proposed to use Irish setts, and especially those supplied from Mr. PARNELL's quarries, although the price for them was about 24*s.* a ton, whilst Welsh setts could be had for 4*s.* or 5*s.* less. Tenders were again considered last week for next year's stock. The prices ranged from 21*s.* 6*d.* to 24*s.* 6*d.*, and again the high price was accepted. One of the members of the Town Council said that, according to his calculations, if the 100,000*l.* had been expended on commercial principles, work could be accomplished for which 137,000*l.* will have to be paid. Against that theory, it was argued that the Welsh quarry-owners had lowered their prices in order to overwhelm the infant industry.

THE French sculptors seem to be enduring hard times at present, for scarcely a week passes without a revelation of misery in one form or another. The provinces do not appear to be a better field than Paris. A meeting has been just held in Lille in order to organise a lottery for the benefit of the family of the late ERNEST HIOLLE, who was supposed to be the worthiest representative that Valenciennes gave to sculpture. He was a winner of the Prix de Rome, and received the highest honours in exhibitions; but, after a life of incessant labour, he died lately in a state of poverty, leaving a family of seven young children. Why sculptors should suffer so severely is a question which economists and politicians might well consider. Every one knows that French sculpture is not to be surpassed unless by going back to the ancients. Frenchmen are proud of the art, and yet almost every studio contains models for which no patrons are forthcoming. The exquisite works by M. CARRIER-BELLEUSE, which passed this week through the auction-room, testify that the leading sculptors in France, men whose fame is not confined to their native country, have works lying on hand for years. Any English amateur who cares for French sculpture could hardly find a better time to secure beautiful examples.

ENGLAND is fitly represented in Rome by an ambassador who takes more than an amateur's interest in art and archæology. When Sir SAVILE LUMLEY was in Brussels he described the processes of bronze casting in a manner that would do credit to the superintendent of a foundry. In Rome he not only watches the archæological discoveries that are the results mainly of accidental exploration, but he conducts explorations himself in a systematic way. A few nights since Sir SAVILE LUMLEY described some of the remains which he was fortunate to find on his own ground at Civita Lavinia, and some of which now enrich the Nottingham Museum. The address was given to the members of the Society which represents British and American archæology in Rome. In the course of it the ambassador also spoke of the discoveries which were made in excavating the foundations of the National Bank in Rome, a statue of ANTINOUS being one of the treasures, and of the columns of grey granite lately found in the Via Frattina.

THE election of the Council of the French Society of Water-Colour Painters has taken place. The following appointments were made:—M. BOILVIN, president; M. COURTRY, vice-president; M. HENRI LEFORT, secretary; M. MONGIN, treasurer; M. PENET, archivist.

THE last number of *L'Art* contains the first of a series of papers on the collections of Chantilly, by M. CH. YRIARTE, which will be amply illustrated. In the inventory which the representatives of the Duc D'AUMALE furnished to the Conseil d'Etat, the value of the collections and furniture in the château is stated to be 8,344,000 francs. M. YRIARTE says that the reconstruction of Chantilly has cost six millions of francs, and that the stabling and other outlying buildings are valued at from two to four millions, while the park and grounds are worth twenty-one millions, so that the gift to the French people is worth between thirty and forty millions of francs. M. YRIARTE has no fear of the consequences of suggesting that the gift is a noble return for a decree of exile. He does not hesitate to say that if a representative Frenchman is to be named, the thoughts at once turn to the Duc D'AUMALE. His theory is that the collection is what it is because it was inspired by the thought of one who is essentially a Frenchman, and who felt that in bringing together so many historic heirlooms he was doing something to glorify his country. The number of *L'Art* contains among the illustrations an etching of *Salome*, in which a subject that might be supposed to be exhausted is treated in an original way by M. HENRI DUMONT. The artist imagines that the salver with the Baptist's head was placed on an altar under an idol in a deep recess. SALOME enters, and is scared by the appearance of the head, which is surrounded by a halo and turned towards the dancing girl, who shrinks back. The plate is a compound of mezzotint and etching, and is no less masterly in its chiaro-oscuro than in conception.

THE late M. BALLU tried to persuade M. CABANEL to paint figures that would typify the twelve months of the year for the Salle des Cariatides in the new Hôtel de Ville. In the former building M. CABANEL's figures of the months were greatly admired. But the painter was not eager to compete with the work of his youth, and decoration of another kind had to be found. Fortunately the cartoons of the original figures were not destroyed. They were discovered by M. ARMAND, the architect, and a commission was given at once for engravings of them in the best style. The portfolio will shortly appear. M. CABANEL has increased the interest of the work by designing a figure that will serve for frontispiece.

GRAND THEATRE · BABINGTON LANE · DERB

4th 1886.

ILLUSTRATIONS.

GRAND THEATRE, DERBY.

THIS theatre was originally completed last spring, but was unfortunately burnt to the ground a few weeks after the opening. It has been rebuilt from the original designs by Messrs. BRADNEY & Co., of Wolverhampton, under the direction of Mr. OLIVER ESSEX, A.R.I.B.A., of Birmingham and London, the architect of the former building, and it was reopened to the public last month.

The front block consists of the entrances, staircases, crush-rooms, lavatories, two small shops, &c. The auditorium has two tiers of the customary horse-shoe shape, with the usual accessories in the way of private boxes, refreshment-rooms, lounges, lavatories, &c. From the proscenium to the back of pit is 65 feet, and the width of the pit is 67 feet. The stage is 40 feet in depth by 67 feet in width, the depth below the stage is 23 feet, and the height to the gridiron is 65 feet. There is also a back stage, giving an additional depth of 13 feet by 20 feet in width. There are the usual green-room, dressing-rooms, property-rooms, &c., in connection with the stage.

The whole of the woodwork throughout the building has been coated over twice with the patent liquid cyanite fireproof paint.

DOCTOR'S RESIDENCE, HARROGATE.

THIS house has been built for Mr. HENRY J. HUNT in Victoria Avenue on the Victoria Park Estate, and contains on the ground floor the following accommodation :—Dining-room, 24 feet by 17 feet; morning-room, 20 feet by 16 feet 6 inches; consulting-room, 17 feet 6 inches by 14 feet, with lavatories, watercloset, &c., in connection; hall and principal staircase; kitchen, 17 feet 6 inches by 14 feet 6 inches; scullery, pantry, and butler's pantry. The drawing-room is on the first floor over the morning-room, and has large oriel window and outer balcony. The exterior walls are faced with pitch-faced delph stone from Pateley Bridge in very narrow courses, and the dressings are of local sandstone from the Killinghall quarries.

The contractors for the different trades were—Mr. WILLIAM BERKINSHAW, mason; Mr. R. A. RAWORTH, joiner; Mr. C. FOSTER, plumber; Mr. W. WALKER, plasterer; Mr. J. BAYNES, slater; and Mr. G. DENT, painter. The whole of the works have been carried out under the supervision of Messrs. H. E. & A. BOWN, architects, Harrogate.

HOUSE AT SHORTLANDS.

THIS house is being erected in a prominent position overlooking Shortlands Park. The walling is of red bricks. The roof will be boarded, felted, and covered with Broseley tiles. The barge boarding, balcony, and other outside woodwork is being done in oak. The balcony is designed to overlook the grounds and other very fine views. The architect of the building is Mr. G. WARREN COOPER, M.S.A., of 16 Calthorpe Street, Guilford Street, and at Beckenham, Kent.

THOUGHT COT, BRENTWOOD.

IN this small house, built for Mr. W. NORMAN MARSHALL, Messrs. H. & E. MARTEN have endeavoured to utilise to the best advantage a limited frontage. One spacious room is obtained on the ground floor capable of division by sliding partition; also small kitchen, scullery, and larder. Five bedrooms are obtained on mezzanine, first and second floors, together with bath-room, water-closet, and box-room. A hall with fireplace, and an additional sitting-room over, are now in course of erection. The materials used are red bricks. The roofs are covered with red tiles, which contrast pleasantly with rather more than the usual amount of white paint; the spaces between framing in gables are filled in with dark rough cast in cement.

MONTACUTE HOUSE, SOMERSETSHIRE.

THIS mansion was erected between the years 1580 and 1601, by Sir EDWARD PHILIPS, sergeant-at-arms to Queen ELIZABETH. The cost of its erection is said to have amounted to nearly 20,000*l*. The form of the plan is that of the letter "E," intended, perhaps, by Sir EDWARD as a mark of respect to his royal mistress. The house is built of stone found on the estate, of a rich brown colour, ornamented with gables, a balustrade, pinnacles, and enriched cornices. Between each window of the second storey are niches, occupied by figures in ancient costume; the chimney shafts present columns of the Doric order. On the central compartment are the arms of the family, and over the entrance is the following inscription, dictated by the true spirit of old English hospitality :—"Through this wide-opening gate, none come too early, none return too late." The building, which is 92 feet high, is divided into many and spacious apartments, among which is a magnificent banquet gallery, 189 feet long, and 21 feet wide.

The illustration is from a drawing by Mr. ARTHUR KEEN.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE fourth ordinary meeting of the Institute of Architects was held on Monday evening, Mr. E. I'Anson, president, in the chair.

Mr. MACVICAR ANDERSON, honorary secretary, stated that Mr. Ewan Christian had presented to the Institute a copy of his report on the Liverpool competition.

Mr. W. T. Oldreive, the holder of the Godwin Bursary, he said, had submitted a report of his tour in Germany, consisting of about thirty-eight pages, and the Council had considered it of sufficient merit to award Mr. Oldreive the whole sum of 40*l*.

The Special Travelling Studentship offered for one year by Mr. Aldwinckle was gained by Mr. G. G. Oakeshott, who had made a report of a tour of two months spent in Italy, studying and sketching; Florence, Siena, Bologna, Orvieto, Brescia, Mantua, Cremona, and Genoa having been visited.

Mr. A. B. Mitchell, the winner of the Soane medallion, had been absent twenty-seven weeks, and had sent 215 drawings of particular merit, and the Council had awarded him the second sum of 50*l*. The shading off with Indian ink, Mr. Anderson said, he considered particularly happy.

Mr. M. B. ADAMS spoke in high terms of these drawings, and particularly of Mr. Mitchell's new system.

Mr. WHITE, secretary, said that Mr. Mitchell had learned this system from a Russian student he had met with in Milan.

Mr. R. PHENÉ SPIERS, F.S.A., said Mr. Tschagine, the Russian student alluded to, had studied for two years in Rome and picked up the Fortuny system—that was to say, the method of graduating tones of Indian ink or other colours, laid down by the painter Fortuny.

Mr. R. W. EDIS, F.S.A., said he had seen these drawings, and expressed his wish to offer twenty guineas for one month's work, to be spent in making measured drawings and details of the sixteenth, seventeenth, or eighteenth century work, as opposed to mere sketches of English work.

The PRESIDENT said the nomination of candidates for the gold medal would take place on February 14, and those who wished to submit names for nomination must forward them during the next fourteen days.

Mr. W. BRINDLEY then read a paper entitled—

Marble: Its Uses as suggested by the Past.

Mr. Brindley commenced by reminding his audience that the name marble—from the Greek *Marmio*, to gleam, sparkle—well applied to the Grecian white marbles, which differed materially from those of Carrara. The Greeks, judging from their works *in situ*, cared only for white marble, with occasionally a plinth, step, or back of a sculptured frieze, of black, adding to its whiteness. Their temples in Sicily confirmed this, being coated with *marmoratum*, a white stucco made of pounded white marble and lime putty, and rubbed to a fine marble-like surface, examples of which still existed at Girgenti. The Romans had continued this process at Pompeii. The Greek's quarrying was further proof of his love for white, the grandest quarries extant being those of Pentelicus. The ancient marble-pitched slide for lowering the blocks still existed on Mount Pentelicus, and a small groove for the conveyance of water from quarry to quarry could still be traced. The vein of statuary in the great quarry pitched into the mountain where the Greeks had followed it, producing a huge cave from which they seemed to have obtained their best statuary for sculpture. The *débris* of the floor was now concreted together, the stalagmitic cement being of pure crystalline marble. After a description of the quarry and its marbles, the author mentioned the base rock of the Acropolis of Athens, a solid mass of rich coloured marble, which, although on the spot, had been discarded by the Greeks. The Parthenon and other buildings on the Acropolis were of an ivory-white marble, which, under the blue of an Athenian sky, produced a most

grand and impressive effect. Although white marble only had been used by the Greeks it was not from dislike to colour, but the opposite: to enable them to apply whatever colour they chose. Existing remains proved that they used colour and gold freely, and many of the broad Doric mouldings were, he thought, designed specially to receive colour. Whatever his tools and appliances, the Greek had executed as delicate work as could now be accomplished, while he used the drill far more dexterously than any modern workman. The Romans seemed to have introduced coloured marbles in monumental works after their conquest of Egypt, whence they derived the first ideas of monolith columns. The Romans imported from every corner of their vast empire the grandest and choicest materials for temples and palaces, an example we, as a nation, might well follow. The early buildings of Rome contained few varieties of coloured marbles, the number increasing as the colonies matured. The monoliths in St. Peter's and San Sebastien were cut from the quarry of Porta Santa, and also the immense basin discovered by Mr. Wood at Ephesus. In the ancient quarry in Tunis, which supplied the *giallo antico* and varieties of rose and orange *breccias*, the Romans had cut a large portion of the mountain away, and one could distinctly see whence they had cut their monolith columns, and hewn them roughly into shape whilst attached to the rock. These quarries had been specially protected by a massive wall, remains of which still existed, together with ruins of the adjoining Roman city, but *no* marble was used in their construction, it being reserved for Rome, where 172 columns of it were still extant. The pavement in the Basilica Julia was mostly composed of it, and also the columns in St. John Lateran, the Pantheon, and the Arch of Titus. Most of the coloured marbles in Italy had, no doubt, been quarried during the time of the Cæsars. The ancient quarries of Egyptian or purple porphyry had not yet been found, for the statements of modern writers as to their locality were incorrect, Syenite granite being mistaken by most of them for the more valuable material. Nothing could approach the purple porphyry in colour, firmness of grain, or durability, and columns wrought 1,900 years ago still retained their freshness of colour. It had been obtainable in very large sizes, only exceeded by the granites of Egypt and the green *Cipollino* of Carystus, which latter was much appreciated by the Romans, for in Rome alone 500 columns still remained; and good Cipollino was now again obtainable. The Romans, who had learnt it from the Greeks, retained the employment of marble and the methods of working it just the same until the time of Justinian. When Constantine was converted, the Pagan temples which could not be adapted to the Christian religion had been allowed to decay, and then seemed to become the quarries to supply materials for churches for nearly 1,000 years. In the great sea-wall of Constantinople, where it was partly broken down by the sea, columns used for bond could be seen, as well as the upper beds of carved capitals and the lower portions of moulded bases; the carving of the capitals being as beautiful as they were various in design. The Byzantine interiors exhibited most charming examples of marble decoration, and it was instructive to note the small quantity of marble used, it being a thin, yet durable, applied decoration, showing no desire to appear anything different. Several smaller churches in Constantinople, like St. Sophia, showed skill in surface decoration, the walls being covered with oblong panels in tiers of rich marble, framed with narrow white mouldings and bands of a different colour, continuous lines of colour on white being introduced between these panels, while the whole was surmounted by a marble mosaic frieze, with a cornice carved with small sharp triangular shadows. This system applied to St. Mark's, Venice, but at Palermo the marble panels were more elaborately framed with bands of very choice mosaics. The marble balustrade round the gallery at St. Mark's had probably been copied from St. Sophia. At St. Mark's any early carved stone found had been walled in so as to be seen. The marble pavements of Greek temples were probably the earliest, and were usually thick slabs, white, and of large dimensions. The Greeks also perfected the tesselated mosaic pavements; from them the Romans had gained their knowledge, brought to Rome many of the beautiful pavements found in Greece, and, becoming proficient themselves in the art, used it throughout their empire, even in Britain; but here, at their departure, it had fallen into disuse until a few years ago. We had to thank French architects for the revival of this art, but modern pavements, owing to cheapness, were very inferior to the ancient; an old tessera could be chopped into three modern ones. Good concrete foundations were necessary for the success of these pavements. Some of the grandest pavements were the simplest, as those of the Basilica Julia at Rome, St. Sophia, and one under the dome of St. Mark's. The author differed entirely from those who thought St. Mark's pavement was always undulating or bent as at present; these slabs being sawn from a single block, the waste of working them crookedly would have prevented the markings opening out into one connected pattern; if this pavement were ever repaired, he thought the broken slabs would be found level underneath, and if reversed would produce an even surface. After describing the pavement in the Basilica Julia, the author proceeded with an account of the mosaic pavements of *opus Alexandrinum*, so various and plentiful in Italy, and of which we had a good example in Westminster Abbey. They were usually composed of but few colours, red and green porphyries with white palambino for the mosaics. These pavements had always been made out of old materials, and the variety of geometrical design was truly amazing, some of the most beautiful being in Palermo. The white palambino was a limestone of pot-like texture. The great pavement of Sienna Cathedral, one of the finest Italian Renaissance works, consisted of pictorial subjects in dark-green marble and mastic inserted into thick slabs of white marble. Marble pavements in squares of black and white, introduced about the time of Torregiano, had been largely used, as at King's College Chapel, Cambridge, the Beauchamp Chapel, Warwick, and in domestic work generally; the white tiles came from Italy and the black from Belgium. With the Dutch and Belgians these pavements had never fallen into disuse, and the demand was still great for them. Our mediæval builders had used coloured marbles very freely in church architecture, the retiring grey Purbeck, Petworth, or Frosterley being used; and their work taught the value of greys, their colouring—in arcading, for instance—giving distance, but with quiet dignity, holding its own, as something of extra value. The most satisfactory of the altars and monuments of the Italian Renaissance were executed in white marble, with only one colour introduced for the columns, pilasters, frieze, pediments, and the panels of base. Polished marbles and stone rarely went well together in the same work, but some marbles—greys, reds, and Cipollinos—looked very well dull-polished, and in that state would go better with stone. English alabaster was an excellent economical material to work with marble, and though only used for interior work would, if carefully selected, and used where wet would not run over it, be found better than many stones, and keep its colour. It had been used for monumental work from a very early period, and the most delicate work had been executed in it. About the fourteenth century it came into general use in Derbyshire, and during the Elizabethan period was the material most used for important monuments. Memorial slabs of incised marble had preceded brasses, and were far superior to them. The English Renaissance, culminating in the "Adam style," had left us marble work in chimney-pieces equal if not superior to anything on the Continent, the designs being good and suitable to the marble, which was usually of the best quality. The onyx marbles of Algeria, Mexico, and California—of the same nature as Oriental alabaster—could be cut and ground thin enough for window purposes. At Tarragona Cathedral there were some good examples in orange-yellow Oriental alabaster, and also at Orvieto; almost any marble with crystalline statuary ground an inch thick, placed on the sunny side of a church in Italy, would admit enough light for worship, but would not do in England with its variable climate. Great Britain and Ireland contained many varieties of well-known coloured marbles, but they were little used in comparison with foreign marbles, on account of the bad quarrying and high railway rates. If consistent detail were used, Carrara marble might be employed for public buildings. A marble to stand exposure to the weather should be close, hard, and vitreous looking, plenty of which could be selected. The mouldings used in the palaces of the Cæsars and other important buildings in Rome were usually very simple, and looked well in marble, costing less than many modern ones which were designed forgetful of masons' method of work. Mouldings also needed to be drawn specially to suit the colour. Marble linings, when possible, should be fixed hollow at the back, and a few small places left open in the joints until the solid walls were dry, the hollow allowing the slab to keep a little warmer than the wall, thus avoiding condensation. In the British Museum, the South Kensington Museum, and other similar collections, were some fine examples of ancient coloured marbles, but they were seldom distinguished by names, and when they were, the names were generally incorrect. In the University Museum at Oxford was one of the finest collections of specimens known, but they had been for years in a dark corridor where it was next to impossible to see their colours. In France, coloured marbles were appreciated as objects of beauty, the same as fragments of sculpture, the collection in the Museum of the Louvre being, in the author's opinion, the most instructive known. Mr. Brindley concluded by referring to the useful arrangements of the Museum of the French School of Mines, where the wall space was divided to represent each geographical department, thus enabling one to see at a glance everything geological in each Département likely to be of use, viz., its earths, sands, clays, limes, stones, marbles, and granites.

A letter was read from Dr. Freshfield, who regretted being unable to attend, and referring to a photograph he sent, which would be explanatory of others previously sent.

Mr. ALFRED WATERHOUSE, R.A., said that as he had been instrumental in getting Mr. Brindley to read the paper, he should like to express the pleasure he had had in listening to

it, and also to propose that their best thanks should be given to Mr. Brindley for the immense pains he had taken in preparing so instructive a paper, and for illustrating it in so profuse a manner. He congratulated him also on the beauty of his sketches of the quarries, quite a new class of views, and one of peculiar interest to architects. A point of interest mentioned was the flatness of the mouldings in Roman and other ancient buildings, particularly the one shown, which was cut out of so thin a slab of marble.

Mr. GEORGE AITCHISON, A.R.A., seconded the vote of thanks. Mr. Brindley, he said, had got some of the rarest specimens of marbles to be found in Europe. Some specimens he had seen at his works could not, he thought, be seen anywhere else except in the churches of Rome and the East. He had so condensed the subject that it would be difficult to enlarge on it, and he wished more than one lecture had been made out of it. The instances he gave of the use of marble by the Greeks, Romans, and Byzantines would be extremely useful to English architects who were able to use marble. Unfortunately it did not find favour with the English public, though it afforded one of the most beautiful means of decorating or applying colour to interiors of English buildings. Exteriorly there was the danger of corrosion, and it became so covered with dirt, soot, &c., that the finest marbles might be mistaken for common stone, and thus its use for exteriors could not be commended. Mr. Aitchison then said the subject was one that he could speak on for hours, and would therefore conclude with alluding to the beautiful yellow marble used by the Emperor Domitian to line his palace, a marble which took such a splendid polish that it became quite a mirror.

Mr. BURKE said, in regard of mosaic work, that the cost of a large area was increased by the multiplicity of tesseræ laid, and everything here was sacrificed to the question of economy. The use of marble in this climate had been spoken of, and Mr. Aitchison said that it would corrode in the climate here. It was the same in France. The fault was, however, that we did not keep marble clean. If the soot and gaseous products were removed no deleterious action would be set up.

Mr. WOODWARD said he hoped that after what they had read in the *Times*, and after what Mr. Brindley had said, they would hear no more of the sensational waving in the pavement of St. Mark's, Venice.

Mr. BLASHILL hoped the opportunity would be taken of making themselves, especially the younger architects, acquainted with this beautiful material. He could not understand the English reluctance to using marble when its use was so common, not only in Italy but nearer home, in Holland, Belgium, &c.

Mr. J. P. SEDDON, on the question of cleansing marble, said more damage had been done by washing it than by leaving it alone. He knew cases where it had been cleaned out of existence. He thought the English objection was to the coldness of marble, which the polish in some respects added to. He himself was making use of the warm Devonshire marbles for his churches.

Mr. SPIERS said marble would not suffer unless moisture penetrated it, and that soot was rather a preservative. He did not think they should let it go forth that washing was a preservative, for he thought it had the contrary effect.

Mr. RALPH NEVILL, F.S.A., said in countries where marble was most used the climate was hot. Nothing would be more unpleasant here than the cold marble surfaces. To enter the reproduction of the Corsini Chapel at Gatton Hall was like going into a tomb. Marble, he thought, would be used where great cleanliness was required, and where thoroughly efficient heating could be employed; but for domestic work to any extent the fatal objection he had alluded to existed.

Mr. M. B. ADAMS said that in Ireland, though desirous to use the native marble, the carriage was too expensive. The Belgian marble was cheaper.

Mr. R. W. EDIS, F.S.A., said he differed from Mr. Nevill. He had used marble considerably in various houses, finding it neither cold nor unpleasant. Criticism was freely passed on other parts of his buildings, but no one said a word against the marble. With proper marble masons, he found marble as cheap to use as tile work.

Mr. Heathman, Mr. Hansard, and Mr. Woodthorpe also made some remarks; after which the President put the vote of thanks to the meeting, and it was carried unanimously.

Mr. BRINDLEY replied, and in the course of his remarks said that the so-called jasper columns of the Grosvenor Gallery, which had been spoken of as deteriorating, were not jasper at all. He also referred to a most injurious act of the Metropolitan Board of Works in using muriatic acid to clean the Shakespeare statue in Leicester Square.

The Southampton Town Council have appointed a special committee to report on the best means of celebrating the jubilee year. Among others a suggestion has been made to uild a town hall.

THE FITZWILLIAM MUSEUM, CAMBRIDGE.

THE Director of the Fitzwilliam Museum (Dr. Waldstein) announces that among the new acquisitions to the Museum the following are now exhibited in the galleries and library :—

Picture Galleries.—In the North Gallery the oil painting of *St. Sebastian* attributed to Lorenzo di Credi, presented to the University by Dr. Ford, executor to the late Dr. Munro, of Trinity College, as well as the oil painting of a lioness by James Ward, R.A., presented by Mr. R. E. Lofft, and a portrait by B. Van der Helst, bequeathed by the late Dr. Thompson, Master of Trinity, have all been hung on one side of the south wall.

On the other side of the wall in the same gallery five water-colour drawings by Prout and David Cox, presented some time ago by the late Mr. A. A. Vansittart, M.A., of Trinity College, but not until now exhibited, have been hung covered by curtains which can be removed by visitors desiring to examine them.

In the centre of the same gallery the first series of Braun's permanent photographs of the pictures in the gallery of the Hermitage of St. Petersburg has been replaced by a second series.

The drawings and sketches by James Ward, R.A., in the exhibition stands in the North and South Dome Galleries, are replaced by selections from Albrecht Dürer's engravings on copper, special attention being drawn to the proof of the *Adam and Eve* recently purchased from Lord Chichester, one of the finest proofs in existence.

It is proposed to deposit temporarily in one of the galleries the portrait of the late Professor H. Fawcett, by Mr. Hubert Herkomer, A.R.A., which will be exhibited immediately upon its arrival.

Library.—A collection of water-colour, pencil, and pen-and-ink drawings and sketches by the late Richard Doyle, as well as a manuscript of Byron's "Corsair," illustrated by the artist before his sixteenth year, together with four pen-and-ink drawings by the late Randolph Caldecott, all recent purchases, may be seen in the library upon application to the assistant in charge.

ORNAMENTAL ART.

THE subject of the third lecture delivered at the Yorkshire College by Mr. Lewis F. Day was "The Fitness of Ornamental Form." He said one could scarcely conceive of ornament which was not in a manner more or less modified by considerations altogether apart from the natural forms on which it might have been founded. Even the human form, which is our highest type, and with which less liberty may be taken than with any other of nature's works, is not ready-made to the hand of the sculptor, and the works of the great masters to which we accord the title of "monumental" are so in virtue of a something which was not in the model of the sculptor but in his art. The very position and purpose of ornament, the method of its execution, and even its construction, insisted upon some treatment of natural forms. The mere repetition, which was inevitable, would of itself render such treatment necessary, and even without the inducement of economy we should still resort to repetition if only because the human brain could not go on inventing without intermission, but needed the comparative rest of repeating itself even in hand work. The only question was where and to what extent they should avail themselves of it? In proportion to the naturalism of a design, and the point of realism to which it was carried, it became unsuited to multiplication. To put it the other way about, the oftener it was proposed to repeat a form the more imperative it was that it should be removed from the imitation of nature. It needed, in short, adaptation to the purpose of repetition, and it was adapted only in proportion to what he might call its reticence. A highly elaborate and attractive feature, anything that is in the least self-assertive, would not bear so much as reduplication, whereas any insignificant device might be multiplied *ad infinitum*. The presumable reason for introducing figures into ornamental design was for the sake of some added interest or suggestion there might be in them. But they could not get up any absorbing interest in a series of figures all identically of one pattern. They suggested only the mechanical means employed in producing them. The multiplication of the figure, far from multiplying its interest, diminished it in exact proportion to the number of times it was repeated. The only safety was in toning down the repeated form until its recurrence ceased to be very obvious. This might be effected in various ways. In certain leather, paper, and such like designs, it was brought about partly by the low relief of the stamping, partly by the softness of the colouring, and partly by a more or less cunning complication of the cupids (or whatever they might be) with the rest of the design, so that they did not thrust themselves into notice. The consideration which occurred in such a case was whether it was then worth doing? Useful as an outline was in decoration, it was not

inevitable. Nor was it so easy to say just where the outline should be used. In very many cases the material and its workmanlike employment necessitated an outline, and even determined its colour. It was seldom, however, that an artist would resort of his own free will to an even and rigid outline all round every form. Excepting at a great distance from the eye, where its mechanical equality was not seen, that was almost certain to result in hardness, a defect which was very commonly looked upon as a merit of execution. Mechanical precision was too often the manufacturer's ideal of finish. It was one, unfortunately, which he could all too easily realise, at a cost of what beauty of feeling and colour he could probably never be brought to know. The instinct of art was rather to lose an outline, more or less, in places; and only to insist upon it where its value was sufficient to justify the risk its use entailed. The only rule which could be laid down as to the use of outline was so extremely simple as not to satisfy the doctrinaire. If the need of an outline was urgent, then adopt it; but if no such want was felt, why insist upon its use? The insistence upon outline for the sake of outline, as though decoration was not decoration without this official stamp of pedantry—this trade-mark of the decorating shop—was pure nonsense. Outline was frequently a matter of trade expediency, and no more; and a very wise and fit expedient it was if only in view of that process of reproduction which was one of the necessities of modern decoration, and particularly of modern ornament. The vaguer forms, which depended so much upon the touch and feeling of the artist, did not lend themselves to this necessity. Now, an outline did; and if in outlining his drawing the designer could not help in some degree hardening it, the evil was infinitely less than if the more undefined and delicate forms had been left to the tender mercies of another. Decorative art was a kind of short-hand. Its very existence seemed to depend upon its being done with readiness, quickness, and certainty. That which asked for careful scrutiny to be appreciated would for the most part fail to win appreciation. It might have all manner of merits; but if it hid them, it had no right to complain that men passed them by. Poetry itself that was over subtle was not popular, and decorative art was essentially popular art.

The subject chosen for the final address was "The Study of Design." He said he would have a student of design well grounded to begin with in practical geometry. He would set him to work somewhat on the kindergarten principle, making up geometric patterns. As he grew beyond this, he would let him draw freer and more flowing forms, until he could produce with the brush ornaments such as the Greek pot-painters drew on their vases. Simultaneously with this he might be making intelligent studies of leaves, flowers, and the growth of plants, as well as of the best examples of applied design. His studies should be studies, not pictures. Show drawings were so much waste of energy that might be much better employed. Ornament once mastered, he might pass on, if so inclined, to the study of animal form, and even the human figure. A pupil should never be allowed to make a design without having a distinct idea as to how it was to be carried out. He should be taught to understand that design was one continual solving of problems, a series of perpetual adjustments of the claims of art and of necessity. In all designs for reproduction there should be the utmost simplicity and directness of execution; nothing should be slurred over; every line should be clear and firm. The decorator should readily accept the conditions to which his design was subject, not only adapting himself to them, but taking to them kindly. Training in practical work could not begin too soon. It might sound feasible enough that one should first learn the theory of design and then be taught to apply what he had learnt. But the aim of education was not to cram so much theory into the student which he might make use of in his craft. The most profitable lesson we learnt at school was how to learn. And so he would teach the student how to study and design, and the better way of doing that would be to take him to the workshop and show him what there was to learn there and what to avoid. It was far better to take the sturdy workshop faculty and cultivate that than to rear a kind of exotic or over-cultivated art upon which the atmosphere of the workshop acted only as a chill. It was the fashion to declare that the basis of all art was figure-drawing, that the best preparation for a design of ornament was to acquire a knowledge of human form and a facility of representing it. History and experience went to prove that this assumption was unfounded. The great painters who tried their hand at ornament mostly failed. He did not mean to say that the study of the figure might not be valuable to the designer. What he doubted was whether his time might not be employed to better purpose. As far as the supplementary studies were concerned, he fancied that of the sciences botany would be to more purpose than anatomy, and of the arts flower-painting more to the purpose than figure-painting. The familiar argument was that the study of figure was necessary, because in it the student must be exact. They might take liberties, it was said, with plant form and the like, and no one would be any the wiser, the proportions being more or less variable. It was partly for that reason that the study of vegetable rather than animal anatomy recommended itself to the ornamental designer. He could not accustom himself too soon to accept natural form as something not to be copied, but to be turned to ornamental account, to be used inasmuch as it lent itself to ornament, and in the manner most conformable to ornament, or to be rejected if it would not so accommodate itself. And just in so far as the human form would not permit of modification and adaptation was it unfit for use in ornament. Granted that the habit of working from the human model developed more than anything the faculty of exact and accurate reproduction of nature. But that was not the faculty which needed most encouragement in the designer. On the contrary, the habit of adhering rigorously to natural fact was a positive hindrance to design. It was of infinitely more importance in ornament that the opposite habit of adapting and modifying always should be encouraged. The designer must first think of a design. And, indeed, it was better that he should not even refer too much to actual studies from nature. Their thoughts must be concentrated always upon the lines and masses of their ornament. The consideration of natural proportions only hampered the free development of design. Something like exact study from nature might be necessary, but even plant form was not such a lawless thing as figure-painters might think. The proportions of the parts of plants varied happily, but the construction of vegetable forms were scarcely less scientifically certain than the order of bones and muscles. He did not mean that figure-drawing was superfluous; in some branches of design it was perhaps indispensable, and it was useful in many others; but it was a supplementary or subsidiary branch of training in ornament, and certainly not the basis of it all. On the other hand, there were limits to merely technical teaching. In France a designer of textile fabrics had to go through an elaborate course of technical instruction. He had to master the technique of weaving and to know how every shade of colour in his design could be produced in threads. It was more than doubtful whether quite so much as this was necessary or desirable at all. The designer of textiles did well to analyse the best examples of weaving; only by such means could he quite fully realise what might be done without waste of labour and material. But that he should be a practical weaver, or even an expert in putting the pattern on to ruled paper did not seem to him of the least use in the world. The problem we had to solve was how to infuse into modern manufacture something in the nature of artistic interest. The choice is no longer open to us whether we will divide our labour or not, and he did not think it was at all worth while that the designer should spend a very large proportion of his time in the mere mechanical part of pattern draughting. It was quite enough for the designer to make himself master of what could be done in weaving without knowing exactly thread for thread how it was done. There should be co-operation of the various skilled workers employed. The weaver should explain to the designer the conditions under which he must work, and he in turn should explain to the weaver the effect he wanted to produce, leaving something to him in the way of texture at least, and the method of producing it. A design need not be draughted by the artist; but it must be draughtable. It must be quite clear how many tints were meant to be employed, and where one ended and the next began. There must be no vagueness; there must be no feeling and fudging up to an effect. Every shade and every line must be clear, precise, and workmanlike. The designer who would do anything worth doing must be very much in earnest.

THE UNITED STATES CUSTOMS AND WORKS OF ART.

THE following correspondence has lately appeared in the American papers:—

"New York: October 29, 1886.

"Sir,—I beg to say that I have just bought in Europe some 'old masters,' with the intent of making a collection. The opinion of the department formerly as to what constitutes 'modern work' seemed to differ much from the view current in other countries.

"In my estimation, and according to artists' testimony universally, pictures painted 200 years ago and prior to that are called old masters. It is only those painted within 150 years at most which are termed the 'modern school.' This classification is accepted by all the nations of Europe.

"The old masters form a very important part of the art education of this as well as other countries, and every encouragement should be given for their introduction. These works in foreign galleries are the ones which draw our students abroad to study art, and had we a sufficient number here there would be no temptation for students to go abroad, and a great saving of money would accrue to our country.

"Scarcely any old pictures have been brought to this country since the raising of the duty on paintings. Many are left abroad

to await the day when ignorance and injustice shall be dispelled. At present the discrimination against foreign painters is unjust and much to our discredit.

"I beg to state that I have two cases now entered by me as antiquities, being antique pictures or 'old masters,' and not coming in the least under the name of modern works. They are in two cases, marked C. S., 1126, 1127, per *La Bretagne*. I have entered them as antiquities, being a collection of antique pictures, because Heyl's 'Digest of the Statute' comprises under the free list 'all other collections of antiquities.' Three of the pictures, Ruysdael, Netscher, and Hoogstraaten, are fully 250 years old, and one, Van Eyck, is 450 years old. I have left in London, awaiting the decision of the department, a Masaccio, who died in 1443; an L. Van Leyden, who died in 1533; a Rubens, who died in 1640; and a Vandyke, who died in 1641—the last two pictures being fully 250 years old, the Leyden 350, and the Masaccio more than 450 years old.

"It seems that an intelligent and liberal rendering of the law should be had, as it could not have been the intent of anybody to shut out objects which are not of any commercial benefit to the country as importations, while as works of historical and educational character they are invaluable, and the more we have of them the more the country will be enriched in many ways. I look confidently to your liberal decision in the matter, and remain,

"Your obedient servant,

"HENRY G. MARQUAND.

"The Hon. Daniel Manning, Secretary, &c."

The answer of Mr. Fairchild, Assistant-Secretary of State, is as follows:—

"In reply to your letter of the 29th ult. in relation to the free entry of certain paintings executed in the fifteenth, sixteenth, and seventeenth centuries, and imported by you per *La Bretagne*, I have to inform you that the collector and appraiser at New York report that paintings executed prior to the eighteenth century will be classified as 'antiquities' under the department decisions of June 7, 1882 (not published), April 3, 1885, October 23, 1885, and August 18, 1886. In view of these reports no special instructions as to the paintings in question appear to be required."

The letter of the Under Secretary is taken as an authoritative statement of the principle that is to be observed in future. It was necessary that such a decision should be given, for, as Mr. Marquand points out in a subsequent letter, the precedents quoted have been systematically ignored, and the full duty charged.

TIMBER BUILDINGS IN CHESHIRE.

AT the last meeting of the Chester Archæological and Historic Society, Mr. Alfred Rimmer read a paper on "The Black and White Half-Timber Architecture of England, with a special reference to Chester and its Neighbourhood." Drawings by Mr. John Douglas, Mr. Hodkinson, and other architects had been lent for the occasion. In the course of his paper Mr. Rimmer said that the Early English lasted from 1100 to 1200 roughly speaking, and the domestic largely corresponded with the ecclesiastical architecture of the times. At that period there was very little black and white architecture going, but there was a great deal of wooden architecture. The houses of the peasants were built of solid oak logs, not unlike the log huts built by settlers in the wilds of North America. The feudal nobles, on the other hand, lived separately from the people in their great castles, with their retainers who were their descendants and relations about them. One baron who came to an untimely end at Shrewsbury was said to have had 2,000 of his relatives about him. The Earl of Warwick had even more. They lived quite apart and did not mix with the people at large. The common use of timber in building at that period was attributed for one reason to this, that the country was then densely wooded in many parts. There was an old saying—

From Birkenhead to Hilbre,
The squirrel can go from tree to tree.

And nowadays the squirrel would have a difficulty in finding a tree to go upon. Delamere Forest would no doubt then extend over a large part of Cheshire, and favour the survival of the wild cat in this part of the country, to whose lynx-like grin he attributed the old saying—"he grins like a Cheshire cat." The timber houses in Cheshire were strongly timbered; in fact, one beam in a Cheshire house he had seen at Baddiley would have been sufficient to timber a moderate sized dwelling-house in any other part of the kingdom. In Elizabeth's time there were some magnificent timbered houses in Cheshire and England generally, as well as other houses erected in the Elizabethan style. This style was brought from the Continent in the earlier days of the "Grand Tour." It was, however, the Renaissance style which came in with the architects Vanbrugh and Adam, which was really responsible for the destruction of our timbered houses. Examples of this Renaissance style were seen in the earlier Eaton Hall, Blenheim, Bank Hall, Warrington, and Hooton Hall. He compared the English black and white structures with those of the Continent very much to the advantage of our own, which were of much more solid construction, and alluded to numerous fine examples of timbered work, such as Stokesay, the earliest example extant, the old Town Hall at Hereford, Poulton Old Hall, &c. The Falcon Cocoa-house he described as a beautiful example, dating from Henry VIII.'s time. In conclusion, he recommended for the purposes of timbering the black walnut of America, a wood which deserved to be better known in this country. By getting it ready cut and morticed from the United States they would be able to erect timbered houses very cheaply, and perhaps see a revival of this beautiful, irregular, and picturesque style in England.

Correspondence

Colour in External Architectural Construction.

SIR,—This subject having been made somewhat prominent lately, a brief notice of actual examples may be acceptable to those who may agree with the writer that no architecture can be perfect without the aid of colour.

Two principles are observable. The first, and best, where coloured materials formed part of the substance of the walls; the second, where marble veneers and mosaics and tiles were attached to the surface of the walls. The examples in this country and the north of Europe belong to the first class. Among them are the churches of Strixton, Northampton (St. Peter's), and Irchester. In these the walls are decorated with alternate bands of red and white stone. In Kent alternate courses of stone and flints are common. In Norfolk, Essex, and Suffolk flat tracery and other patterns are cut out of stone, and the spaces filled in with flints of small size. At Westminster Abbey there is groining of light stone, with the cells filled in with stripes of dark and light stone of equal width; and throughout the thirteenth century the use of polished marble columns was a marked feature in most buildings.

In France the examples of constructional colour are very numerous. At Vezelay the noble Romanesque church is banded without and within with dark and light stones. At Clermont Ferrand the windows have voussoirs of alternate dark and light stone, with a mosaic diaper above. Between the bold corbels of the cornice are stars, chevrons, &c., in various colours. A splendid frieze, of geometrical pattern, surrounds the apse. The architects were evidently well pleased to take advantage of the variety of coloured materials which the volcanic district afforded. Eight centuries of exposure prove their durability. At Cologne, at Lubeck, the same mode of building may be seen.

It is in Italy, however, that the use of coloured materials in external architecture was most common—indeed, it may be said to have been universal, and there appears to have been no hesitation in destroying classical remains to obtain rich marbles for this purpose. But quarries of the richest materials abound—breccias, serpentines, jaspers, and rosso, verde, giallo, porfido-nero, and white marbles. At Bergamo, the church of St. M. Maggiore is constructed with grey, white, and red marbles. The architectural effect depends entirely upon the counter-changing of the three primary colours. The groining of the porch is of black, red, and white marble in equal bands. The columns are of red marble. In general treatment the upper part of the porch is entirely grey, the lower red, relieved with black and white, which time has converted into yellow. At Aquila, Pepoli, and Salmona the churches and other buildings have quite an Eastern character, the plain parts of these walls being built in diaper patterns of two or more colours—generally red, yellow, and black. At Venice, Sansovino's exquisite loggia at the foot of the great campanile was not considered complete, though liberally adorned with mouldings, carvings, and statues, without the additional charm of colour. Thus the columns are of Greek breccia, the pedestals and cornices of the *rosso* of Verona, and the remainder of Carrara marble. The Scuola di San Marco, the Palazzo Dario, and the church of Sta. Maria de' Miracoli are richly encrusted with coloured marbles. The last is considered a perfect gem of the best Renaissance time. The basilica of St. Mark illustrates both the principles of application mentioned above.

These brief notes would be very imperfect without some reference to Giotto's campanile at Florence. Quatremère de Quincy says:—"Its chief beauty consists in the casing from top to bottom of compartments in marble—black, red, and white." The black is really a green serpentine.

Mr. Quilter says of it:—"From my window, *au troisième*, . . . one building alone refuses to succumb to the influences of

cloud and rain, refuses to be deprived of its colours; its delicate traceries, and its shades of red, yellow, black, white, and green marble still standing out clear and perceptible through the heavy atmosphere. . . . In the course of many years travel in every quarter of the globe I have come upon but one building which had at all the same sort of power over the imagination . . . that structure was the Taj at Agra."

Mr. Ruskin says:—"The tower of Giotto is the loveliest of those raised on earth. . . . Of living work there is none so perfect."

Yours obediently,

H. T.

CHURCH BUILDING AND RESTORATION.

Carlisle.—Work in connection with remodelling the whole of the interior of Warwick Road church has been commenced this week from plans prepared by Mr. T. Taylor Scott, architect, of Carlisle. Among the works the old plastered ceilings and interior shell of the large span roof will be removed, and temporarily supported during the erection of a new stained and varnished roof on the clerestory principle, with two arcades of stained glass lights. A complete system of ventilation will be carried out, as well as new seating for the gallery and ground floor of the church. The contract has been let to Mr. William Latimer, joiner, Sheffield Street, Carlisle, with sub-contractors for the various trades.

NEW BUILDINGS.

Hawick Municipal Buildings.—The new buildings for the police and municipal departments, which were commenced about two years ago, will soon be completed. They stand on the site of the old town hall. Mr. J. C. Walker, the architect, selected the Scottish baronial style as best suited to the peculiarities of the situation. The following accommodation is provided:—Burgh surveyor's rooms, council chamber and committee-room, town hall (seated for a thousand persons), public library and reading-room, police court, police offices and cells (ten in number), an apartment for fire hose and reels, and a keeper's house. Most of the work was executed by local contractors. The total cost will be about 11,000*l.*

SCHOOL BUILDINGS.

Bradford.—The Board schools at Great Horton have been opened by Sir Henry Holland, M.P. The buildings, which consist of three blocks—the mixed school, the infants' school, and the caretaker's house—are designed in the Queen Anne style. The infants' and mixed schools have gables to the front, and carved pediments and terminals at the angles. Below the pediments are panels, lettered with names of the schools and the date of erection. Separate playgrounds are provided for girls, infants, and boys respectively, and three covered playsheds of ample dimensions have also been constructed. The out-offices are fitted with Wilcock's patent automatic closets. Ample cellaring is also provided for heating apparatus and for storage purposes. The mixed school consists of a large assembly hall, 88 feet by 45 feet, well lighted at both ends and at the sides, above the roofs of the adjoining classrooms. The height to the ceiling is 29 feet. The roof is of open timber-work, and the ceiling is panelled in wood moulds in a simple manner. Around the assembly-hall are grouped twelve classrooms, about 25 feet square, and capable of accommodating from fifty-six to sixty-four children each. Each classroom has glass partitions from the assembly-hall, and all are arranged so as to have left-hand light. Two entrances are provided, 9 feet wide, for boys and girls respectively, and cloak-rooms, 30 feet by 24 feet, and 24 feet by 20 feet, are provided for children of each sex. Exits are also arranged for those of each sex to playgrounds 7 feet wide. There are also three teachers' rooms, with private lavatory accommodation to each. Great care has been taken to obtain ample light and simplicity of arrangement, and to avoid dark corners. The infants' school has an assembly-hall similar to the mixed school, but 53 feet by 36 feet, and 26 feet high. Five classrooms are arranged around it, with glass partitions, as in the mixed school, the classrooms being 23 feet by 21 feet. Some of these rooms are arranged for desks, whilst others have galleries. Special provision is made in the galleries in the shape of back-rests and comfortable desks. There are two entrances, two cloak-rooms, and two teachers' rooms to this department, all well lighted. The heating is by means of hot-water pipes round the classrooms and coils in the assembly-halls. Ventilation is provided by inlets into the assembly-hall in the dado framing, and to the classrooms by Ellison's radiating bricks. The outlets are provided by means of Hill & Hey's ventilators in the roofs—one to each classroom—and larger ones to the assembly-halls. The windows of the classrooms are also hung to open. The architects are Messrs. Morley & Woodhouse, of Bradford and Bolton (who were appointed after competition).

GENERAL.

The Manchester Art Gallery was opened on Sunday last free of charge. The visitors numbered:—From two to three o'clock, 1,392; three to four, 2,350; four to five, 1,799; five to six, 767; six to seven, 1,924; seven to eight, 2,110; total, 10,322.

"The Smoker," a small painting by M. Meissonier, was sold by auction last week, in Stratton Street, for 1,002*l.* 15*s.* As it measured 8 inches by 5¼ inches, the price was about 24*l.* per square inch.

An Exhibition of woodcut reproductions from drawings by Japanese artists may now be seen in the King's Library of the British Museum. An exhibition of original drawings will shortly be held.

The General Council of the Glasgow International Exhibition, 1888, have agreed that any surplus is to be handed over to the Corporation of Glasgow, to be applied towards erecting and maintaining a gallery of art, or museum of science and art, or otherwise to promote science and art in the city.

The Report of the Edinburgh Architectural Association states that during last year thirty-seven new members have been added to the roll, and twenty-seven had for various reasons resigned, leaving a total membership of 303. The financial statement shows a balance in hand of 154*l.*, and the balance to the credit of the Sketch Book Committee is 21*l.*

The Mayor of Lancaster has announced that, in addition to his gift of a school of art and art gallery as a memento of the Queen's jubilee, he intends to make provision for technical education in the town, and will provide a laboratory, classrooms, and small lecture theatre, the latter being also adapted for the teaching of the science of music.

The Architectural Association held the usual fortnightly meeting on Friday evening last, Mr. J. A. Gotch, president, in the chair, when a paper on "Decorative Metal Work" was read by Mr. H. Longdin. The report of the meeting will appear next week.

Mr. John Ruskin has presented the Catholic church at Coniston with a stained glass window representing St. John in the Isle of Patmos.

Mr. A. Carnegie has informed the Lord Provost of Edinburgh that before leaving for the south of France he had deposited 50,000*l.* in a bank, subject to the draft of the Lord Provost or any officer designated by him. The money is for the erection of a public library.

Sir P. Cunliffe Owen was on Saturday presented with a testimonial, in recognition of his services as secretary to the executive of the Colonial and Indian Exhibition. It consisted of a silver-gilt tea service, including a large tray, tea urn, tea and coffee pots, sugar basin and ewer, with a salver and water or claret jug, and the centre of the tray bore a suitable inscription.

The Fountain presented to the University of Edinburgh by Dr. W. F. Cumming was unveiled on Saturday. It was designed by Mr. Sydney Mitchell, architect.

Colonel Haywood, the engineer to the Commissioners of Sewers, is seriously ill, and has been ordered to proceed to a warmer climate.

Okehampton Town Hall is in so unsafe a condition that people are warned about the peril of attending the Sessions Court.

A General Hospital, to be called the Victoria Hospital, is proposed to be erected at Bournemouth.

Mr. H. Holtom, of Dewsbury, has prepared plans for the proposed erection of a large public hall and public offices.

The Dean and Chapter of Hereford Cathedral have formed a committee to consider the practicability of rebuilding the west end of the building as a memorial of the Queen's jubilee. The cost is estimated at 80,000*l.*

The St. Martin-in-the-Fields Vestry are considering the question of erecting a new vestry hall.

The Old Runic Cross at Rushwell, in Annandale, is to be preserved in a recess which is to be formed in the church wall.

The Duke of Westminster has given a site in Buckingham Palace Road and 3,000*l.* towards the erection of a church, which is to be erected from the designs of Messrs. Demaine & Brierley, of York.

St. James's Church, Birkdale, was reopened on Sunday last, after having been enlarged and decorated from the designs of Mr. J. Francis Doyle, architect, of Liverpool and Birkdale.

Plans have been prepared by Mr. Fairbank, C.E., for a proposed steam tramway at Flamborough, from Marton to the North Landing.

New Filter Beds, designed by Mr. J. Hepworth, C.E., of Carlisle, in connection with the water supply of that town, have just been opened.

The Architect.

THE WEEK.

THE new year's number of *L'Art* opens with an article that must appeal to Englishmen, since it is a comparison between "Don Quixote" and "Hamlet," which is translated from an unpublished fragment by the Russian novelist TOURGUENEFF. He says that the two works appeared in the same year, and that the two authors died on the same day, April 26, 1616. SHAKESPEARE died on April 23, and, as was pointed out by CARLYLE, the brave MIGUEL was smoothed right nobly into his long rest ten days earlier. But coincidences of date are of no importance when the works of the two literary giants are being considered. M. TOURGUENEFF is right when he says that the simultaneous appearance of "Hamlet" and "Don Quixote" is significant, since they represent two aspects of humanity, one or other of which is exemplified by most men. *L'Art* will henceforth follow the example of other periodicals by introducing articles of that class, and stories by the leading French novelists, among the essays on art by experts which have given it character. The illustrations are of a wide range, since they comprise ancient statuary, Mediæval sculpture, and caricatures by RANDOLPH CALDECOTT. There is also a very effective etching after N. MAES by M. MORDANT, a sketch by M. BONVIN, and a facsimile of an architectural drawing by DU CERCEAU. The new volume commences auspiciously.

THE three vacant professorships in the Ecole des Beaux-Arts have been filled up. M. MONDUIT, architect, is appointed professor of construction, in place of the late M. BRUNE. M. JULLIEN, another architect, succeeds the late M. CHEVILLARD as professor of perspective. M. DELAPLANCHE, the sculptor, takes M. HIOLLE's place as professor of modelling.

THE house at the corner of William and Dalrymple Streets, Greenock, in which JAMES WATT was born, in 1736, was taken down towards the close of the century, and another erected on the site. The second house is now doomed to demolition by the Improvement Trust, and some of the inhabitants are of opinion that the site should be utilised for the erection of a national memorial of the great improver of the steam-engine. It so happens that up to the present Greenock has not done much for its distinguished townsman. Shortly after his death it was resolved to erect a bronze statue, and a large sum was collected. Before any arrangements for the work could be made, a son of JAMES WATT came on the scene and offered a replica of the statue in Westminster Abbey by CHANTREY. The replica is now in the Watt Library, and is the only monument in Greenock to JAMES WATT. It is very little known to the general public or to visitors. Cartsdyke has wisely taken advantage of the indifference of Greenock, and has gained credit by claiming to be the birthplace of the engineer. At one time it was proposed to erect a Watt Memorial Hall on the site of the house, but the notion that finds favour now is to have an open space with some kind of memorial in the centre.

M. EDOUARD RENAUD, who died a few days ago in Paris, was one of the oldest members of the profession in the city. He was born about 1810 at Gravelines. In 1848 he attained sufficient importance to be nominated Commissary for the Palace of St. Cloud, and he was able to keep it from devastation by the insurgents. It was, however, preserved to meet with as bad a fate afterwards. The next year M. RENAUD obtained his first medal from the Salon, and he was also awarded medals in 1857 and 1878. He was nominated to the Legion of Honour in 1858. M. RENAUD was the architect of the Hôtel de Ville of Cambrai, and among his numerous Paris buildings was the Gaîté Théâtre, on the Boulevard du Temple.

A CURIOUS question cropped up in the Edinburgh Small Debt Court on Monday. A man was summoned to pay his proportion of the cost of repairing a stack of chimneys in the building of which he occupied a part. The claim was only 1*l.* 10*s.* 4*d.*, but it was resisted on the ground that by the conditions of the lease the defendant was exempted from all repairs of the roof, and he argued that as a chimney formed part of the roof there was no case against him. This ingenious point was opposed on behalf of the claimant, and it was said that the gable wall might with as much reason be supposed to form a part of the roof. The Court held with the claimant, and henceforth there is a precedent for at least one side of the Border.

THE Académie Julien is one of the great non-official schools of Paris, where the highest instruction is obtainable at an almost nominal price. When it is said that the professors are MM. BOUGUEREAU, BOULANGER, LEFEBVRE, and T. ROBERT FLEURY, the painters; M. CHAPU, the sculptor; and M. CUYER, the anatomist, there is little need to speak of the character of the teaching. The artists do not suppose that their duty is fulfilled by an occasional promenade through the ateliers; they all work hard, and practically explain the shortcomings of the individual students. Anyone who has seen a single one of the chalk studies on which M. BOULANGER has operated will understand the extent of the teaching. It is no wonder so many English and American students find their way to the Académie, and that among the prize-winners in the competition which has just been decided we find such names as MATHEWS, CRESSWELL, SMALL, MAJOR, GOODMAN, COLLINS, MARQUIS, TROTTER, CAUSLAND, DILLON, and BLOOD. A banquet was lately given to the professors by the students, who were able to congratulate M. LEFEBVRE on his receipt of the Medal of Honour of this year's Salon. M. BOULANGER in the course of his speech gratified the students by the announcement that at the last competition in the Ecole des Beaux-Arts, out of the eight prizes awarded seven had been carried off by the Académie Julien.

ONE of the recent commissions of the City of Paris was an equestrian statue of ETIENNE MARCEL, the provost, who was the most noted man in the city for a part of the fourteenth century. It was designed by the late M. IDRAC, but on the death of the sculptor the work was entrusted to M. MARQUESTE, who had been a holder of the Prix de Rome. It was specified to cast the man and horse in a single piece, and from their size and arrangement the undertaking was considered to be of great importance. When the sculptor examined the bronze casting he was surprised to find that it consisted not of one but of eleven pieces. The municipal authorities are inquiring into the affair, which M. MARQUESTE declares is prejudicial to his work, and he ascribes much of the adverse criticism with which the group was received to the circumstances under which his model was reproduced. The work costs the City of Paris about 6,000*l.*, and is to be placed in front of the Hôtel de Ville.

THE Glasgow Town Council have resolved to expend 9,000*l.* in erecting workmen's dwellings and shops on the vacant ground belonging to the Corporation on the east side of Salt Market. It is calculated that tenements can be provided which will return 1,120*l.* a year, that is, 640*l.* from fifty dwellings, and 480*l.* from eleven shops, or, deducting 25 per cent., 825*l.* The value of the land at 5*l.* a square yard is 9,630*l.*, on which the interest at 5 per cent. is 481*l.* 10*s.*, and calculating the interest on 9,000*l.* at 3½ per cent., it amounts to 315*l.*, or in all 796*l.* 10*s.* In this way the income appears to just balance the interest. It is argued by the opponents that so large an income is not to be assumed, since, if such rents were paid regularly, speculators would have made the experiment long ago. But, looking at the condition of things in Glasgow, the laws of political economy may be a little strained if, by doing so, some of the misery of the humbler inhabitants of the city can be abated. Builders are always rather shy of undertaking workmen's dwellings unless in cases where they can go very near breaking the by-laws. That course is difficult when many tenements have to be provided in one building, for the scale insures solidity if constructed. It is, therefore, far easier for a workman to find a fairly commodious dwelling at a cheap rate within the metropolis than in Glasgow or Edinburgh.

LA TOUR, THE PASTELLIST.*

ANYONE who has read a book by M. CHAMPFLEURY will always be glad to meet with a new one from his pen. In an age which seems to have set up a machine as an ideal, and when the highest life is supposed to be led by those who form part of a crowd formed on the same pattern, he is an advocate for freedom. He was the first writer who rallied to the aid of COURBET when connoisseurs, courtiers, and critics united to condemn the painter, and would have sent him to New Caledonia or to the guillotine. M. CHAMPFLEURY was in consequence supposed to be the champion of realism in its worst forms; indeed, M. LOUIS VEUILLOT considered him to be pre-eminently the "apôtre du réalisme." But M. CHAMPFLEURY might with as much reason be called the apostle of Academicism. He is an opponent of all isms, and he knows that if the realists were possessed of power they would be as tyrannical as any of the old fogies of the Institut under a monarchy. The principle he advocated was "sincerity in art," and every artist was left to decide with his own conscience what meaning he was bound to give to the words. All that M. CHAMPFLEURY desired was that a work of art should correspond with the individuality of the artist who produced it. He rejected all the recipes for making a work in the Grand Style with as much indifference as if they were excerpts from primitive cookery-books. M. CHAMPFLEURY, in holding opinions like these, was only, as he acknowledged, re-echoing the words of JOHN CONSTABLE, whom he reverences as the father of the modern school of France. The English landscape painter did not ask himself, as became a student of the Royal Academy, how CLAUDE or GASPAR POUSSIN would arrange the subject if they had to represent a mill or a lock or a canal, and his revolt against routine inspired DELACROIX, and through him a host of painters in Paris studios. CONSTABLE was an iconoclast, and he found pupils more apt on the east side of the Channel than on the west. The new idea passed from the artists to the writers, and when THÉOPHILE GAUTIER implored the art student to burn his books, to tear up his engravings, to break his casts, and to forget RAPHAEL, HOMER, and PHIDIAS, he was only supposed to be freely translating CONSTABLE'S thoughts.

M. CHAMPFLEURY was not satisfied with expounding the doctrine of CONSTABLE for the benefit of painters: he applied it to himself. In his writing he does not bow down before the models of literature that the Academy set up, nor follow the approved rules for the composition of an essay. He admires SHAKESPEARE, and, unless we are mistaken, finds a kindred spirit to his own in STERNE. Scotsmen will not readily pardon M. CHAMPFLEURY for supposing that BURNS was an Irishman, but he may have believed that the proposal of MOORE was carried out, and that OSSIAN was made over to the North for ever in exchange for the Ayrshire ploughman.

MAURICE QUENTIN DE LA TOUR, the pastellist of portraits, is a subject that is well adapted to be treated by M. CHAMPFLEURY. It cannot be said that the artist's name is well known in England; and although he was the King's painter, a councillor of the Academy of Painting and Sculpture, and the founder of one of the provincial schools, it must be admitted that in France he is no longer as famous as some of his contemporaries. It is not, however, M. CHAMPFLEURY'S intention to advocate a reversion of opinion in respect of the artist. Like all biographers, he is bound to take some interest in his subject; but LA TOUR has rather less importance in the book than the people who sat to him for their portraits, and they are of a class that affords sport to a writer who is apt to think that the world is a stage, and life a comedy for the amusement of a philosopher.

As LA TOUR lived between 1704 and 1788, he belonged to the time when the Fates were preparing the great Revolution. He was a friend of many of the men whose words helped to bring about that event. He drew the portraits of D'ALEMBERT and ROUSSEAU, and it was his privilege to be made the subject of an analytical study by DIDEROT. Like many others in that time he talked a little of the philosophic jargon that was in vogue, but he had no objection to be patronised by any of the hangers-on of the Court, however immoral, and he never seems to have had a scruple about the way in which the money was obtained that was paid over to him for the paintings. According to his own account, his highest ambition was to soar above all human weakness, to despise riches, and to love philosophy; but the pupil of the Stoics was the portraitist-in-chief of the demi-monde, and was proud of his office. His note-book reveals that he was enamoured of virtue, and his letters show that he was so overwhelmed with the honour of painting a portrait of Madame DE POMPADOUR, that he feared a fever must ensue. It is this contradiction of theory and practice which gives an interest to LA TOUR. We are told by SCHILLER that the artist is the child of his time, and the French eighteenth century would appear incomplete if the pastellist were absent. It was not only that he was favoured by one class of patrons, and was so endowed as to be competent to represent

> Quips and cranks and wanton wiles,
> Nods and becks and wreathéd smiles,
> Such as hang on Hebe's cheek,
> And love to live in dimple sleek;

but the very medium he employed was a fit symbol of a state of things that was doomed to be cut short by the invention of the benevolent Dr. J. I. GUILLOTIN. It is quite true, as M. CHAMPFLEURY points out, that crayon drawings and pastels do contrive to subsist, and portraits of some of the men and women who lived in the time of HENRI IV. and LOUIS XIII. are preserved for us in that way; but it must be allowed that pastel paintings and crayon drawings need the greatest care, or they will succumb before many years elapse. They are for an age, and not for all time like paintings in oils. As the author of "Manon Lescaut" wisely said, "They will not stand unless they are covered with glass."

The question will naturally be asked why any clever man (and LA TOUR was one) should select a medium for painting that is so evanescent, when he might use one that was more enduring? In LA TOURS' case the answer must be that he was driven to employ it through necessity. He was obliged to quit his native place, Saint-Quentin, in his eighteenth year, and to make a living by means of such instruction as he had received from the local drawing-master. It is said that one of the first places where he tried his fortune was London, and that a great influence was exercised upon him by VANDYKE'S and LELY'S portraits, which he saw in England. But this part of the artist's life lies in obscurity and might reward investigation. After a time LA TOUR found his way to Paris, where he received instruction from one DA POUCHE. At that time the crayon portraits of a Venetian lady named ROSALBA CARRIERA were the fashion, and the artist held a position that corresponded with ANGELICA KAUFFMANN'S a few years afterwards in London. LA TOUR must have seen ROSALBA'S pastels, but to what extent he practised the art remains unknown, for not until 1737 did his name appear in the catalogues of the Salon. In that year he made his *début* with a portrait of Madame BOUCHER. It is worth noting that among the five portraits he exhibited in the year following was one of "M. MANSARDE, architecte du Roi." He was not, however, one of the great architects of that family. But, although he kept aloof from the Salon, LA TOUR must have possessed a great reputation in Paris. The high compliment of imitation was paid to him. A pamphleteer in 1740 charges him with having created a crowd of worthless imitators, and a champion was found in a dilettante abbé who maintained that the imitators were able men, although they were far from approaching the ability of LA TOUR, who was inimitable. In 1743 we find a critic saying that the artist's works were so exalted that no praise could do them justice, and the best policy was to be silent before such masterpieces. Two years afterwards another critic is found declaring that LA TOUR was the king of pastellists, and exclaiming, "What expression! What Nature! Look at the way he has rendered the Procureur-Général and M. DUVAL! In these works he surpasses himself—LA TOUR is vanquished by LA TOUR." The vocabulary of eulogy was so early exhausted it was difficult for the critics who came afterwards to find nouns and adjectives to

* *Artistes Célèbres—La Tour.* Par Champfleury. Paris: J. Rouam. London: Gilbert Wood & Co.

apply to the drawings which continued to be exhibited up to 1773. At last it could only be said that his works were not imitations, but Nature itself. LA TOUR was held to be in art what PASCAL was in literature—a reflection of the truth, without any of the contortions that are common in man's work.

It was not surprising that DIDEROT, who had sat beside weavers at their looms, and wormed out the experience of workmen in order to get at reality before writing his technical articles, should be eager to study the manner of an artist who had gained so wide a reputation as LA TOUR. The two men met, and DIDEROT acted the part of a modern interviewer. By a series of able questions he discovered that the artist was not of those who believe in the advantage of painting the lily, and that he held by a theory which in our time is called realism. It was not merely LA TOUR'S theory of æsthetics, but his mode of working that DIDEROT wished to understand. Apparently he imagined that a painter, like a poet, ought to have an eye in a fine frenzy rolling while standing at his easel, and he found that LA TOUR was as cool as a tragedian in what seems a whirlwind of passion. His verdict was that the painter was "un machiniste merveilleux"—a master of technique, but wanting in "go." This decision is not quite satisfactory to M. CHAMPFLEURY, but it was confirmed by the critic of 1763, who said that LA TOUR was of a cold and limited nature, and could neither express passion nor excite enthusiasm.

The Paris of those days was not a place for enthusiastic painters. If we may judge from the portraits which are reproduced in M. CHAMPFLEURY'S book, it was then necessary for everybody to have a constant smirk on their faces, and that expression is not suggestive of passion or enthusiasm. RESTOUT, the Rector and Chancellor of the King's Academy, smiles as he gazes at the invisible model which he is about to draw; the Abbé DE BLANC, the art-critic, smiles while his eyes expand in roguery; the ballet-girls and opera-singers smile, as in duty bound; and dowagers, whether lean or bloated, contort their faces to ape the mode. LA TOUR himself sets the example to his sitters, and seems to say, "See how happy I appear to be, after so many rehearsals before a looking-glass." The only sober face in the collection is that of a harlequin. Looking at this everlasting grimacing, one is almost compelled to swear against DA VINCI, who painted and drew so often that kind of smile which, as old MENENIUS said, "ne'er came from the lungs," and of whose practice in that respect LA TOUR was an imitator.

LA TOUR was, however, able to hit the taste of his day by his portraits, and he took care to demand very high prices for them. Judging by the letters which have survived from that time, ladies fancied that their reputation was insured if he would condescend to make them subjects. Sometimes the man who had to pay for the work did rebel against the price; but what chance was there in the courts against an artist who was one of the tenants of the Louvre? He made money, and at his death a part was left to the Académie Royale to found a prize of 12*l.* a year, which is now vested in the Ecole des Beaux-Arts.

LA TOUR was, as we have seen, a fashionable portrait-painter, and as such had much in common with artists of that species in all days. But from the time in which he lived, and his peculiar environment, he acquires an interest which his works may not entirely merit. M. CHAMPFLEURY is the kind of writer who can play with characters as if they were Dresden or Sèvres figures, and the eighteenth century affords opportunities for his way of treating history. LA TOUR, with his philosophism and his imbroglios, was a sample of the products of that age. He was a hero to grand dames and *figurantes*, and he was so assured of their power that he could dare to be rude to the King himself, the Bien-Aimé. He is a difficult subject to write about, and in all France there is no writer better fitted for the task than the Conservator of the Sèvres Museum.

Mr. John Taylor has presented the Northampton Museum with some fragments of ancient ecclesiastical buildings which were unearthed in St. Katherine's, consisting of a well cut label termination carved as a female head, and one arch stone, probably forming part of a rich Norman doorway, both in Ketton stone.

NORTHERN ARCHITECTURAL ASSOCIATION.

ON Wednesday, the 22nd inst., an ordinary sessional meeting of the Northern Architectural Association was held in the Old Castle, Newcastle. Mr. E. Shewbrooks presided. The hon. secretary (Mr. F. W. Rich) intimated that a communication had been received from the Royal Institute of British Architects, stating that a general conference of British architects would be held in London during the week commencing May 2, 1887, and asking that the Northern Association should nominate a member to sit as representative on the special committee. Mr. Hoskins was appointed to represent the Association. The hon. secretary also read a communication from the Manchester Society of Architects, pointing out that preparations were being made for a Jubilee Exhibition at Manchester, and stating that the primary object of the Exhibition was to illustrate the art progress of the nation during the Queen's reign. The committee of the Exhibition were willing to allot a space as an architectural court in proximity to the fine art section, in which might be exhibited designs for or drawings and photographs of buildings erected since Her Majesty's accession to the throne. The secretary was instructed to say in reply that the communication had been laid before the members, and also that the Exhibition about to be held at Newcastle would perhaps claim the attention of the members first. It was also intimated that the Association would offer a prize of 1*l.* 1*s.* for the best drawing of an oriel window, of Elizabethan or any subsequent English style, for a room 12 feet high, and that the hon. secretary would give a prize of 3*l.* 3*s.* for the best drawing of a doorway in the style of the fourteenth-century English Gothic, the drawings to be sent in on Monday, March 21. The hon. secretary then read a paper on "Architectural Pupilage, and its Bearings on Federation." After a short discussion on the paper, the meeting terminated.

CHRIST CHURCH CATHEDRAL, DUBLIN.

THE new life of Christ Church Cathedral dates from the day when it entered the mind of Mr. Henry Roe to invoke the genius of Mr. Street to recover from the fragment of a church, "so mutilated and degraded as almost to have dropped out of the category of cathedral," the whole design of a church of such unique and characteristic beauty as exists nowhere else in Great Britain and Ireland. It was a remarkable restoration, and it stood when reopened in 1878 as it stood in 1230. Then it might have been supposed new interest was exhausted, but year by year, even month by month, the unworked mine of archæological interest in Christ Church continues to develop itself. This past year has been specially signalised by the discovery of the cloistral buildings. So far back as 1881 the architect in charge of the cathedral, Mr. Drew, in the course of one of those minute examinations of the old substructure of the crypt of 1170 which are periodically required, noted a few worn stones—footworn, apparently. The question arose, if so, when, and by what feet? At once a clue was suggested. There was an old archway built up, leading, perhaps, into a cloister walk, and, if so, worn, among the fall of many feet, by those of St. Lawrence O'Toole himself. If leading into the western cloister walk, then this cloister was 8 feet below the present porch level, far deeper below the sward outside than had been ever surmised. Pursuing his investigations among old documents in the Cathedral, Mr. Drew propounded a probable plan of the ancient cloisters, and went further in prophesying that beneath the soil remains of those cloisters might yet be found. Beyond the most sanguine expectations this dream was realised when, in the spring of this year, the Open Spaces Committee of the Mansion House Relief Fund were permitted to undertake extensive excavations in the "precinct." Exactly on the lines laid down by Mr. Drew the remains of the ancient chapter-house were disinterred, and have been repaired, and are maintained in view; and there were also traced the cloister garth, the cloister walks, the day-room of the monks, and the great hall of the monastery.

The last discoveries—if the revival of knowledge which was possessed by some antiquarian scholars a century ago can be so called—are among the literary remains. Christ Church Cathedral, in all its vicissitudes and neglect, in its burnings and pillages, has preserved safely a vast body of documents, upwards of 1,000 in number—MSS. dating from the time of Henry II.—still well kept, and even yet a mine of unexplored antiquarian interest. There is some interest attaching to the incident which lately led to an exploration of these possessions. It has been but lately pointed out to the Dean and Chapter of St. Patrick's Cathedral, hitherto proud in the possession of a grand symbolic capitular seal, dated 1584, that their seal was a spurious one, and, in fact, the stolen trade-mark of one Estienne or Stephanus, a noted printer of Paris in the sixteenth century. The shock was a severe one to antiquarian susceptibilities, but a reference to Estienne's famous work, the

"Prædium Rusticum," in Trinity College Library, and other books in Marsh's Library, Dublin, conclusively proved the fact. A question then arose as to whether the original ancient seal of St. Patrick's might yet be found, and a search was set on foot by the Rev. Canon Leeper, Prebendary of St. Audoens, the learned author of the "Handbook of St. Patrick's Cathedral." The "Novum Registrum" of Christ Church Cathedral is a very remarkable work, being a splendid transcript by Dr. John Lyon, made about 1780, of many of the then decaying MSS. in the Cathedral collection. It is contained in three fine folio volumes of good clerkly penmanship. A search in the first folio revealed a drawing of a very rude seal of the Chapter of St. Patrick's. St. Patrick is represented as a mitred bishop and holding a crozier, and the date about 1280. In the second folio, however, were found delineations of three splendid seals attached to one document—the seal of the Prior and Convent of the Holy Trinity, of the Cathedral of St. Patrick, and of Archbishop Talbot, date 1480. Still more surprising, there was found, on referring to the Deputy Keeper of the Records, that in his custody, among the rolls of Christ Church Cathedral, was the original deed of Archbishop Talbot, with its magnificent seals still attached. This is the more surprising, as in most earlier and later documents the seals have disappeared, and in even old catalogues of them the record "Sigilla jam avulsa" is the normal entry. These seals are of great size, and in high and bold relief and of great interest, and steps are being taken to produce carefully-restored models of them.

This notice may conclude with calling to mind some of the antiquarian treasures which the Christ Church Cathedral collection contains, irrespective of a vast number of miscellaneous documents, such as Papal bulls, charters, wills, and ecclesiastical deeds, &c. First among them stands the "Liber Niger," a MS. in fine preservation of no less than 550 pages, containing a most miscellaneous collection of curious old monkish documents, written in what is known as courthand by a convent scribe in 1340. As but little of the contents are known, it is to be hoped that an effort will be made to transcribe and translate the whole. This MS. and its fellow, the "Liber Albus," contain nearly all of vague or traditional information from which the annals of early Dublin are derived, and it is questioned that they have been correctly read therefrom by even such scholars as Ware. The White Book, or Liber Albus, dates from 1490, and is the work of a scribe by name Thomas Fyche, and contains chiefly old statutes and grants, most of which have been transcribed by Dr. John Lyon in the "Novum Registrum." There are also the "Repertorium Viride," a volume of the contents of which we have no present information, two parchment-bound volumes containing a list of benefactions, and some curious old leaseholds, held under the Prior and Convent and subsequent Deans. In the Cathedral, also, is stored a series of Chapter Acts, dating back to the Commonwealth, and containing, no doubt, much of historic interest in times in which the old Cathedral played an historic part. Nor is the rich list of literature of Christ Church closed with that of the documents in the Cathedral strong-rooms and the public Record Office. In the library of Trinity College, Dublin, is preserved the "Book of the Obits of Christ Church," which was edited and published by the late Dr. Todd, F.T.C.D., many years ago. In the Bodleian Library are to be found the magnificent illuminated Service Books of the Church, which once stood upon the old brazen eagle of the fifteenth century, and which, in justice to Ireland, ought to be restored to Dublin, from which they were at some time dishonestly abstracted.

CONSTANTINOPLE.

CONSTANTINOPLE, indeed, is a veritable whited sepulchre, says a correspondent of the *Times*; seen from a little distance it is a dream of unapproachable beauty, which a nearer approach shows to have been only a dream. What sight can compare with the view of the Seraglio Point from the Golden Horn about sunset? Can anyone ever forget it who has gently descended the Bosphorus in a caïque—the most perfect mode of progression yet discovered—and has seen the seven hills of Stamboul standing out against the red of the western sky, and presently witnessed the marvellous transformation as the tall gleaming minarets cast back the rays of the moon? Distance, indeed, lends a potent enchantment to such a scene—a spell that holds one breathless till one comes too close, and then it is broken. It is a pity, but one ought not, in consideration for one's finer sensibilities, to become too closely acquainted with the buildings which form so picturesque a whole when seen in due perspective. The truth is that the mosques of Constantinople will hardly stand the test of detailed and separate examination. They certainly will not bear comparison with those of Cairo. We shall find no such variety as exists in two such different buildings as the mosques of Tulun and Kait Bey. All the mosques of Stamboul are constructed after one pattern, and that pattern is the church of Santa Sophia. There are architects who see in this noble edifice the perfection of every canon of artistic construction. And, from within, there can be no doubt that the splendid proportions of the arched sides, and the dome, and the shell-like apse must impress the most ignorant visitor. It is true that the Turks have not improved the aspect of the interior with their great flaring medallions inscribed with the names of God and the Prophet and the four orthodox Caliphs, or by the inappropriate private box which they erected for the accommodation of the Sultan when he happens to come to prayers. These are sins of commission of an unpleasantly glaring kind, but the sins of omission are even more distressing. The medallions and the Sultan's box might be removed, and leave no fatal vacancy behind, but who can replace the mosaics that are daily falling out upon the floor, and are even picked out by the attendants to be sold to western tourists? Who can restore the obliterated portions of the four seraphim who spread their wings beneath the spring of the dome, or the countenances of saints and martyrs on the walls which Moslem iconoclasm has partly effaced? Santa Sophia is becoming a ruin; everything that is movable is suffered gradually to fall to pieces, and is even wantonly destroyed by the "caretakers"—save the mark!—of the mosque-church.

But all the ruined beauty of this great church cannot reconcile us to its exterior. Hemmed in by other and insignificant buildings, one has difficulty in getting a good view of the outside, and is compelled to see it too near for advantageous effect. It is doubtless a prejudice, but those who know a true Cairo dome can never accommodate their taste to the dumpy cupolas, or agglomeration of cupolas, like an elaborate wedding-cake, of all Constantinople mosques. However, for good or ill, the external features of Santa Sophia have impressed themselves to such an extent on the Turkish imagination that the architects can devise no other form of building. We pass from mosque to mosque, and every one of them is more or less a copy of Santa Sophia; the domes are too corpulent, the minarets too pointed, and the whole exterior lacks light and shade. The Suleimaniya, or mosque of Suleiman the Great, is, indeed, internally a splendid building, that will bear comparison, some think favourably, with Santa Sophia itself. Another fine mosque is that of Sultan Ahmed, with its six minarets, which help the stranger to distinguish it externally from its two resembling rivals. As your eye runs along the line of domes and minarets that extends from Eyoub to the green gardens of the old Seraglio, almost identical external features meet you in every case. The crown of the city of the seven hills is composed of jewels of identical size and shape. There is no invention or originality about Turkish architecture, and, however good a model may be, it is monotonous to find even Santa Sophia repeated *ad infinitum*.

The chief characteristic thing in Turkish decoration is the general employment of mural tiles. The idea, of course, came from Persia, but the Turks, while they were as a rule wonderfully deficient in the arts, seem to have succeeded in bringing the technique of pottery to perfection, and the theory which ascribes almost all the best Damascus and Cairo and the so-called Rhodian tiles to the period of Turkish supremacy in the sixteenth century rests upon more evidence than many people think. At all events, we hear little or nothing of tiles in Egypt before the Turkish conquest. There are no tiles to compare in fabric with those of Constantinople. Everyone knows their general appearance, the large designs of flowers and leaves in blue of two shades, with a large proportion of brilliant red decoration in relief. They are commonly known as Rhodian, but there is a difference between the two which is easily recognised. The duller colours and less skilful baking, blurred outlines, and imperfect glaze of the true Rhodian tiles and vessels, almost as dear to the artist as the soft Damascus hues, are easily distinguished from the clear hard outlines, brilliant colours, and transparent glaze of the Constantinople tiles. The theory seems to be that while Persian prisoners taught the people of Rhodes to manufacture the raised red tiles known by their name, other Persians did a similar service to the Turks of Broussa and Constantinople. The designs were not unlike one another, and the raised red is common to both, but the Turkish variety was developed to greater chemical perfection than the Rhodian, possibly by reason of more suitable earths. Some very fine examples of the true Turkish tile are to be seen in the walls of the Ahmediya Mosque, where the mistake has been made of trying to enlarge the area covered by the tiles by imitating them in paint—a disastrous failure. The little mosque of Rustem Pasha, Suleiman's vizier and son-in-law, has perhaps the best tiles in any mosque in Stamboul, but most of them possess some remnants of this beautiful style of mural decoration. There are also good specimens in private collections, and Mr. Wrench, the British Consul, possesses some which are probably unrivalled. Many examples may be seen in the British and South Kensington Museums, as well as in private houses in London, and at South Kensington is a large lamp of the same manufacture, added to the collection a year or so ago.

These lamps, and, indeed, all kinds of Turkish and Rhodian pottery, except tiles *in situ* (separate tiles are hard to find), are very rare in Constantinople; but I have seen a few exceedingly fine specimens in the little museum close to the Seraglio, which is now being put into excellent order by Hamdi Bey. This, by the way, is the "Imperial Museum" of Constantinople, though it could be put bodily inside the Elgin Room of the British Museum. Nevertheless it possesses not a few good things of a miscellaneous order. The fruits of Schliemann's and Cesnola's excavations are represented in some degree of completeness here; the collection of terra-cottas is interesting; and few objects can excel in historical associations the bronze serpent's head from the famous tripod which was taken from the Persians at the battle of Platæa, was seen by Pausanias at Delphi, and finally set up by Constantine in the hippodrome of his new capital. The contents of this little kiosk consist almost entirely of Greek, Cypriote, Assyrian, Egyptian, and other antiquities; there is little that is Turkish or Mediæval, with the exception of the earthenware lamps I have mentioned, and possibly some of the coins, which are not yet displayed.

MR. CHRISTIAN'S REPORT ON THE DESIGNS FOR THE LIVERPOOL CATHEDRAL.

(*Concluded from page* 363.)

General Observations.

HAVING now described in detail the general features, merits, and defects of the respective designs, I will say a few words on the general subject, and afterwards endeavour to sum up, as nearly as I can, the balance of the whole.

I would first observe that, notwithstanding the remarkable care and elaboration with which the respective designs have been worked out, it must be considered, and doubtless their authors would agree, that they can only be properly taken as preliminary studies of a great subject, on which much more thought must necessarily be expended before the goal of perfection can possibly be attained.

That any one design in its present state is entirely satisfactory I cannot say, and I think the detailed criticisms given already will sufficiently show; but there is a further and larger question which must be faced, and that is, whether in any one of the designs can be found the church of the future most suitable for the cathedral of Liverpool. That it should be a church of grand proportions and noble form would, I imagine, be the general verdict of all good citizens; that it should have a spacious interior, well suited for the worship and teaching of multitudes, most would desire; and that it should be, like the church of Sta. Croce at Florence, at once a place for grand religious teaching and for beautiful memorials of truly worthy citizens, might be a dream well worthy of realisation, but of which none of the designs can be said to have completely solved the difficulties.

Mr. Emerson has evidently attached much importance to the embellishment of the city, by the striking and massive external proportions of his building, and it can hardly be questioned but that if translated into stone, notwithstanding the proximity of St. George's Hall, his building would hold its own, and be a substantial addition to its architectural beauty.

In designing the central dome, Mr. Emerson seems to have studied the great example at Florence; but has avoided its errors as regards the interior of the church, by the abundance of light which he everywhere proposes to admit.

Domes on churches, designed on Gothic principles as practised in England, have been heretofore unknown, but further south they are by no means uncommon, and there are notable examples in churches of Mediæval type, and I see no reason why one should be deemed out of place in a case like this at Liverpool. I believe that the late Sir Gilbert Scott, notwithstanding his intense love of English architecture, would gladly have built one had opportunity offered in his later days.

Mr. Brooks has put before you a powerful, and in many respects very beautiful, design, in the style of which he is an acknowledged master; but as a whole, not so striking externally as it would be beautiful within. It is not free from faults, which, though easy of correction, almost make one mourn their existence, compensated though they may be by so many excellences; but I cannot avoid the conviction that this building, as a whole, would be too lofty for its position. The height of the general mass is really great even for an ordinary site, but for one so circumstanced as yours it would, in my judgment, be too overpowering for its surroundings.

On the lowest part of the site the subsidiary building placed on the southern boundary would in some measure conceal this defect, but from other positions it could hardly fail to be felt that, in respect of general outline, the bulk of building was excessive.

The respective heights from the floor of the nave to the ridge of the roof are as follows:—

In Mr. Brooks's design	164 feet
In Messrs. Bodley & Garner's . .	139 feet
In Mr. Emerson's	121 feet

It must not, however, be overlooked that, excepting in the transepts, the loftiest portion of the building recedes considerably, but still the aisle walls are high, and the general mass very great. The central feature is, nevertheless, far less bulky than in other designs, and as a whole this design deserves very careful attention.

The design of Messrs. Bodley & Garner may be said to be more thoroughly English in character than either of the other two, and would on the whole produce a very fine church, of which the central lantern would be a notable and magnificent feature.

There is much to commend, and probably further study would ameliorate many of the faults, as I read them, and on which I have freely commented.

The design has serious weaknesses, but has also much strength, and is certainly worthy of most careful consideration.

Messrs. Bodley & Garner have also sent a drawing showing the original design by Sir Christopher Wren for rebuilding St. Paul's adapted to this site. Notwithstanding the great intrinsic beauty of that design as exhibited in the model, the plan was not one adapted to the requirements of worship as now understood; and although, as recorded, he was very reluctant to adopt the existing arrangement, one cannot but rejoice at the final determination which has given to posterity in the existing cathedral so glorious a monument of his unrivalled skill.

That was a preliminary study, and we see the final result. May one equally good proceed out of the studies submitted for your cathedral at Liverpool!

Conclusions.

You have now before you, I think, a sufficient description of the designs, their merits, and the contrary, as from careful study I have been able to read them. I have avoided as far as possible for the purposes of this report any allusion to minor discrepancies of drawings, &c., not affecting the general question, and all unnecessary technical details, giving only the results of repeated examinations of the drawings and reports submitted by the respective architects, and need not further trouble you on these points, but will add a few remarks on the general subject.

You will have gathered from what has preceded that I cannot speak of any one design as perfect in itself; each must be considered as a study, and each has both excellences and defects, and, bearing that in mind, I would say that for careful study of the whole scheme, and for adaptation of the design to meet all necessary arrangements for convenience and construction, Mr. Emerson's is in my opinion, on the whole, the best. Mr. Brooks's plan is very good, but must, I think, yield to that of Messrs. Bodley & Garner in respect of its principal feature and adaptation to modern requirements.

As regards elevation, and in respect of style, much must depend on individual preference.

There are three types of architectural treatment exhibited, which may be broadly classed as pure English, Franco-English, and Franco-Italian, but each equally claiming to be described under the general designation of "Gothic."

As regards the two first, and with the limitation I have in each case named, I cannot but on the whole prefer the design of Messrs. Bodley & Garner. In the last Mr. Emerson has taken a new and bold departure from ordinary forms, and has produced a striking design, which though distinctly differing, would more nearly harmonise with surrounding buildings than those more in accordance with ordinary Mediæval practice. Liverpool is a modern city, and it may therefore be questioned what is the right style in which to build its chief ecclesiastical edifice. Opinions on such a point will probably widely differ; but there is at least some consistency in taking as a guide the traditions of worship of the ancient National Church, and English forms would therefore seem to be most in accordance with the general national sentiment. But while taking this as a basis, I see no reason why there should not be considerable freedom allowed in the treatment of the subject.

Personally I should prefer a purely English design, if there were one entirely satisfactory; but that I cannot see to be the case, and though Mr. Emerson's is not perfect, it requires less of important alteration than either of the others.

I see no objection to his adoption of the dome, and concur in his view that in the dominating church of a considerable city such a feature would be of no little importance; but this effect of mass would also be obtained by the great lantern designed by Messrs. Bodley & Garner.

That I do not agree with Mr. Emerson in his preference for foreign detail I think I have made sufficiently clear, but his forms and outlines are capable of more purely English treatment if he desired to give it. That his design in respect of architectural features is capable of improvement no one can

doubt; but I am nevertheless of opinion that, taken as a whole, it is of those submitted the most suitable for the site, and one that if carefully and judiciously revised, and thoroughly well carried out, might be expected to produce a satisfactory result.

With these observations I must leave the matter in your hands; it demands, and I feel sure it will receive, very earnest and careful consideration; but while I have not withheld my own opinion, I think that to yourselves must be left the final decision.

That each of these gentlemen has done his best to treat the subject worthily cannot be denied; it behoves you therefore to ponder the matter well, and I trust you may be guided to a happy solution of what is without doubt a difficult question.

I have the honour to be, my lord and gentlemen, your faithful servant, EWAN CHRISTIAN.

8A Whitehall Place, London: December 2, 1886.

VENTILATION OF THE NEW REICHSTAG BUILDING AT BERLIN.

THE following letter to the *Standard* from Sir H. W. Tyler, M.P., gives an account of the arrangements adopted for ventilation in the Berlin Reichstag:—

During a recent visit to Berlin I had an opportunity of going in excellent company over the new German House of Parliament (Reichstag), now in course of erection in that city, and of noticing the forethought and accuracy displayed by the Germans in carrying out, not only their building arrangements, but also more especially a system for providing pure air with suitable temperature in the most careful manner. I was the more interested in the subject from having suffered, with others, in past years, from the defective drainage and villanous ventilation of our own House of Commons; and you may, perhaps, consider that the following brief description will be of interest to your readers. Architectural plans for the erection of this Reichstag building were obtained by a competition open to the whole of Germany; and the successful competitor—Herr Architect Wallot, of Frankfort-on-Main—was entrusted with the carrying out of the work. The jury selected to decide in this competition consisted of distinguished statesmen, experienced Government officials, and eminent architects. Before the building was commenced plans were further obtained, also by a competition open to the whole of Germany, for a system of heating apparatus and ventilation. The jury in this instance was composed of engineers, architects, and eminent scientific men from various parts of the Empire; and out of thirty-five schemes tendered, the prize was unanimously awarded to that of "David Grove" (a Berlin firm), for heating and ventilating. Mr. Grove is now, accordingly, superintending the necessary arrangements and the proper carrying out of the works during the erection of the building. If the building had been first erected it would have been impossible afterwards to add the numerous pipes, conduits, and air passages of large dimensions which are now being built into the walls, from the foundation upwards, for conveniently ventilating and warming or cooling the House, the lobbies, and the numerous rooms, all of which are carefully provided for. For the better conveyance of coal and the removal of ashes, as well as to prevent the entrance of smoke and the contamination of the air by these impurities, the boilers for generating steam are outside of the building, being placed at a distance of some 100 feet from it on the banks of the river Spree. The quantity of fresh air required to be supplied is calculated at 8,000,000 cubic feet per hour, and this is to be driven into as well as extracted from the building in proper proportions, so as to prevent any suction from ground gases, sewers, &c. The Grand Hall, or Parliament Chamber, is built to accommodate 399 members and 600 visitors, or in round numbers 1,000 persons, each person being supplied with 1,420 cubic feet of air per hour. Into this chamber the air is admitted near the ceiling, and drawn out through the floor, by which means it is hoped to obviate all unpleasant draughts. The fresh air required for the ventilating apparatus is, in order to obtain it as pure as possible, all taken in at the highest point of the edifice, about 250 feet above the ground, and is thence conducted into a special chamber of very large area, in which it is prepared for distribution into the different parts of the building. The preparation consists of cooling in summer, warming in winter, and drying or moistening according to the requirements of the season, so that throughout the whole year the air may be circulated through the building at an equable temperature, and in suitable condition as regards moisture. The heating surface required to warm the air for ventilating purposes is about 43,000 square feet, and consists of inoxydised wrought-iron tubing 2 inches in diameter. The same apparatus will be employed for cooling during the summer months, a liquid near freezing point being then made to pass through the coils. The quantity of warm or cold air is controlled by valves worked from the engineer's room. These regulating valves are constructed in the most simple manner, close-shutting, balanced, with bronze framing and adjusting apparatus. The desired maxima and minima of the temperature are signalled both in the heating chamber and the office of the superintending officials. For indications of the temperature, electrical and telephonic connections with signals from the maxima and minima thermometers to the necessary points are provided, as well as a pneumatic tube from the mixing chamber to the office for testing the condition of the air; and as regards moistening the air, the degree of saturation is raised in one chamber to the required percentage, and controlled by means of fixed hygrometers. The air thus carefully prepared flows into the various rooms and localities at a suitable height from the floor, and provision is made for the exact control of the temperature, and for regulating it quickly and surely during changes in the sitting of the House during divisions and other changes of circumstances. The sizes of the principal air channels are adapted to the constructional arrangements, and are large enough to insure the full effect of the ventilation at the same time through all the rooms, so that the velocity of the flow of air through the principal channels will not exceed 6 feet per second. The same principles are applied in the arrangement of the channels for carrying off the air as in those for drawing it in. There will be two expiration shafts of about 115 feet in height, at which height the air will be rejected, and the full effect can be reached with safety at all times, independently of external influences, and without raising the pressure of the air in the rooms. The principal air channel is about 270 square feet in section. By the complete separation of the air-inlets and air-outlets for the lavatories and closets from those of the other parts of the building, perfect security against the entrance of foul air into the rooms, passages, and corridors will be attained. The air is carried off as well under the seats as at the ceilings, assisted by gas-burners and exhausters worked by the water used for flushing. For moving the air for ventilating purposes an engine of 50 horse-power will be employed. In addition to the heating surface of 43,000 square feet for ventilating purposes, there will be about 15,100 square feet placed in and used for imparting the necessary warmth to the rooms; and it is also calculated that 21,000 lbs. of steam per hour will be required for the whole apparatus. The general working of the apparatus is extremely simple. It will be operated by one engineer and four attendants, one of which latter will be educated as a substitute, and will act in reserve and in case of any changes in the attendant staff taking place, and the management of the complete practical service will be in the hands of the chief engineer. He will give his instructions to the three attendants appointed to look after the separate parts of the building (middle, north, and south) respectively, and these will change places from time to time, so that each will be thoroughly acquainted with the working of all parts of the building. They will record and report continually on the thermometer, hygrometer, and anemometer indications, and will attend to the cleaning and maintenance of all the apparatus; and, when the whole is in full working order, a regular system of inspection will be organised, especially through the principal air galleries and heating chambers. You will see from the above description how carefully the whole system has been organised, how every detail has been thought out, and every contingency contemplated, and I am much mistaken if, when it has all been completed and set to work, it does not prove to be one of the most instructive lessons in this branch of sanitary science that has been yet afforded. I understand that the first cost is estimated at about 25,000*l.* for the whole of this ventilating, warming, cooling, and moistening apparatus.

THE LATE MR. WARRINGTON WOOD.

ON Sunday last Mr. John Warrington Wood, the sculptor died, in his forty-fifth year, at Warrington, his birthplace, after a short illness. He was son of Mr. James Wood, who was for many years deputy borough surveyor of the town. In early life he was apprenticed to a stonemason in the town, and his first effort in carving that brought him into notice was when the Manchester and Liverpool District Bank was being erected in Sankey Street. The stonemason who was engaged to carve the pillars for the front neglected his work through drink, and the foreman in his difficulty asked young Wood, who was a pupil of the Warrington School of Art, to complete the carving. This he did to the satisfaction of his master, and subsequently Mr. Wood, by hard study, rose rapidly, and executed the works which brought him reputation. For several years he lived in Rome, and only returned to Warrington a few months ago. Among Mr. Wood's more important works were *The Sisters of Bethany*, purchased by Mr. S. Rigby; *Eve*, now in the possession of Sir A. B. Walker; the heroic statues of *Michel Angelo* and *Raphael* in front of the Walker Art Gallery, Liverpool; the statue of *Sir A. B. Walker*, placed in the Gallery by the Liverpool Corporation; and *St. Michael over coming Satan*, in the Warrington Art Gallery.

ILLUSTRATIONS.

GORDON MEMORIAL INSTITUTE, LIVERPOOL.

THE building shown in the illustration was opened on December 11 by the Mayor of Liverpool. It was erected at the sole cost of Mr. William Cliff, of Claremont, West Derby, and is intended to benefit the working lads of the north end of the city. The site is on the east side of Stanley Road. In the arrangement of the several apartments within the building the aim has been to insure economy of management, absolute supervision, and such a facility of working as will permit of the fullest use being made of the entire Institution at all times. The Institution is approached from Stanley Road, and also from Primrose and Briar Streets. The main entrance leads into a spacious vestibule and hall, from which on either side corridors lead to the office, tailoring, plumbing, painting, and engineering apartments, also to the social room, classroom, and kitchen, and to the gymnasium, and the lavatories and bathrooms. From the main hall access is obtained to the large concert-hall, upon the first floor, by means of a spacious stone staircase. This concert-hall has seating for 800 persons, and has in addition an orchestra capable of accommodating 80 performers. In connection with the orchestra, ladies' and gentlemen's retiring-rooms are arranged, and the caretaker's apartments are upon the next floor above these. Two additional stone staircases have been provided at either end of the concert-hall, to afford ready means of egress in case of fire. The heating, ventilation, lighting, and sanitary arrangements of the Institute have all received careful consideration. The exterior of the building is a brick and terra-cotta treatment, with freestone dressings, and the general design is an adaptation of the style peculiar to Holland. In the main front a series of bas-reliefs have been introduced, illustrative of technical instruction, arts and sciences, music and painting, and literature and physical instruction. A further series of panels depict the arms of Mr. William Cliff and the title of the building, the arms of Lancaster and Liverpool, and above the doorway a medallion portrait of Her Majesty, the patroness of the Institution. Within the entrance-hall a marble tablet gives a short sketch of the history and objects of the edifice. The entire works have been executed at a cost of about 5,000*l.* from the designs and under the superintendence of Colonel David Walker, architect, of Liverpool, by Messrs. Morrison & Sons, contractors, Wavertree. The heating, lighting, and ventilation are by Messrs. J. R. Cooper & Sons, the decorative carving by Mr. Joseph Rogerson, and the gymnastic apparatus by Mr. Alexander, all of Liverpool.

CHURCH, SCHOOLS AND PRESBYTERY, WEST HARTLEPOOL.

THIS illustration is from a drawing that was exhibited this year in the Royal Academy. The design was prepared by Messrs. Dunn & Hansom, of Newcastle-on-Tyne, for the late Rev. Fr. Crolly, but owing to his death the work remains in abeyance. As is evident from the view, it was intended to build the church of brick.

DESIGN FOR ASSIZE COURTS, BIRMINGHAM.

MODEL COTTAGES, LONG DITTON.

PROPOSED HOUSE AT FELTHAM.

THIS house, designed for Mr. R. H. Smith, contains dining, drawing, and morning-rooms, and four bedrooms, with bath-room and water-closet. The materials are red bricks and tile hanging, with stone dressings to entrance doorway. The estimated cost is below 700*l.*, and the architect is Mr. H. P. Burke Downing.

THE ARCHITECTURAL ASSOCIATION.

THE fifth ordinary meeting of the Association was held on the 17th inst., Mr. J. A. Gotch, president, in the chair.

Mr. H. D. Appleton requested members to remove their class drawings before January 7.

The Société Centrale d'Architecture de Belgique, Mr. Appleton announced, had elected the Association Honorary Corresponding Society. The president, M. Jules Brunfant, of the Belgian Society, writing to the President of the Association, said :—"We had the pleasure of communicating to our Society at the last general meeting your favour of November last. The title of Corresponding Society that you offer us honours us much, and our Society confers with equal unanimity the same title on your Society. We willingly agree with you, Mr. President, in the wish that the correspondence which will be established between us may develop sentiments of affectionate sympathy and good comradeship between the members of the two Societies."

The following were elected members :—Messrs. R. A. J. Bidwell, J. Linton, C. D. Rutter, H. E. Napier, W. Goodwin, R. G. Borland, G. Horsley, F. L. J. Barrow, E. Banks, G. W. Sollan, E. A. Crooke, P. M. Roberts, E. A. Benstead, A. G. Turner, F. A. Kirby, P. Clark, H. Harris, and F. V. Stokes.

Mr. H. Longden read the following paper on

Decorative Metal Work.

Mr. Longden said :—In dealing with the subject I have chosen for to-night's paper, I wish to restrict the metals of which I shall treat by omitting gold and silver, as, though they have been used decoratively, as in the Pala d'Oro at St. Mark's, in Venice, and various shrines of gold and silver which have perished, such as St. Cuthbert's, in Durham ; St. Albans, in St. Albans Abbey ; St. Thomas's, in Canterbury ; and St. Edward's, in Westminster Abbey, their use has not been extensive, compared with the use of other metals, and I have no experience of this.

The use of metal work in decoration, both as fixed in buildings and in useful movable articles, is most ancient, and we have records of the use of bronze very extensively in Ancient Greece and Rome. In the total destruction of the civilisation of the Ancient World the bronze so used was mostly melted, and we have few remains of it. This is much to be regretted, as, except gold, this is the most enduring metal, and is susceptible of the finest work which the modeller or sculptor can bestow upon it, besides being capable of treatment by the chaser's art. It has the great virtue of tenacity, so that cast work in this metal may have thick and thin places, such as cast iron, and, to some extent, cast brass, will not allow without cracking. By the process of "coring," by which is meant making the casting hollow by putting inside the sand mould a reduced and generalised copy of the figure, vase, candelabrum, capital of a column, or whatever may be the subject of the casting, leaving a thin space between the "core," or reduced copy of the article, and the outer envelope of sand, called the sand mould, the whole casting may be made of about equal thickness all over, so using less metal and saving expense, which is an object not to be lost sight of, besides other advantages. Some very fine examples of bronze work are shown among the drawings ; the statue of Colleoni, by Verocchio, is by that great man who was architect, sculptor, bronze-founder and finisher (which in those times were the same thing), and painter. The band of bronze ornament round the pedestal shows what might be done by sculptors now if they called in architects to help them with the pedestals of their statues. Another example is an interesting triangular pedestal for a statue, with a band near the top and another near the base, of bronze. This is all Italian work.

The best example I can refer to of this work in England is the gates and the enclosure of the tomb of Henry VII.'s Chapel in Westminster Abbey.

The construction of the great gates of the chapel is curious. There has been made a frame of wood forming large squares which is covered at the front and back with cast bronze mouldings, and the interiors of these squares, so to speak, are made of thin open-work castings, with devices of the rose, portcullis, &c., suitable to the place and founder. The screen round the tomb is differently made, not having the wood internal construction, and the gates of the screen are made of bronze castings only, ingeniously fitted together, as it was evidently not convenient to make very large castings. The work on the tomb is very fine, and shows the change in style from the latest Gothic in the gates and screens to the Renaissance in the tomb in a most interesting way. There is some other fine bronze work in the Abbey, but I must not dwell upon it.

I do not attempt to speak of bronze statue founding, as that is a subject in itself. Mr. Simonds, the sculptor, lately read a learned and instructive paper upon this subject before another society, and it requires some one with skill such as his, which I do not possess, to treat this subject. I wish to plead for the use of this metal more in architectural work. I have seen it used with marble in recent work with the happiest effect. It is a metal which is beautiful if left in its own golden tone, and which in changing from this tone never becomes ugly. It will take gilding perfectly, and will take various patinas, the green, the brown, the black, and, when used with marble of fine contrasting colours, produces effects which cannot be had so well in any other way. It lends itself best to decoration of the finest and most monumental work, and, if the tendency to greater refinement in style which I seem to observe in the works of the best architects continues, I have no doubt that this metal, with

its mellow and grave tones, will be more used and valued. Our neighbours the French have been skilled in the use of this metal for many years; indeed, they may be said never to have ceased using it since the time of Cellini. We have scarcely used bronze for many years, but there is no reason why we should not, and there is every reason why we should, I venture to think. I am happy to say that in our great cathedral, St. Paul's, in this city, some bronze work gilded is to be used in the new reredos which is being put up, and I hope this will only be the prelude to the more extensive use of this metal for which I have pleaded.

Brass is a metal for which no pleading is necessary. It has been adopted very widely in the last thirty years. I can remember when brass was thought rather vulgar. It was used for door and other knobs, for very every-day candlesticks, window-fastenings, and things little thought of. Among the many changes made by Pugin, whose name must ever be honoured by us, it was discovered that brass was a metal which had a beauty of its own, and that it could be applied in many ways to decoration in public buildings, churches, and houses. We have all seen the "Mediæval gas-fittings" which, if they became painful and at last almost odious, began in the fine work of Pugin, and, as he used the metal, were beautiful and useful. At the same time I must confess that the feeling of softness which the special smoothness and polish which brass will take seems to me to call for in design, was not so thoroughly studied when it was first reintroduced among us as it ought to have been. I have the pleasure of showing you some examples of this metal in very happy treatment, some of them kindly lent to me and some belonging to myself. As exemplifying the great beauty of softness and rounded contours with great delicacy in curves and the very fine detail, some of it almost imperceptible, which the skilled turner knows how to give to his work, I have here a thick low candlestick, probably Dutch, which is one of the finest examples of this kind of work I have seen. A small candlestick here, too, of a not uncommon Dutch type, but very good in its profiles, is a good example of the softness. The Italian candlestick shows fine contours, and turning with bold chasing of a good Renaissance type, and an interesting tripod foot, with the arms of the donor or owner of it let in in silver. Two brass dishes here are examples, one of Venetian engraved work, full of subjects, and the other of hammered raised work, showing a coat of arms, with mantling, probably of German work. The Persian jug has fine form, and delicate engraving covering the jug with diaper. The handle of a serpent is well designed. The brass fire-irons of old Dutch make are in bold Renaissance style, and the warming-pan and the simple English brass dog of a very traditional form, applied both to iron and brass, with variations suitable to the material, show various uses for brass, all good and characteristic.

The double-branched candlestick is a good example of what I take to be Flemish beaten work. It cleverly treats a design which almost suggests solid cast work, without attempting what sheet brass will not do, and it has an advantage in its lightness for its purpose of hanging on a wall. The oval basin or dish is good Italian work, and it excels in the specially Italian way of getting good effects with broad and simple means. The brass plate, with a figure of William of Orange, is Dutch work, and dates itself 1696. It has a bust of William, with the orange branches, and Fame blowing her trumpet over his head. The form of it is like that of the firebacks in cast iron, which were put behind the wood-fires down upon the hearths, and my idea is that the Dutch housewife, who was very patriotic and very tidy (two great Dutch characteristics), had this made to cover up the iron fire-back in the summer when no fire was wanted, and it would look very resplendent, as you may see, when standing down on the hearth of a wide, open, and lofty fireplace, and surrounded with clean, fresh-looking Dutch tiles in a spotless room.

I have not much here to show the brass balustrades, which are a special feature in screens to choirs and chapels in churches in Belgium and Holland. They have a very rich and beautiful effect, whether used with wood or with marble, and they agree well with buildings and fittings of the fifteenth century, or any later style. A modern example of this is in the chapel of Castle Howard, where an oak screen has a balustrade and panels of brass work in it, and the effect is sumptuous. Mr. Norman Shaw has used a brass balustrade in a house in Cheshire as part of a screen between a saloon and a corridor, with shutters behind the balustrade, so that the screen may be an open or a closed one at will. At Hal, in Belgium, where is a very interesting church, there are a brass font and lectern of very good fifteenth-century work. There are casts of these in the South Kensington Museum. The lecterns in brass are so common that I should not name them further, but that I wish to mention that in King's College Chapel, in Cambridge, which is exceptionally fine; and that the candlesticks in brass, of great height, which Mr. Gilbert Scott designed, and Mr. Barkentin made within the last twenty years, are in perfect agreement with the style of the lectern, and are, I make bold to say, quite as fine as the old work in both design and execution. In Germany the Lutherans spared much of the work in the churches which was destroyed in Holland and in England, and in St. Mary's, Lubeck, there is a brass sacrament house on the north side of the high altar of the most elaborate fifteenth-century work, with a spire—the whole thing being about 25 feet high, if I remember rightly.

The monumental brasses in some of the German churches of the fifteenth century are very fine. They are not simply engraved and filled in with black or colours, or with the ground left in strong hatching, but they are modelled in low relief, and are well chased and finished with a dull polish. Such brasses as these let into walls, not into floors, are, unless they are torn away in some revolution, more enduring than marble or stone, and are capable, either as cast and chased work, or as work hammered out of plate, of being made very handsome memorials. I have seen some of these lately in which brass, or brass and copper, have been used with marble as wall tablets with excellent effect. I cannot plead for the use of brass very extensively in town churches where there is smoke in the air, and often chemical vapours too, as the colour of the brass goes and it turns absolutely black, especially in cheap common things, which are made of inferior brass; but in country places, and where the rubbing of the brass is not considered too troublesome, I would plead for its being used in the various ways I have described, as the more it is rubbed the better it looks, and the satiny polish of old, well-rubbed work is specially delightful. In work connected with the household there is no need to say a word for brass. It is now used most extensively, almost too extensively, about fireplaces, in arrangements for lighting, whether by gas, electricity, or by candles or lamps—in grilles, in dishes, in ornaments, and even in such things as flower-pots and jardinières, where the use of it becomes meaningless. It has almost come to this, that if you look into many windows where household articles are shown you are repelled by the gaudy display of polished brass everywhere, and you are tempted by this extravagant over-use of what is a good and useful thing in moderation to forswear the use of it. It is the bane of everything in these days of "fashion" that a thing, pretty and good in itself, is seized upon after it has been introduced and used for a time with reticence and good taste, and everybody must have this good thing everywhere until one becomes tired of seeing it, and almost wishes it were banished from use. I fear lest the use of brass should be passing through this phase now, but it will always have its special use and beauty if care and good taste are exercised in the application of it.

Copper is a metal too soft to use very much in decoration, but it has a fine colour; and used in mixture with brass (with which it has a natural affinity in colour, being the mother-metal, so to speak) it enriches the composition. If the main structure of anything be in brass, and the copper be applied in inlay, in incrustation, in bands, or in many other ways, an admirable effect may be had. Mr. Benson has lately made lamps and many household things, in which this mixture of metals is treated with great originality of design. I have here an old tinned copper bowl of Persian work, which has good engraving upon it, and is of a good form. I do not know the use of this; but the ornament is quite characteristically Persian, and it is a good example of engraving where the ground is cut away and the pattern is left.

Steel was much used in the latter part of the eighteenth century, when the metal had newly come into general manufacture. It has rather a cold and severe tone, but in things which can be cleaned it may be used with excellent effect in a room. I have here a fine example of the work of the end of the eighteenth century in an old grate which is made of steel, engraved and enriched with bosses and beading of the refined kind which began to be used about that time. I find that our English work of this time was better than in any country in steel.

We now come to iron, the metal which is most used in decorative metal work. Cast iron has not the same qualities of tenacity as wrought iron; but there are many good qualities of this metal, and for resisting fire in fireplaces good strong cast iron is the best. I have seen castings of iron called "rolls," for rolling steel, which, by careful selection of metals, and a special mode of melting, were so strong that a shaving has been turned in a lathe from one of these rolls (say 2 feet in diameter), which shaving was long and curling (say 1 foot long) when measured in its spiral form, not straightened out, and it could be pulled out and would return to its shape like a steel spring. This was, of course, quite an exceptional quality of cast iron, but it shows what that metal may be. I can remember the time when wrought-iron ornamental work was not thought of; everything was made of cast iron, and very badly made too, as design, but that need not be so. I have a small plate here of a design by Alexander Thomson (called Greek Thomson), of Glasgow, which shows what may be done in a railing in this material; and Mr. Butterfield has shown in the screen which closes the court of All Saints Church, Margaret Street how a

master can treat this metal. The quality of breadth of design can be got by cast work better than by wrought work (this applies to bronze as well as to cast iron), and in the screen I have mentioned Mr. Butterfield has done what he could only have done in cast metal. Mr. Philip Webb has treated cast iron in an original way too, covering it with fine delicate ornament, so arranged that it does not become monotonous, and yet is an enriching of the surface which cast work will specially allow.

The old backs of fireplaces which I have named before are good examples of the right use of cast iron. I have here the finest I have seen of its type, the back, which I will call the trophy back, from the trophies of arms upon it. This has what I believe to be the lion of Flanders on a shield, and dates itself by style as of the sixteenth century. The back of the *Woman of Samaria* is interesting from the costume and architecture. Our Lord sits on one side of the well of Samaria with His disciples behind Him, and the woman of Samaria stands on the other side listening to Him, with her friends and neighbours trooping out of the gate of the city. The well is of a fine early Renaissance type, with sculptured stone margin, and a canopy over it with tiled roof, into which the bucket rises. The brass water-pot is of fine design. The towers of Samaria are in the distance. The Fairfax back is, of course, English, and I believe it is a Sussex back. It belongs to the time of the Commonwealth, and is of a shape commoner in England than abroad. There are very fine backs of a later date in Sir Christopher Wren's part of Hampton Court Palace, and in the Hôtel de Cluny in Paris there are good French ones. The design of these, about the time of Francis I. and Henry II. of France, was perfectly fine. They are larger and higher than the English backs usually were. The cast-iron fire-dogs which one may still find in Surrey, mostly broken, I fear, are very interesting. The dog I have here I take to be from an old French one, but I am not confident about this. It has a good, sturdy, cast-iron character, and succeeds in getting as much variety of shape and surface as can be expected in a material like this, while it is remembered that it must be exposed to many blows, and these often when the dog is heated, and would therefore crack the more readily under a blow.

Wrought iron, which has special qualities of strength, tenacity, durability, and relative cheapness, is coming more and more into use daily. For some time, as I have said, it fell out of use, but the Gothic movement in England brought wrought iron into vogue again, and after the use of it being almost confined to ecclesiastical work in hinges and screens, it has now come into houses. Outside railings, grilles to protect windows and fanlights, knockers, door-handles, internal grilles to cover pipes, dogs, fenders, and iron fittings for lights are made in wrought-iron. There is some reason to fear in this, as in the case of brass, fashion may overdo a good thing, but the extravagant use of iron cannot be gaudy at least. Polished iron is not suitable for use in our damp climate, or I should recommend this, as the fine grey polish which it will take is very harmonious with rooms which are furnished richly. When labour can be found without too much inconvenience, polished iron should certainly be used. For external work black or painted wrought iron must be used. I fear that the manufacture of iron now is not favourable to such durability as some of the specimens I have here shown. The old mode of smelting with charcoal made a finer, closer, and more ductile iron, less liable to rust than the modern iron. Perhaps, also, the atmosphere in our great cities and towns was not so unfavourable to the duration of wrought-iron work. In making fine wrought-iron work, it is important that the best iron now obtainable be used; indeed, when the work is intricate and needs many welds, none but good iron can produce the effects aimed at.

I have been favoured with drawings of iron work from Italy and from England principally. The French have been very clever smiths always, and there is a little of their work shown in sketches from St. Maclou at Rouen. They have in this, as in nearly everything else of an artistic or ideal kind, carried their boldness to the extent of temerity. Their iron work of Louis XIV.'s time is very stately, rich, and well balanced in design, with firm leading lines and graceful foliage and garlands. In Louis XV.'s time the curves became bolder and looser, as in all art of that time, and anyone who has seen the Grande Place of Nancy, which was built in this reign, will not forget the wonderful profusion and richness of the iron screens which come in, I think, eight times in the regular composition of buildings and screens. In Louis XVI.'s time the work became elegant and rather stiff, and soon the fine iron work died out. The German work is comparatively clumsy, and the endless scrolls with sprays going out at strange tangents, and passing through the scrolls in gratuitously difficult ways, the scrolls ending in flowers of the shape of silkworm cocoons, and with antennæ springing from them so as to remind one of great insects, which seem among the most characteristic Mediæval German work, are not very beautiful, if they are very clever from the ironworker's point of view. In later times the iron work throughout Europe seems to have been greatly affected by the French taste of the time. There are great quantities of fine rococo iron work in Vienna, I believe, and I have seen in Zurich a house with extremely good balconies and balustrades in this style.

In England we have always had rather a different way of doing work to that of other countries, even when the same wave of feeling as to style passed over us. The very noble screen of Huntington Shaw, which we have preserved from Hampton Court, in the South Kensington Museum, is different from any other work, though it has its points of resemblance with French iron work. This and the gates and grilles in St. Paul's are some of our best iron work in England. I have here some sketches from the Hampton Court screens, and I think this kind of work is very much to be studied and followed by us. The construction is good, and the ornament is so applied as to enrich the construction without hiding it, and to make a good composition of open and solid work, well contrasted and varied in the screens almost infinitely. There is a largeness of style in these screens and in the St. Paul's work which must have been impressed on it by Sir Christopher Wren, who was such a great architect and engineer, and who impressed his feeling of grand style on all the people who worked for him. The later English work, of which I have a small example here (a bracket), and some interesting drawings, is simple and direct in style. One example from the Adelphi, which is now taken away, has a very good contrast of free and rigid lines, and I have noticed in the recent work of many of our architects that the best characteristics of the old examples have been followed.

I have here some good pieces of iron work also. The churchyard cross comes (as far as I am concerned) from Basle, and was, doubtless, taken from some neighbouring churchyard. It seems to be a piece of work of the middle of last century, but the date has been partly obliterated. There is a small crucifix painted on the back of the box, of which some traces remain. The freedom and luxuriance of the iron work go quite as far as such qualities may reasonably go, I think. The projecting hook is to hang either a lamp or a holy-water pot upon.

The grille is a fine piece of lattice work, and the finishing of the cross bars with roses on the frame is very pretty and simple. This has evidently been a door to an aumbrey, and has had two locks, so that something precious was kept behind it. The panel of scroll work is a good example of pure smith's work in getting ornament out of the flat bar, and then returning to the flat bar shape. The *landier*, as the French call it, is good as smith's work, and is an illustration of how meat could be roasted before a wood fire, and small stew pans could be heated on braziers of charcoal in the small dishes on the swinging arms of the *landier*. The old English iron dog, of great simplicity of style, has a dish at the top for the same purpose, and is prepared with hooks for spits to rest on. On the board are good examples of a knocker, a handle, some flowers, and some scrolls of rococo work, with very clever treatment of thin iron foliage. The two Italian dogs of iron and brass have good points in regard of the treatment of both metals. There is on the board a naïve and interesting piece of engraved work on polished iron sheet, with the openings cut out very irregularly with a chisel after the engraving has been done. The lock and key of Louis XIV. style are very good. The two high wrought-iron candlesticks and the gridiron are pieces of old work, showing how interesting a thing, made almost without design, may be made by the workman setting about in a simple direct way to his work. There are many fine drawings here from Italian iron work. The screens at Orvieto, which have in the finials some of the best work in the naturalistic way that exists, I believe. There are also other screens, fireirons, brackets, and well work, all of that surpassing beauty which Italian work had until recently, and which they have now quite lost apparently.

In a paper like this I am only able to touch the fringe of so large a subject as the decorative use of metal work, but I have slightly described some uses of the metals most used in connection with buildings. I have endeavoured to speak as much as possible only of what I have seen and known myself, and to illustrate my paper by actual examples.

It has been my great pleasure and privilege to witness much of the great revival in architecture, and I may say all of the revival in the arts as applied to architecture. I saw the Exhibition of 1851, and though I was too young to be able to understand the difference between our design and that of other countries—and, let it be remembered, no country then exhibited very fine decorative work—yet I know that at that time gasfittings made in imitation of convolvulus, with thin stamped brass leaves and opaque white glass flowers, out of which the gas-pipe came, were thought elegant, and that these things would now be scouted. I do not mean to say that I think the general level of taste is high, but it is better than it was then. In that Exhibition some work directed by Pugin was shown, and from that Exhibition we began to learn that the state of things in England as regards design might be improved. Many

currents have run towards the improvement. Among these are the increased study of all kinds of old work by architects and craftsmen, the direction of work by Pugin, by Alfred Stevens, by Godfrey Sykes, and by numerous living architects and designers. The teaching of drawing now so widely diffused, and, in consequence, the new spirit that is put into work by the men who execute it, are such things as I scarcely could have expected to see. Let it be always remembered that the same people, as to race, live in these islands as those who did some of the beautiful work which we have collected here, and of which we have drawings here. There is no reason why these men now living amongst us should not do work as good as the old men did. There is skill and patience and dexterity in our own people, and as we need not be ashamed to compare English work from the twelfth to the eighteenth century with work of other countries, so I am convinced, and that by experience, we need not be ashamed to compare that of the nineteenth century. The design, by whoever made, must be suitable to the material, and I will answer for it that there are people now who will carry it out in metal work in the spirit of the design. We may leave our record for future times in these accessories of architecture, as we shall in architecture, that there were good men now, who studied their work, took account of modern conditions and requirements, and, at the same time, studied how to treat the new things in the spirit of art, of loving study, and patient endeavour which characterised the work of former times.

The PRESIDENT said they would all share his regret that the paper was not longer. Mr. Longdin, from personal experience, was well qualified to speak on the subject, and, moreover, the numerous examples he had brought to show them were equally instructive with his paper. They saw the way in which metal should be treated, and that good effect could only be got by a treatment harmonious to a particular metal, a principle which was becoming now more and more recognised, instead of as formerly adopting a treatment foreign to the nature of the metal. Speaking of iron work, more especially cast-iron work, many examples of singular beauty, dating from the end of last century existed. A stove at Knowle House, perhaps, was more of an example of ornament than of use, but the casting showed a work of extreme excellence and delicacy. One objection to cast work was that you might see miles of it; and though you had most beautiful work, your neighbour might have exactly the same, and that took away from the individuality in design which all art ought to have. At another place, in Northamptonshire, there was such an abundance of wrought iron in railings, palisades, gates, &c., about the grounds, that the estimate for repair alone amounted to 800*l*. The President concluded by referring to an example in Lisieux, in Normandy, of a spit worked by weights on fire-dogs, still in use, and also to the beautiful gates at Carshalton, which had never yet been figured. They were well worthy of it, and he hoped some of their members would find time to do so.

Mr. J. D. SEDDING, who proposed a vote of thanks to Mr. Longdin, called attention to the presence of Mr. Krall by his side. He also admired the programme of lectures for the present session as being the opening of a new vein of practical subjects.

Mr. SHUFFREY seconded the vote of thanks, and inquired whether the metal plaques were made from wood or clay models.

Mr. KRALL referred to gratings or door panels, which were now being frequently used.

Mr. FELLOWS PRYNNE considered that iron work was one of the most difficult things architects had to deal with. In its natural state it was most beautiful, but that was often lost in the grey of the distance. Whether it were right to apply colour to iron in imitation of brass or other metal work he would not venture to say.

Mr. J. M. MACLAREN said redundancy of design should be avoided in iron work. Skilful treatment was wanted in spacing out and filling in the detail, whereas want of scale was often too noticeable in modern work; the result was pettifogging, and denoted the absence of any guiding principle in the design.

Mr. W. H. PRATT observed that a peculiarly pleasing effect was to be seen in one of the old Sussex towns, where hardly a lamp post was to be seen, bracket lamps being used instead.

Mr. LEONARD STOKES referred to the well-designed lamp standards on the Thames Embankment, to old church-door hinges, and an ancient candelabrum at a church of St. Nicholas, Thanet.

Mr. MAX CLARK and another member also spoke.

The vote of thanks was then passed by acclamation.

Mr. LONGDEN, replying, said that he had been trained as a founder, and naturally might be supposed to have his ideas about iron work. No doubt some architects might think there was a difficulty in applying design to iron work, and one indeed had said he would as soon be asked to design in melted butter as in iron. He agreed that Mr. Sellars, of Glasgow, was a magnificent designer of the greatest fertility and comprehension both in cast and wrought-iron work. Lately Mr. Sellars also had turned his hand to terra-cotta, the results showing extraordinary skill and elegance. Speaking as a founder, he would say that cast iron was capable of receiving most beautiful decoration; if it was ugly it was not the fault of the material but of the designer. The stove at Knowle was a monumental work, but it was covered with a mass of beautiful and delicate ornament. Iron when gilded did not become an imitation of brass or other metals. Speaking of the endurance of iron, he pointed to an example one hundred years old, and said if one wished it to last one must insist on having iron of the very best. The use of gilding bronze was this, that the gilding, which was dead, brought out the chasing on bronze. In no other way could the exceedingly fine chasing be seen. As to patterns for plaques, he had never seen any models; but they were often made from wax or plaster models, which were destroyed or perished as soon as they had served their purpose.

Bygones.

"*Antiquity after a time has the grace of novelty.*"—HAZLITT.

THE GOLD MEDAL OF THE INSTITUTE.

THE announcement at the last meeting of the Royal Institute of British Architects of an opportunity to nominate candidates for the Gold Medal recalls the origin of that reward. Since 1848 the well-known form of notification has been in use, according to which the medal "is annually conferred on such distinguished architect or man of science, of any country, as may have designed or executed a building of high merit, or produced a work tending to promote or facilitate the knowledge of architecture, or the various branches of science connected therewith." But the object for which the medal was originally granted could not be described in that way.

The earliest public announcement of a Royal Medal for the encouragement of architecture was in 1846. There can be no doubt that what Earl de Grey sought when he undertook the negotiations was a reward for a competition among the junior members of the profession or students, and among them alone. This fact is evident from the following instructions for the first competition, which were issued by the Council of the Institute:—

Her Majesty the Queen having been graciously pleased to grant to the Institute an annual medal for the promotion of architecture, it has been resolved that it shall be applied to the encouragement of the junior members of the profession by a competition in designs, composed in a style calculated to promote the study of Grecian, Roman, and Italian architecture, and further, that the designs shall be judged of, not only with reference to their merits as works of art, but likewise as to the knowledge of construction they may exhibit.

In order to secure, as far as possible, uniformity in the conditions under which the designs are submitted in competition for the Royal Medal, it has been determined that the age of the competitor shall be limited to twenty-five years, and that with this limitation the competition shall be open to the profession in general.

The successful competitor will be further entitled to draw upon the treasurer of the Institute for the sum of 50*l*. after his arrival in Rome in the pursuit of his professional studies, at any period within five years from the time of the medal having been awarded to him, upon sending to the Institute a satisfactory study of some existing building, either ancient or modern.

The Royal Gold Medal for the year 1846 will be awarded to the best design for a building suitable to the purposes of the Royal Institute of British Architects, comprising a room for general meetings and lectures, with seats for 350 persons, arranged with a view to the reading of papers, the exhibition of drawings and diagrams explanatory thereof, and for facility of discussion; a council-room for 25 members; a library for 10,000 volumes, with suitable depositories for drawings, prints, medals, &c.; a gallery for models, casts, fragments, &c.; an exhibition-room for architectural subjects, and suitable residences for a secretary and a curator.

The cost of the building not to exceed 20,000*l*.

The design to comprise not less than one plan of each storey—two elevations, two sections, and a perspective view.

The scale of the drawings to be one-eighth of an inch to the foot, and to be tinted with Indian ink or sepia only.

The Council will not consider themselves called upon to adjudge the medal, unless the designs and drawings be of sufficient merit to deserve that distinction.

It will be seen that the competitors were not restricted to the junior members of the Institute, for the contest was "open to the profession in general." Although here were no limitations,

and a junior member in Glasgow, Dublin, or Bristol could compete, only eleven designs were received. It is now impossible to describe their character. The test that was applied by the Council was the practical one of cost, and as is not uncommon in such cases, none of the designs could sustain it. They were all incontinently rejected. It was not in respect of artistic merit or planning that the competition became a fiasco. The following report was issued to explain the action of the Council :—

In detailing minutely the accommodation to be provided in the building to render it suitable for the purposes specified, and by fixing a limit to the proposed expenditure, it was obviously intended by the Institute to impress the candidates with a feeling that in forming their designs they were expected to treat the subject practically, and direct their efforts to the production of a design adapted to the requirements of an existing working Institution.

They observe, with much regret, that the well-considered and clearly-expressed conditions of the Institute have been almost entirely disregarded, and that in consequence of the uncalled-for magnitude of the rooms, halls, staircases, and other approaches, together with the lavish and injudicious introduction of columnar and other extraneous decoration (in some instances actually unfitting the rooms for the purposes demanded), not more than one of the designs possessing the slightest pretension to consideration as an architectural composition, could be properly executed for less than double the sum specified.

When the Council reflect on the enormous amount of injury occasioned to the public and to the profession, from competitors so frequently disregarding the conditions given with respect to the proposed expense of an intended structure, and consequently presenting designs of much higher pretension than could be produced with an honest and conscientious adherence thereto; and when they likewise reflect on the strong reprobation the Institute has had occasion more than once to express on this most irregular and improper practice, they feel that it would ill become the Council to recommend to their fellow members of the Institute to countenance such dereliction from honourable professional practice, even in a competition like the present one, where the public interests are not directly affected. The fact being so apparent entirely precludes the Council from recommending to the members of the Institute the awarding of the Royal Medal to either of the designs presented this year.

They regret to be compelled, on grounds which they consider too important to be disregarded, to come to this decision, especially on the first occasion of a competition for so high a distinction as the Royal Medal, and the more so since the design marked "Quanto rectius hic qui nil molitur inepte" possesses a high degree of merit, and displays much taste and artistic talent.

The concluding words of the third paragraph suggest that if the Council withheld the Gold Medal in 1847 they hoped to be able to bestow it in the year following. There is nothing implied in the report about the Council having a desire to use the Royal Gift for a very different purpose. However, in the course of the year it was considered advisable to utilise the medal for the distinction to which it is now applied. It was announced afterwards that the Council of the Institute were prepared to receive nominations and foreigners were as eligible as natives.

The names of eight foreign and eight English architects were submitted, and after considering the claims of the candidates it was found that most votes were given for Professor Cockerell, R.A., and the medal was rightly awarded to him in testimony of his distinguished merits as an architect. The decision was given in February, but as the dies of the medal were not prepared the medal was not presented to the professor until the opening meeting of the following session, on November 20, 1848.

Correspondence

Colour in External Architectural Construction.

SIR,—In my letter of December 24 on this subject, I said nothing of the examples furnished by the imperial city of Rome—the source of all modern architecture: good, bad, and indifferent. Altogether, I find, upon a not very diligent reference to modern authorities, no less than sixty-two notices of the application of fifteen different sorts of coloured marbles, porphyries, granites, serpentines, and diorites.

Agrippa's portico of the Pantheon has its front rank of eight columns of grey, and its rear ranks of red granite, with capitals and bases of white marble. The walls of the great rotunda behind are adorned with yellow Numidian and green Karystian. Its pavement with porphyry, granite, and different marbles. The columns of the Temple of Antoninus and Faustina are of pavonazetta (banded layers of blue, grey, and green alternating with white). The arch of S. Severus is enriched with Proconnesian green marble. In Trajan's Forum an abundance of yellow Numidian and red Egyptian syenite was used, and the beautiful Pentellic white marble of the Flavian palace was heightened in effect by the liberal use of giallo-antico, cippolino, green diorite, and with Phengite marble, said to have had the property of reflecting like a mirror. Specimens of all the marbles may be seen in the little museum in the Farnese Gardens.

In conclusion, I need only remark that in Mediæval Rome the love of colour in architectural details was as strong as in Classical times. Popes and princes converted the noblest remains of antiquity into quarries for the supply of the choicest materials of their palaces and churches. The numerous examples of the use of coloured materials in the external architecture of different countries seem to me to urge one lesson upon future designers, viz., that colour should be conspicuous in every façade. I have already shown that within the limits of the United Kingdom the most splendid and everlasting materials exist for this purpose.

Yours obediently,
T.

NEW BUILDINGS.

Innholders' Hall.—This hall, which was erected after the great fire of London, of late years fell into a dangerous condition, and the court adopted the recommendation of the architect to preserve the old court-room and the livery hall, the parts having most interest, and to rebuild the remainder of the premises. The old doorway in Little College Street, E.C., is reproduced in moulded brick, and the old door and frame, with canopy and arms, refixed. The entrance hall, which is panelled in oak, has an angle fireplace, and an ornamental oak screen to the staircase. On the right is the old court-room, which is unaltered. The paint from the wainscoting has been removed. A new panelled ceiling has been placed in the livery hall. The ugly window at the west end has been improved in appearance by pilasters, dividing it into three lights with trusses supporting the head. Under this window is an oak buffet, with silvered panelled back and carved head, with a pediment in the centre, surmounted by a figure of St. Julian, the patron of the company. The other windows have been improved in appearance, and filled with ornamental glass. The minstrels' gallery in the angle is retained, and an entrance formed direct from the staircase. The screen across the hall is also removed, and a part of the space under the gallery enclosed to form a lobby to the serving-room. On the north side of the entrance hall lavatory accommodation is provided, and an oak staircase at the back of the screen gives access to the upper floors. On the first floor, at the top of the stairs, is a small anteroom, with a carved chimneypiece, executed in deal, removed from one of the houses adjoining; also a strong room for deeds and plate. A new court-room is planned on this floor over the old court-room, with an elaborate modelled ceiling, effectually decorated. The walls have a panelled dado, and these, with the fittings, are in American walnut; also an ornamental wood chimneypiece, surmounted by the arms of the company. The upper floor contains some excellent rooms as a residence for the beadle. The basement is devoted to the cooking department. The works have been executed by Messrs. Brass & Son, and the gasfittings by Messrs. Strode, of St. Paul's Churchyard. The whole has been executed from the designs and under the immediate superintendence of the architect, Mr. J. Douglass Mathews.

Silloth.—The new mill for Messrs. Carr & Co., of Silloth has been erected from the plans of Mr. T. Taylor Scott, architect, of Carlisle, by Messrs. Beaty Bros., builders, Carlisle. The buildings are fireproof, every portion, down to the smallest detail, being of incombustible materials. The walls are of a specially hard brick, manufactured by the Birkby Brick Company, near Maryport, and were tested before use by one of Tangye's hydraulic machines to stand a crushing strain of over seventy tons to the superficial foot. The fireproof floor and roofs, which have been carried out by Messrs. Homan & Rodgers, engineers, Dawson Street, Manchester, are formed with their patent section rolled iron girders and joists, manufactured at their Belgian works, and filled in, on the flat-arch system, with concrete of a special kind. The surfaces are faced in quartz finish, and the roofs are laid with Seyssel rock asphalte obtained from France. The floors have been tested with a compact dead-weight of 32 tons to an area of 162 feet. The ceilings have been done by the same contractors with Robinson's patent cement. The large engine bed, of special construction as regards strength, has also been made in

concrete, finished with quartz, by Messrs. Homan & Rodgers, and weighs 260 tons. The contract for all the iron work has been carried out by Messrs. Cairns & Co., and Messrs. Tweedy & Co., of Carlisle. All the windows are constructed with Lindsey's patent wrought-iron sashes, and are of malleable iron with stamped boss intersections, and hinged to run between side keepers with enclosed cord. The doors are of strong plate iron strengthened with cross rolled ribs, and hung to run on specially constructed rollers and heads. A large fireproof iron staircase and three fireproof gangways connect the mill and the warehouse on every floor for the required communication between them. A strong iron roof nearly 40 feet span, designed by the architect to suit the numerous iron worms over the silo bins, has been erected at a height of 56 feet above the ground by the same firm, and covered with Vieille Montagne zinc Italian rolls supplied by Messrs. Braby, of Liverpool. The engine and electric light houses, 50 feet by 35 feet, are adjoining buildings to the front, and are very elaborately decorated with glazed bricks and Burmantofts faience ware, manufactured by Messrs. Wilcocks & Co., of Leeds. The engines are compound and of 300 horse-power, being manufactured by Messrs. Douglas & Grant, Kirkaldy.

London.—A billiard-room for the Constitutional Club, Poplar, is in course of erection, from the designs of Mr. Brett A. Elphicke, of 7 Great Queen Street, Westminster, and Tunbridge Wells. The room will be 42 feet in length by 20 feet wide, and will be lighted by a leaded lantern over each table. Mr. Riddle, of Poplar, has been entrusted with the execution of the work.

London.—The newly-constructed wash-houses in connection with the St. Marylebone Baths, in the Marylebone Road, have been reopened. Mr. J. Waldram, C.E., of Craven Street, Charing Cross, designed the new buildings, and superintended the construction. In the basement is a new main room, where the various mains, also new, are painted of different colours, according to their uses, the manipulation of them being thus rendered more easy and certain. Also in the basement are four boilers for supplying water and steam, a new engine of 6 horse-power nominal, for driving the machinery, and furnaces to heat the drying closets. Over the basement is a fireproof roof, on which rests the floor of the laundry, which is paved with slates, and adequately supplied with drainage, so that it cannot be sloppy. The laundry is of the same size as before, but the roof, now of iron and glass, has been carried to a height of 30 feet, and is well ventilated.

Whitby.—The memorial-stones of a Temperance hall have been laid. The hall will be Renaissance in style, and will seat about 1,100 people. The cost is estimated at about 3,000*l.* Mr. R. Lennard is the architect, and Mr. J. Gladstone the builder.

Walsall.—The new church-house for St. Matthew's, Walsall, has been opened. Ample means are provided for heating and ventilation, and attached to the building is a caretaker's house, with suitable offices. The architect is Mr. James Davis, Walsall, and the builder, Mr. T. Taylor, Hall Lane, Walsall.

CHURCH BUILDING AND RESTORATION.

Birkdale.—The church of St. James has been reopened after considerable enlargement by the addition of new transepts, and improvement of the heating and ventilating system, along with general repairs and decoration of the interior, carried out from the designs of Mr. J. Francis Doyle, of Liverpool and Birkdale. The contractors were, for the building, Mr. Wilkinson, of Southport; masonry, Mr. Luke Rimmer; slating and plastering, Messrs. Tanner & Sons; plumbing, Mr. Lawton; lead waste heads, Mr. S. R. Henshaw; heating, Messrs. J. R. Cooper & Sons, of Liverpool. Mr. Reuben Bennett, of Manchester, did the decoration; Messrs. Jones & Willis provided the upholstery and fittings; Messrs. Freeman & Collier, of Manchester, coronæ for transepts. Mr. Richard Routledge acted as clerk of works.

Haughton.—The church of St. Giles, an edifice originally built of rough stone with a campanile and oriel windows, part of which still remain, is to be restored. The present tower and side chapel were built in 1527. The windows on the north side are all Tudor, and the rest of the church was probably built at that period. Mr. J. L. Pearson, R.A., is the architect.

Alrewas.—The completion of the restoration of the tower of Alrewas Church has just been celebrated. The work has been carried out under the direction of Mr. Basil Champneys, architect, by Messrs. Lowe & Son, Burton; Mr. Stephen Kemp acting as clerk of works. New pinnacles were supplied by Mr. R. Bridgeman, of Lichfield.

M. Alfred André has completed the restoration of the celebrated coffer in the Escurial, which dates from the sixteenth century.

ARCHÆOLOGY.

Mediæval Episcopal Costume.—The German papers give an account of the discovery, in the cathedral of Worms, of the body of a Mediæval bishop, who has been identified as Conrad de Sternberg, who died in 1154, being a contemporary of our Henry II., and of the great German Emperor Frederick Barbarossa. During the progress of some restorations which are being carried out in the cathedral, a stone coffin was found deep under the floor of the choir. It was closely cemented, and on its being opened in presence of a special commission, the body was found in perfect preservation, and arrayed in vestments denoting episcopal rank. On the head is a low mitre, the lower border of which is formed by a band of thick gold embroidery, of a lozenge-shaped pattern; the fillets of the mitre are composed of the same sort of work, with deep, heavy gold fringes. The peaks of the mitre have their edges adorned by similar embroidery. The alb and amice are made of thin linen, very openly woven. The chasuble, of the old bell shape, is made of very thick twilled silk, and falls in long folds around the body, forming a sort of pad round the neck. In the usual way, a richly-embroidered band runs perpendicularly down the front; it has no special design. The edges of the chasuble are simply hemmed. The tunics under the chasuble are also of silk. The upper one is of lighter texture; it shows a pattern consisting of lozenges connected by rays. The under-tunic shows a very fine interlacing pattern of geometrical design. The stole is worn crossed on the breast, the lower portions being broader than the upper. Its ornamentation is a pattern of scale-like design, which shows alternately figures of lions and birds set in a pattern of finely-traced leaves. The girdle is of silk, but only long untwisted strands remain. The feet and legs up to the knees are covered with silk stockings, which seem to be of a fine network texture. Three broad parallel bands and as many smaller ones are wound round in spiral fashion, and fasten them. The shoes, which come up above the ankle, and have two deep slits, are made of gold brocade; they are ornamented by circular embroideries sewed on. The soles of the shoes are of leather. The pastoral staff lies in the arms, from the right shoulder to the left foot. It is of soft wood, ending with a ferrule and spike; at top there is a spherical ball of hammered bronze, out of which issues a crook of soft wood, which ends in a bronze lily set in a square socket. At the feet stands the chalice, also of soft wood, very finely turned; the cup is a hemisphere, and on it rests the patina.

GENERAL.

M. Waltner has completed his large etching of the *Night Watch*, and proofs are to be seen at the publishers, Messrs. Boussod, Valadon & Co., in London and Paris.

A Fine Art Exhibition has been opened in Elgin, to which many Scottish artists have contributed works. Pictures are also lent from the collections of the district.

Mr. H. E. Rensberg has presented a complete set of reproductions of Rembrandt's paintings and etchings to University College, Liverpool.

An Art and Industrial Exhibition is to be opened at Toulouse on May 15 next.

A Free Library and Museum has been decided on for the town of Newbury as the jubilee memorial.

The Old Tower at the corner of Silver Street, Norwich, is to be restored at a cost that is not to exceed 70*l.*

The Collection of works of art and furniture belonging to the Château Langeais lately sold in Paris realised 427,562 frs.

A Competition restricted to Italian sculptors will shortly be arranged in order to obtain a design for a memorial of Signor Minghetti, for which 4,000*l.* will be assigned by the State.

Mr. William Dove, who at one time was known as a leading marine artist in the North of England, has died in the Whitby Workhouse.

Mr. Swinnerton, of Manchester, has obtained the commission for the statue of the late Hugh Mason, to be placed in the town of Ashton-under-Lyne.

Mr. J. M. Keiller has undertaken to pay off the debt, amounting to 10,500*l.*, on the Albert Institute Buildings, Dundee, which were designed by the late Sir Gilbert Scott.

Mr. Alfred Conder, F.R.I.B.A., architect, of Palace Chambers, Westminster, district surveyor for Woolwich, has been appointed by the Metropolitan Board of Works to act as temporary substitute in the district of Charlton, Lee, and Kidbrooke, rendered vacant by the decease of Mr. J. Collis, the late district surveyor.

Mr. W. F. Maitland has contributed 1,000*l.* to the restoration fund of Stansted Mountfichet parish church.

The Centenary of the birth of the Rev. Richard Harris Barham, the author of the "Ingoldsby Legends," is proposed to be celebrated by the erection in Canterbury of a new museum and public library.

R. ADAMS,

17 BLACKMAN STREET & 7 GREAT DOVER STREET, LONDON, S.E.

INVENTOR and PATENTEE of the

SAFETY WINDOW WITH REVERSIBLE SASHES

FOR

INEXPENSIVE & PERPETUAL CLEANLINESS

Which has gained at the INTERNATIONAL HEALTH and SANITARY EXHIBITIONS

2 Gold, 4 Silver, and 4 Bronze Medals, and 16 Diplomas of Merit.

The fearful sacrifice yearly of Life and Limb of persons in cleaning windows through sitting or standing outside whilst so engaged is most appalling. This can now be entirely prevented. The Patentee, having given this subject the most exhaustive study, is now prepared to supply his patent fittings suitable both for old and new windows at prices to meet the means of all. These improvements are protected by several patents, by each of which the outside of each sash can be reversed for cleaning, and under this new system that duty is rendered a pleasure, whilst the danger, risk, and tremendous responsibility of moral and statute law is removed.

These patent fittings can be procured from 5*s.* for each sash and all builders have the right conferred upon them to fit the same in the purchase thereof, and that all shall have the benefit of this national boon, special Agencies are being established throughout the United Kingdom. None but practical and responsible firms are appointed. Such firms are invited to apply for unrepresented districts at once, as it is desirable to complete the list as soon as possible.

The present representatives are:—

Barnstaple	Hancock, Pilton Street.
Belfast and 10 miles round	W. J. Watson, Royal Avenue, Belfast.
Bournemouth and 10 miles round	H. W. Jenkins & Son, Builders.

We have lately supplied H.M. Board of Works with a large quantity for Casing the Curfew and Chancellor of Garter Tower, Windsor Castle.
Samples of either Stone and full particulars on application.
THOMAS FREE & SONS,
Naphill, High Wycombe.

GRUNDY'S PATENT WARM-AIR VENTILATING FIRE GRATE.
The novelty, superiority, and advantage of this patent consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.
TESTIMONIALS.
"9 Victoria Chambers, Westminster, S.W.: June 10, 1884.
"SIR,—I have much pleasure in testifying to the efficiency of your patent warm-air fire grate. It has been very successful, and given every satisfaction where I have used it. Yours, &c.,
"To Mr. Grundy. JAMES WEIR, F.R.I.B.A."
"6 John Street, Bedford Row, W.C.:
"December 16, 1885.
"DEAR SIR,—I have now had an opportunity of testing your patent grate, and am glad to be able to say that I am most agreeably disappointed, because, as you are aware, I was rather sceptical about its powers when you showed it to me; but now I can say it answers admirably, and heats abundantly my porch-conservatory.—I am, yours truly,
"R. S. LANDER, F.R.I.B.A.
"To Mr. John Grundy."
From James Garry, Esq., Architect, West Hartlepool, July 1884.
'DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.—Mr. John Grundy."
From Hon. and Rev. G. G. C. Talbot, M.A., Withington, Cheltenham.
"DEAR SIR,—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.—Mr. John Grundy."
Society of Architects, Architectural and Building Trades Exhibition, 1885:—"5 Great James Street, Bedford Row, May 1.—The warm-air ventilating grate shown by Mr. John Grundy at Stand 75 Floral Hall, is an admirable contrivance for utilising the heat conducted through the back and sides of the stove, for warming schools and buildings by a supply of freshly warmed external air."
Apply to JOHN GRUNDY, 30 Duncan Terrace, City Road, London.—Works: TYLDESLEY, near Manchester.
Agent for Scotland, SEPTIMUS HARPUR SMITH, 1 Upper Gilmore Place, Edinburgh.

FLAT BRICK FIRE-PROOF FLOORS.

LONDON, 1874.

LONGITUDINAL SECTION.

BRUSSELS, 1876.

THE BEST as well as the CHEAPEST Fire-proof Floors yet introduced. Their small cost makes them specially suitable for artisans' dwellings, residential flats, offices, chambers, and private houses.

They are constructed with hard-burnt bricks, laid flat, and bonded on the upper face with tough concrete 3 inches thick; and by the method of laying all iron is protected from the action of fire.

Experiments show a resistance to load and impact greater than furnished by the ordinary concrete floors. No thrust is transmitted to the walls, as in all arched construction, the walls being tied in and strengthened.

The floors are practically noiseless, the different densities of the concrete, brick and plaster, with the air space above, intercepting the sound vibrations.

The brick soffit forms a capital key for the plaster, and no laths or counterceiling are necessary, but for high-class work wood blocks are introduced in the soffit, to which the ordinary lath and plastering or fibrous plaster is fixed. This also provides a second air-space, and furnishes the most perfect sound-resisting floors known.

They are not affected by water, acids, or alkalies, and they may be fixed during the progress of the building, thus dispensing with the use of internal scaffolding.

The concrete being tough instead of friable, the boarded finish may be nailed down without the use of sleeper joists. It is recommended to use an inch strip as a sleeper fillet. This will provide ventilation, and space for gas and water-pipes.

The depth of the finished floor is 6 to 9 inches only, and when the saving on this head is taken into account, the cost does not exceed that of the ordinary combustible timber floor of corresponding strength.

TRADE NOTES.

ON St. Botolph's Day, in the presence of the Lord Mayor and Sheriffs of London and Middlesex, who attended in state, eight stained glass windows were unveiled in St. Botolph's Church, Aldersgate, E.C. They contain incidents in the life of Our Lord, and were executed by Messrs. Ward & Hughes, of 67 Frith Street, Soho Square, W.

MESSRS. ARCHIBALD SMITH & STEVENS have just completed at Norfolk House, Thames Embankment, an hydraulic lift for the service of the entire height of building. It is worked in connection with the Hydraulic Power Company's mains.

THE inscription on the tomb of Chief Justice Gascoigne, of Gawthorpe Hall, in Harewood Church, has been restored in bronzed latten brass. The work has been carried out by Mr. Gawthorp, of Long Acre, London.

MESSRS. F. SANDER & CO., of St. Albans, have just issued the first monthly part of a new work on orchids. It is illustrated in colours and printed in English, French, and German. The illustrations are well executed, and amongst the writers we find the name of Professor Reichenhart, of Hamburg.

IT is interesting to notice that Messrs. Lawrence & Son, of Bracknell, manufactured and supplied the whole of the bricks for the Royal Holloway College, opened on Wednesday, under a contract made direct with the late Professor Holloway. The plain brickwork is faced with their machine-made wire-cut facings, and the circular bays with their rubber bricks, which gained the only gold medal awarded for bricks at the late Building Exhibition.

MR. H. BASSANT has just laid his ½-inch solid Burmese teak imperishable parquet in two wards of the old wing at Queen Charlotte's Lying-in Hospital, and in four of the wards in the new wing opened last Friday by the Princess of Wales. The ½-inch solid Burmese teak is more durable than 1-inch solid, as there is no groove to wear through, it being glued and pinned to the existing floor. Mr. Bassant deserves a word of congratulation on his beautiful floorings, particularly the teak, the most valuable of all our woods, and which could receive no better treatment in any hands.

MR. MUSCOTT has sent us testimonials as to durability and permanency of colour of his Whitland Abbey green slates, and we find that they have been used all over the country, notably on the Asylum, Gloucester; part of Keble College, Oxford; and the under-named churches, &c. :—Avebury, Docklow, Duffryn, Neath, St. Jude's, Southampton; Holy Trinity, Abergavenny; Llanbadarn Fawr, near Aberystwith; Kinnersley; Goodrick; St. John's, Walford; Camrose; Camrose Schools; Moat, Pembrokeshire; Penmorgan House; the Parsonage House, Langbarne, &c. We also hear that Mr. Muscott's window-sills and flooring slabs are of very superior quality, of good colour, and very durable.

NOTES ON NOVELTIES.

Improved Folding Lattice Shutter.—We would draw our readers' attention to the improved folding lattice shutters manufactured by Messrs. Rownson, Drew & Co., of 225 Upper Thames Street and 113 Queen Victoria Street. The advantages possessed by the patent are those which are sought in the class of shutters to which it belongs and render it particularly welcome. It can hardly fail to secure universal appreciation. The following description explains the principles and objects of the patent, for which a first prize was awarded at the Inventions Exhibition :—This folding lattice shutter has for its object the better guarding of windows and doors of private houses, offices, warehouses, and shops, where space, security, and ventilation is a great object, and for providing a more efficient and simple means of protection than the ordinary revolving and other shutters hitherto in use. It is especially useful for private houses, this lattice shutter not interfering in any way with light and ventilation, nor with the Venetian or other blinds, and when drawn back it is almost hidden from view. The lattice shutter consists of two wings of equal size, each of which is composed of a number of perpendicular flat iron bars crossed by a number of short horizontal bars strongly rivetted together. The perpendicular bars are regulated in length to the height of the door or window, and are placed at equal distances from each other; the principal perpendicular bars run upon wooden rollers upon the window board or door sill. The lattice is fastened in a suitable manner to the brickwork or panels right and left of the door or window to be protected. The lattice is locked in the centre, also near the top and bottom. The bars are of wrought iron ¾-inch wide and ¼-inch thick, but can be made in any other strength or metal if desired. The advantages these folding lattice shutters have over ordinary revolving and other shutters are manifold: they are cheaper, can easily be fixed anywhere without any alteration to existing brickwork or panels, and in the smallest possible space. The

PRESS OPINIONS.

Messrs. SANDERSON & SONS have been awarded for their Wall Decorations the only Gold Medal at the New Orleans International Exhibition. This Medal may be considered the highest ever awarded to a paper stainer, as it was not obtained, as usual, in competition with other English firms only, but with the whole world—English, French, German, and American firms being all in one class.

PAPER-STAINING WORKS
CHISWICK.

windows can be left wide open, thereby admitting light and air, at the same time protecting the room against burglars; they are likewise excellently adapted for nurseries in upper storeys. These folding lattice shutters are highly recommended by the medical faculty as supplying a long-felt want.

A CONTRACTOR'S CASE.

ON Friday last the case of Derwin and others *v.* the Drumcondra, Clonliffe, and Glasnevin Commissioners came on for hearing in the High Court of Justice, Dublin, before Sir Michael Morris and a special jury. The action was brought to recover 3,666*l.* claimed on foot of a contract for drainage and sanitary works executed in the defendants' township, and in respect of extras connected therewith. The defendants denied liabilities for the amount claimed, and pleaded that the greater portion of the cost of the work was covered by the contract, but that the Commissioners were ready to pay for ascertained extras. The original contract was for 5,600*l.*, which included 300*l.* which the defendants agreed to allow to the plaintiffs in consideration of their using Coal Island (or Irish-made pipes) in the drainage works.

When the case was called, it was stated that a settlement had been arrived at by which plaintiffs abandoned certain items of their claim, amounting to 2,224*l.* The remainder of the demand was referred to the arbitration of Mr. P. F. Leonard, C.E., on behalf of the Commissioners, and Mr. Patterson, C.E., on behalf of the plaintiffs, with power to call in as umpire Mr. Thomas Drew, R.H.A., architect.

THE BELGIAN GLASS TRADE.

AN application was made by the Earl of Rosebery as Foreign Secretary for information as to what extent is a statement true which lately appeared in some French newspapers, that the disturbances in the glass-making districts of Belgium have been chiefly owing to changes having been introduced into the industry which replace hand labour by machinery, and also the substitution of large for small establishments. Lord Vivian, in the course of his reply, says:—There had been no previous indication of any intention on the part of the glass-workers to strike, nor was there any justification for it; their wages, though they had lately been reduced about 15 per cent., were still high, a good glass-blower being able to earn from 400 frs. to 600 frs. a month. The savage attack on this flourishing industry has been ascribed to the introduction by M. Baudoux of a new system called the *four à bassin*, by which the raw materials of glass are fused in one furnace instead of in separate receptacles, and great economy of fuel, combined with increased production, are secured. But it does not appear that the adoption of this invention—which has in no way injured the workmen or reduced their number or pay—provoked any opposition on their part, nor did other establishments, which employed the same system, suffer so severely as that of M. Baudoux. The strikers contented themselves with breaking all the manufactured glass in these establishments and spoiling the materials in process of fusion by throwing in iron; the wanton destruction of M. Baudoux's house and factory is, therefore, probably attributable to special causes connected with his relations towards his workmen.

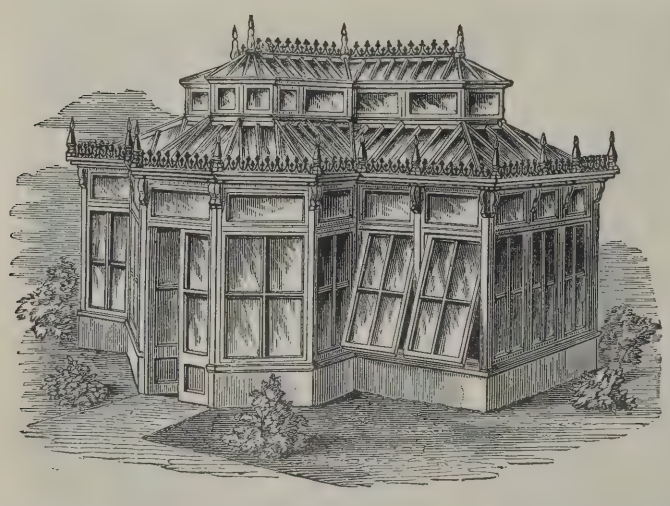
HOUSE OF COMMONS ARRANGEMENTS.

THIS week we give some of the evidence which was supplied by the late Mr. E. M. Barry, A.R.A., to the Parliamentary Committee, and which has lately been reprinted in the Parliamentary papers. Right Hon. T. E. Headlam, chairman.

The floor of the House of Lords at present is perforated, I believe?—It is.

And through those perforations it communicates with an air-chamber below, of considerable size?—Yes, as large as the House itself in its floor area.

What is the depth of that chamber?—I do not remember the depth perfectly, but it is sufficient for a man to stand up in.



It is more than six feet high?—Yes.

You consider, I think, that this communication with a chamber below considerably increases the difficulty of being heard in the existing House?—It so appears to me.

You consider it a principle that in any new House a communication from the House above to the chamber below would increase materially the difficulty of being heard?—A communication of that nature would.

Any communication which would have the effect of making the speaker's voice audible in the chamber below?—I think so, more or less.

In addition to the evil arising from the communication to the chamber below, there is a current of air constantly coming

WOOD PAVING.

up from this chamber below, and passing upwards through the House, is not there?—That is so.

Do you think that that also increases the difficulty of being heard?—I should have said not materially; but it has a tendency that way.

You consider, without the continuous introduction of fresh air into the chamber below, that the mere communication from the upper to the lower chamber, so as to enable the voice to be heard in the lower chamber, is a very considerable obstacle to the power of a speaker being heard in the upper chamber?—I think so; it must be a considerable difficulty, because it must add a considerable space to the House, and make it larger than it appears to be.

That opinion of yours, I think, is not shared by Dr. Percy, is it?—I think not.

Could you refer us to anyone who could give us an opinion upon that principle of acoustics?—It appears to me scarcely a principle of acoustics, but rather of feet and inches.

But Dr. Percy entertains one opinion and you entertain another?—It is a question of fact whether you can be heard in the chamber below or not; anybody can test it; if you go down into the lower chamber while speaking is going on above, you can hear every word that is said.

I do not ask about the facility of being heard in the chamber below; I have no doubt of that fact, but my question is as to whether the being heard down below is an obstacle to being heard above?—I think that rather turns upon this question: is it easier to speak in a small House or in a large one? Because the present House is unquestionably enlarged to the extent of the space below, inasmuch as anyone in that space below can hear what is said above.

How is it that Dr. Percy does not adopt the same view as yourself upon that point?—I cannot say.

Mr. Cowper: Should you not say that although the present floor has so many holes in it that the sound can pass through it, it is yet sufficiently solid to cause a reverberation of the sound?—So far as its solid portions are concerned, unquestionably.

Therefore you cannot altogether overlook the effect of the floor as at present constituted in reflecting the sound upwards?—The floor being, I will say for the sake of argument, perforated to the extent of half its surface, it would have just half the effect, or thereabouts, in reflecting which it would have if it were entirely solid, in my opinion.

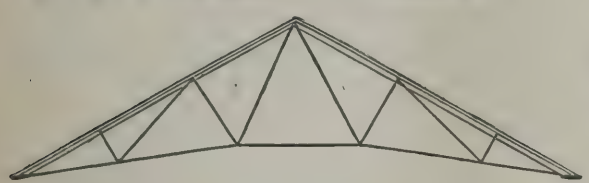
Do you think it would be possible to manage the ventilation from below, and yet to have a much larger portion of the floor solid than is solid at present?—I think it would.

Mr. Cardwell: I suppose if anybody disputed your opinion as to the room below diminishing the facility of being heard in the room above, a very simple experiment might be tried by putting an impervious carpet on the floor of the House, and trying the effect of speaking in the House, so carpeted?—Carpet would perhaps scarcely be impervious enough, but the experiment might be tried with boards.

Mr. Darby Griffith: With regard to the presumed effect of a current of air arising from the floor impeding speaking, if sound will travel more than 1,000 feet a second, and the House is less than 100 feet across, which of course it is, it would not take so much as the tenth part of a second for the sound of the voice to travel across the room; in that case could the up-current have any material effect upon the transmission of the sound?—I do not think it has any material effect. I may perhaps state, for the information of the Committee, that I went over to Paris to examine the Chamber of Deputies there, and I found that their system of ventilation is exactly the reverse of this; they introduce the air at the top, and take it out of the floor; their architect considers that a much better system for acoustic reasons, with reference to the question of the ascending current of air.

Sir Charles Lanyon: Do you consider that the current of air either ascending or descending has any effect upon the acoustics?—I do not myself think it has any appreciable effect.

Sir Frederick Heygate: The present House can be ventilated in both ways, can it not?—Yes, it can; but the system adopted in Paris is so in defiance of what I may call the natural tendency of air to rise, that it is much more difficult, and requires many more appliances to carry out that system than one in which the heating of the air and its consequent natural rise assist the ventilation.



Sir Charles Lanyon: Are you aware of the average velocity with which the air passes through the floor under ordinary circumstances?—No; Dr. Percy would have that information.

Mr. Baillie Cochrane: Are you aware whether there are sittings for every member in the French Chamber?—There are sittings for more than the number of members, because since the French Chamber was built they have reduced the number of members.

Sir Charles Lanyon: Are you not aware that if you adopt a downward system of ventilation you must have a very much more powerful extractor for the purpose of carrying the ventila-

tion that way?—The ventilation upon that system is more artificial, and therefore it is more difficult to carry into effect.

Mr. Baillie Cochrane: Are you aware how many places there are in the French Chamber, including strangers; that is to say, how many can be seated in the French Chamber altogether?—I have got that information, but I cannot state it from memory. The First Commissioner of Works has got the plans, which he is about, I believe, to send to the Committee, and they will contain all that information.

Mr. Waldegrave-Leslie: Did it ever occur to you whether a bridge, or any other communication, could be made for the use of members only between the left division lobby and the present refreshment-rooms?—That suggestion has been made, but it involved a new doorkeeper, or some provision of that kind, and it was not entertained further.

It used to be the case in the old House of Commons, and a doorkeeper was put for that purpose, I think?—Yes.

Viscount Cranborne: Have you at all considered to what extent greater speaking accommodation would be given by raising the altitude of the steps which separate the successive seats, so that a member on rising should be more visible to the Speaker; I mean so as to make more of what is on the Continent called a mountain of the seats?—I do not think that there would be any advantage in that arrangement.

I apprehend that at present a good many seats are rendered unavailable for the purposes of members who desire to address the House, because when they rise they are not practically visible to the Speaker across the heads that intervene; if the steps were larger that would be much more possible, and practically every bench would then be available for members desiring to speak?—There would be no difficulty in raising the seats in a new construction, but if it were done in the present House there would be difficulties as to the height of the galleries.

It would necessarily involve modifying the gallery very considerably, then?—I think so.

Is it your impression that the gallery is practically very valuable?—As space it is.

I mean as sitting space?—That is rather a question for the Committee than for me; but, of course, if the House is too small at present, a diminution of the gallery would render it smaller than ever.

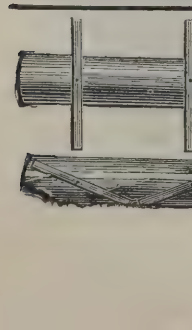
I suppose it would be perfectly possible to get exactly the same number of seats in the present House and the gallery combined, in the form of one slope, as exists now in the form of the gallery and the House?—Undoubtedly, if we were treating the question *de novo*.

It would only be treating the question *de novo* so far as to erect a little new boarding. I meant to ask whether it was not possible, so to speak, to fuse the existing seats of the gallery with the floor of the House, so as to make what I call a mountain, by which every seat up to the very top would form part of the actual House, and yet be available for members desiring to address the House. There are, in fact, seven rows now. Could not you make seven rows in a mountain?—Clearly; but then you would lose the gallery which is now over some of them.

No. Because plus the gallery there are only seven rows now altogether?—Speaking from memory I forgot the precise number. If there are only seven I was wrong in what I said just now; it could not be made to give the same accommodation.

Mr. Darby Griffith: You would consider that the preferable arrangement of the accommodation for a House of Assembly of this kind would be that the seats should be on the floor, so to speak, without a gallery?—A gallery is not an advantageous arrangement for those who wish to take part in the business of the House.

Viscount Cranborne: But if it was in your power to drive the windows back, it would then be possible to bring in the seven rows of seats in the form of a mountain, would it not?—Yes, that would be widening the House.



It would be widening the top of the House, but it would leave the lobby as it is, and only encroach upon the external air?—Of course the lobby would have to be thrown out to the same extent.

If you only widened the top of the House so as to drive the gallery back over the lobby, you would only encroach upon the external air, would you?—That is so.

Mr. Waldegrave-Leslie: You would have to cut through the walls of the House for that purpose, would you not?—Yes.

Mr. Cowper: You would have to rebuild the walls of the House itself in order to provide support for the roof, would you not?—Yes, to carry the roof.

Mr. Waldegrave-Leslie: Could not you obviate that by girders and pillars?—It is difficult to say what could not be done in that way, but it would be a very hazardous operation. The roof of the House of Commons is very heavy. In fact, the weight has been considerably increased lately by constructing all the arrangements there of incombustible materials. The

ceiling itself is a considerable weight, and altogether the amount of weight on the side walls is very great.

Viscount Cranborne: You would prefer a reconstruction to that?—It would practically be, I think, reconstructing the House to carry out such a scheme.

Chairman: In a plan I think you give to members on the floor an increase of seats from 306 to 367?—That is so.

Then what is the number of seats for peers and official seats?—It gives 32 official seats and peers' seats; but I think that number will have to be increased by giving the back row at the door end also to the peers. Of course if that were done it would diminish the accommodation in the House to that extent.

To what extent would it diminish the accommodation?—You must strike off 30 from the accommodation of members.

So that that would give an accommodation of 337, as against the present accommodation of 306?—That is so.

Which would be an increase of 31 members within the House, and an increase in the number of peers' seats from 44, as at present, up to what?—There would be 46 peers' seats, and 16 official seats.

The official seats being at the Speaker's end?—The official seats would be at the Speaker's end.

That is the extent of the additional accommodation upon the area of the House?—That is the extent of the accommodation according to this arrangement of the seats, but by a rectangular arrangement of the seats you would gain accommodation.

With the rectangular arrangement of seats you obtain, I see, for members on the floor, 429 seats?—The number of members on the floor would be subject to a similar reduction for the increase of peers' seats; in this case 20 seats would have to be deducted for peers, leaving 409 upon the floor.

What would be the number of peers' seats?—There would be 36 peers' seats and 16 official seats.

By peers' seats you mean the seats under the gallery at the Serjeant-at-Arms' end, do you not?—Yes.

And you mean by the official seats, seats at the other end, near the Speaker's chair?—Yes; that is a new suggestion.

That would practically give about 100 additional seats for members on the floor, and what addition in the gallery?—The gallery would hold about 160.

As against how many in the present gallery?—The present gallery holds 124. In this plan the front row of the gallery over the door is shown to be given to members; but that would be an inconvenient arrangement, and therefore that number would have to be deducted from the members' gallery, because the peers' and diplomatic gallery would have to be there. Therefore, instead of giving 160, it would be 136 members in the gallery.

You heard what Mr. Ayrton said with respect to the difficulty of members at the end of the present House hearing or taking part in the proceedings, did you not?—I did.

Would not that difficulty be very much increased if you added to the length of the House?—I think it would.

Would it not be the case that in the new House, elongated according to this scheme, the practically available seats would be nearly the same as they are at the present moment, and that there would be merely an addition of unavailable seats at the extreme end?—To a certain extent that would be so.

Would it not make the area of the House pretty nearly the area of the House of Lords?—I think it would.

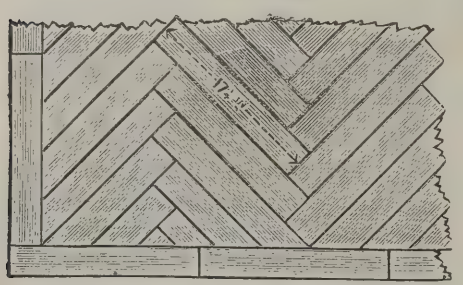
Would not the same objections which apply to being heard in the House of Lords apply with greater force to the House of Commons, where the body assembled is not quite so quiet as the body assembled in the House of Lords?—The House of Commons is not so high as the House of Lords.

Would that make any material difference?—It would make a considerable difference.

Mr. Waldegrave-Leslie: Is there a chamber underneath the House of Peers in the same way as there is under the House of Commons?—There is.

So that those acoustical difficulties would be the same?—According to my judgment they would.

Mr. Cardwell: Would not the difficulty of hearing vary very much, according as the House was full or empty?—I think it would.



Is not the House of Commons often much more full than the House of Lords, upon the average, is?—Much more.

When you speak of available seats, do you mean available for sitting only, or for sitting and hearing also?—I presume the chairman meant to refer to those seats from which members would speak.

Supposing you include in the definition of "available seats" hearing as well as sitting, would not any change which made the House larger have a tendency to make the number of available seats even less than at present?—I think it would; the larger the House is made, no doubt, the greater must be the difficulties to be encountered.

Viscount Cranborne: How many cubic feet would there be in this proposed House?—The cubical contents of the present

WILLIAMS & CO.,
Lillie Bridge Works, London, S.W.,
MANUFACTURERS OF PATENT
METAL CASEMENTS
AND
LEADED WINDOWS.
Our Patent Steel "SIMPLEX" Casements have the following advantages over any other Casements in the market:—
They are thoroughly weathertight.
They can be made to open inwards or outwards, hung at the sides, or head, or sill, and in all cases the PLANE OF GLASS and the SIGHT LINE are the same.
They will not SAG, or TWIST, or JAM.
The Glass being secured by metal fillets the ragged appearance of putty is avoided.
The face being moulded has a more pleasing appearance than the ordinary uncouth finish.
By the use of these Casements all difficulties of window-cleaning are overcome.
The Patent "Cottage" Casement is made for such positions where plane of glass and thorough weathertightness are not absolute requisites, and where the extent of finish is not necessary.
Prices and particulars will be gladly furnished on receipt of inquiry.

House are 127,000 cubic feet, which would of course be increased if the House were lengthened.

Chairman: What is the exact increase caused by the greater length?—The addition to it, by the elongation, would be about 30,000 cubic feet.

Mr. Cardwell: Does that include the chamber below, or is it only the House itself?—That is exclusive of the chamber below; the cubical contents of the chamber below are about 27,500 cubic feet.

A corresponding addition would have to be made to those figures if this alteration were made, I suppose?—If the same system of ventilation is carried out, undoubtedly.

Mr. Cowper: Would you explain what the walls carry now which you propose to remove; do they carry the roof?—They only carry some small cross-beams, which could be provided for in other ways, not the main roof.

The main roof rests upon the walls, which would still remain after you had made your alteration?—It does.

So that this alteration could be made without any material expense?—I have not gone into the question of expense, but of course the expense would be much less than if you interfered with the main walls of the House.

I mean you would not have to make any alteration as regards the roof itself?—I think not.

What provision would be made for the purposes of the division lobby?—If you turn to the plan on page 6, you will see the arrangement; the division lobby would be carried all round the House, as at present, but the private rooms now behind the Speaker's chair would be sacrificed for that purpose.

Sir Charles Lanyon: But you propose to provide them where they are shown upon the plan in red?—I have made that suggestion to meet the difficulty.

Mr. Waldegrave-Leslie: Would there be any increased difficulty in the lighting (I refer to the daylight) of the House by this addition?—No.

Not of that part which is added on?—It would be lighted exactly in the same way as the present House is.

Viscount Cranborne: I see that you have put some of the official seats behind the Speaker's chair. Do you see any reason why that suggestion should not be applied to all the strangers' seats? Would you not by that expedient avoid the difficulty of having a certain number of seats for members from which no one could by any possibility ever address the House?—I think there would be great difficulties as to access to seats behind the Speaker's chair for strangers. Probably that would be a great objection, owing to the difficulty of keeping order; it would involve, as it appears to me, reversing the whole arrangement of the House.

Could not you put the Serjeant-at-Arms closer to the door?—The difficulty would be as to where the strangers are to come from to get behind the Speaker.

Could not they come round by the library?—I think that would be very inconvenient.

With reference to another point, as to the acoustic properties of the House, I want to call your attention again to what I alluded to a few minutes ago, namely, the keeping the seats continuous up to the bottom of the windows, instead of dividing them into a lower and an upper tier. I understand you to say that the human thigh, being a constant quantity, you would thereby lose the seats in the gallery; but what I wish to know is, if it were decided that seats in the gallery were not practically of any great utility, you would not thereby very much diminish the amount of cubic area which the speaker's voice would have to fill, would you? I speak merely with reference to the acoustic properties of the House, not the increase or loss of room. I ask whether you would gain in acoustic value by obliterating that angle, which exists in consequence of the overlapping of the galleries over the benches?—I do not think the existing conditions are unfavourable to acoustics.

You think the conditions would not be more favourable if you had the tiers with a continuous slope?—The question would be this: If you do away with the galleries, you would have to enlarge the House to get the same amount of accommodation, and therefore you must enlarge the area of the House.

The thesis I put to you is that the galleries are useless, because they do not afford accommodation for anybody who desires to address the House; the difficulty is not in finding accommodation for members in a division, but in finding accommodation for those who take part in the proceedings. For that purpose, would you not gain in the acoustic properties of the House by obliterating the cavity which now exists underneath the galleries, and by continuing the seats in a slope up to the lower edge of the windows, so that the whole of the cavity and space would disappear?—Now, I think, I understand you; the arrangement that you suggest involves, as I understand it, a diminution of the cubical contents of the House; inasmuch as it involves that it would, I think, be favourable to hearing.

Not only that, but would it not further have an acoustic value in presenting a more regular form, instead of a form in which the voice is necessarily broken and lost?—Whether it

MR. C. B. HARNESS, the Eminent Consulting Medical Electrician, has been specially retained by the Company, and may be consulted daily (without charge), on all matters relating to health and the application of Curative Electricity. Residents at a distance, and those unable to avail themselves of a personal consultation, are invited to write for a PRIVATE ADVICE FORM, which will be forwarded POST FREE, on application to THE MEDICAL BATTERY COMPANY, LIMITED, 52 OXFORD STREET, LONDON, W.

On receipt of Post Office Order or Cheque, value 21s., crossed London and County Bank, THE MEDICAL BATTERY COMPANY, LIMITED, 52 Oxford Street, London, W., undertake to forward the ELECTROPATHIC (BATTERY) BELT, as described above, for either Lady or Gentleman, free by post to any part of the United Kingdom.

"ELECTROPATHY; or HARNESS' GUIDE TO HEALTH," will be sent post free on application to the

The MEDICAL BATTERY CO., Ld., 52 OXFORD STREET, LONDON, W.

would be a better form for speaking than the present is questionable. I think a greater rise in the steps might be favourable, but not so great a rise as would take them nearly up to the sill of the windows.

Would not the favourable effect be proportional to the rise: the more you get the House into the form of a horizontal cylinder would it not increase the acoustic properties of the House?—I think there would be a point where the advantage would cease, and it would be somewhere between the present steps and the sills of the windows.

On what ground do you consider that the advantage would cease at some intermediate point?—I think you would be too much above the member speaking if you raised yourself up to the sills of the window.

You have never yourself practically gone into the House to listen to a speaker from the gallery, perhaps?—No, I have gone into the strangers' seats, but never into the members' galleries.

Is not it the case that the form exercises quite as important an effect upon the acoustical properties of a building as the volume, that is to say, the cubical contents?—Unquestionably.

And that any broken form is very injurious to the acoustical properties?—It is very difficult to dogmatise as to the forms which are injurious, but I generally find that any unusual proportion is unfavourable to acoustics. I mean, for example, if a room is unusually long or unusually high, or out of the general proportion in any way.

Your professional knowledge furnishes you with nothing like a formula in that respect, does it?—I am afraid not.

Mr. Darby Griffith: In point of fact, is this plan submitted by you rather to meet the wishes of the Committee, or does it really satisfy your own judgment?—It was prepared simply to show how an increase of accommodation could be gained.

It is not a plan which would meet with your approbation in comparison with other plans you could produce upon the subject?—It is not; I think it is too long.

Viscount Cranborne: Is not it the case that in the House of Lords a good deal of the voice is lost by the very elaborate character of the ornament, and the absence, therefore, of the regular form?—I should doubt that; it is a very large place to fill with the voice; I think that is the principal difficulty in the House of Lords.

Mr. Waldegrave-Leslie: Is it not also owing very much to the very long space beneath the House of Lords, which is very nearly equal to one-third of the chamber of the Lords itself?—I have already stated that I think that that has a prejudicial effect, but I should not like to state that I thought it was the main cause of the difficulty of hearing.

Mr. Cardwell: If there is any objection to the present House on the ground of the difficulty of hearing, the effect of adding 15 feet to it would not be to diminish those objections?—I think not.

Would it be to increase them?—I am afraid it would.

Viscount Cranborne: Have you ever thought of the advantage, for the purposes of enabling members to address the House from all parts of it, of removing the Speaker right into the wall behind his present chair?—I have considered the possibility of putting him as far back as possible under the gallery, but I do not think you could put him right back into the wall, because that would be right under the gallery.

What evil would result from his being right under the gallery?—It would be a very undignified and undesirable position.

You could remedy that, I suppose, by architectural expedients?—Scarcely.

Chairman: Have you ever thought of the plan of putting the Speaker at the side of the House; that has been suggested to me?—That would be a very difficult thing to do, the arrangements of the whole plan of the House having been conceived on the opposite principle.

As I understand it, the side walls of the House of Commons are very solid and substantial?—They are.

And they support the roof?—They are the main walls supporting the roof.

The walls of the division lobby are light walls; they would not be strong enough to support the roof?—Not to support such a roof as the House of Commons roof; they carry their own roof.

Supposing the plan were adopted of keeping the area floor of the House of Commons of the same size as it is at this present moment, and of expanding the size of the roof, could that, do you think, be accomplished without practically building a new House of Commons?—I do not think it could.

Will you have the goodness to look at Mr. Bazley's section. Suppose that, instead of the seats on the sides of the House rising as they do at the present moment, each tier slightly above the one in front of it, they were to rise at a more rapid inclination to the level of the gallery, and were then carried through the gallery to some elevation, so as to give a continuous rise from the area of the House up to, we will say,

eight rows. Could that be accomplished, do you think, without practically building a new House?—I do not think it could.

Supposing the Committee were of opinion that that was a right alteration to make, if it could be made, do you think that that operation could be accomplished by building up the division lobbies during the session, and then completing the work in the recess, so as not to have the necessity for a temporary House of Commons?—I do not think it could. It would be a very serious operation.

Mr. Darby Griffith: In fact, to effect an operation of that kind, would not you practically have to obliterate the whole of the wall above the junction of the present gallery with the present House?—A great part of it. Some portion of it would have to remain as piers or columns, to help to support the roof, which would be obstructions, of course, in the House as altered.

They would be obstructions of a very serious nature as regards hearing and seeing the proceedings in the House, would they not?—I think they would be very considerable obstructions.

Can you give us some idea, in a general way, of the scantling of the piers, for instance, that would be required?—I do not think I could do that without some consideration.

Can you give us any general idea of what portion of the wall would be left for that purpose?—Taken at the level of the windows, if you assume the minor piers removed, and the windows removed, the major piers would have to remain.

Can you give us an idea of what the scantling of these piers would be in comparison with the intervals between them?—The piers would be about three feet.

What would the intervals between them be?—Ten or 12 feet.

Then, with regard to the perspective effect of a person seated half-way in the gallery, with regard to communication with the Speaker, would not piers of this form and shape, standing in that manner, very seriously interfere with the communication by sight or hearing?—I think they would; they might perhaps be made, by the use of iron, a little less than three feet, but still they would be objectionable.

It would be a row of intermittent obstructions in the main body of the House, as we may call it, for such it would be then, and that would have a considerable effect in impeding oral and visual communication between the main portions of the House, would it not?—It would; it would be like a row of pillars in a church, with a nave and aisles.

Viscount Cranborne: Could not you have a considerable width of arch?—Not with the present construction; not without entirely altering the House.

On grounds of style or on grounds of structure?—On grounds of structure.

Mr. Waldegrave-Leslie: You would have such arches as would agree with the plan of the arches of the upper roof, that is to say, flat Tudor arches?—Yes, I assume that you would have a pier and an arch in each bay—each bay is about 15 feet in width.

Could not you double the bays?—I think not.

Mr. Darby Griffith: If you were to double the bays to obliterate one of the piers, would not there be a liability to throw a greater weight upon the remaining piers than they could properly bear?—Yes, with the existing conditions of the House of Commons I should hesitate very much, indeed, to take the risk of such a work.

Viscount Cranborne: Could not the roof be made lighter than it is now?—It could be reconstructed altogether, but taking it as it is it is very heavy.

Sir Charles Lanyon: I think that by taking out one pier, namely, the centre or smaller pier of the window, leaving the major pier to support the window, at the back row of the gallery not a single member would be able to see the Speaker?—There would be considerable difficulty, no doubt.

I think, if you look at these lines I have drawn upon this sketch, you will see that it is as I say; there would be no place from which members would see the Speaker, except from the immediate front of the gallery?—It may be so.

None of the back row would be able to see the Speaker?—I think a few might, because the piers, although they would be of large dimensions, would still be rounded off; they would not be great square piers. The arrangement, however, would doubtless be far from satisfactory.

Then, supposing you were to do what has been suggested by one of the members, take the intermediate pier away, so as to enlarge the space, that would be tantamount almost to the reconstruction of the House?—I think it would.

Mr. Darby Griffith: In fact, you could hardly interfere seriously with the side walls of the House without its amounting, practically, to a reconstruction?—That is my opinion.

Mr. Hankey: The adoption of some of the plans proposed would involve the necessity of practically rebuilding the House?—Yes; it would involve pulling down the present House and building a new one, and also the provision of a temporary House during the operation.

CONTRACTORS TO THE UNITED STATES GOVERNMENT TREASURY AND POST OFFICE.

FIRE AND BURGLAR PROOF SAFES.

Manufactured with the newly patented "Tongue and Groove" Improvement, "Forged Angle Frame with Sliding Back-plate," "Annealed Hinges," &c. &c. Body of heavy plate iron, secured by angle iron corners and welded refined iron frame and an entire inside iron lining.

Our new patterns give a greater thickness of Fire-proofing than in any other makes. Doors are fitted with round bolts and "Yale" Combination Lock of 1,000,000 changes. Inside doors are of plate-iron secured by suitable bolt work and key lock.

ABSOLUTELY PROOF

Against Blasting, Drilling, and Pick Lock.

Estimates and Designs furnished on application for all sizes and thickness of burglar proof vault doors; also for all styles of vault work.

Every description and style of Fire and burglar proof Safes for Merchants, Bankers, Jewellers, &c. Illustrated Catalogue, with full description, on application.

EUROPEAN BRANCH:

66 QUEEN STREET, CANNON STREET, LONDON, E.C.

"THE PEDESTAL VASE,"

JENNINGS' IMPROVED W.C. APPARATUS

(Combination Urinal and Slop Sink).

Registered No. 16,300.

A PORCELAIN VASE set on a tiled or mosaic floor, within walls or a dado of glazed tiles. The usual wood framing, forming a storehouse for the retention and accumulation of *damp*, *dirt*, and *disease germs*, with the joints, crevices, and imperfections in work which the closet enclosure so often conceals, is entirely abolished. The seat is hinged, permitting free access for use as a *slop sink* or *urinal*, and for cleansing, so that the entire apparatus and space can be freely washed down. For this latter purpose the floor should be slightly sunk, and laid to fall to a grating, with waste carried through the external wall, and terminating in a copper flap valve to prevent draught.

☞ The suggestions as regards wall linings and floor, may, of course, be modified as best adapted to the building in which the closets are used; and in the consideration of such details, alternative schemes will readily present themselves.

At the recent **HEALTH EXHIBITION** (South Kensington, 1884), amongst a series of official tests, under the supervision of Baldwin Latham, Esq., C.E., and the Jury No. 9, Class XXIII., and successfully withstood by this closet, the following may be cited in evidence of its efficient action. Being fixed in position shown in illustration, with **"JENNINGS' PATENT SINGLE FLUSH WASTE-PREVENTING SYPHON CISTERN"** 5 feet over, with 1½ inch down pipe, ten apples (averaging 1¼ inch diameter) and a flat sponge about 4½ inch diameter were thrown into the basin. The water, as well as the whole of the exposed or dry surface, was first blackened with plumber's "smudge," and the sides covered by four pieces of thin sanitary paper, which adhered closely to the soiled surface. The handle of the cistern was then pulled, and the two-gallon flush liberated. After seven seconds (the time occupied by the discharge), a receiver placed under the trap outlet was removed, containing in the blackened water **the ten apples, the sponge, and the four pieces of paper,** no traces of the soil remaining visible upon any part of the apparatus.

GOLD MEDAL AWARDED.

THESE CLOSETS are already in use in Hospitals, Banks, Hotels, Offices, Private Residences, &c., with most satisfactory results, and, fixed in the manner described, in appearance and action leave nothing to be desired. By the novel arrangement of the supply to Basin, as shown in the sectional sketch annexed, the whole surface is well flushed and cleansed, whilst the bottom of Basin and Trap are thoroughly scoured by a concentrated rush of water which insures the **instantaneous removal** of the contents, thus overcoming the inherent defects in the many imitations recently produced of **"JENNINGS' MONKEY-CLOSET"** (the **original form of wash-out watercloset**), which was invented and patented by G. J. in 1852.

W. & R. LEGGOTT,

70 Park Road, Bradford, Yorkshire.

N.B.—Size and height of window no object.

TESTIMONIAL.

BANGOR, N. Wales: September 14, 1885.

Sirs,—I have pleasure in testifying that I have used Leggott's Silent Adjustments for various buildings to high skylights, fanlights, and top parts of windows, and in every case they gave satisfaction.

They are secure in whatever position, whether the window is open or closed, and are quite simple and workable in their action. I prefer them to any other that I have seen or used for the above-mentioned purposes.—I remain, yours obediently, R. DAVIES, Architect.

Messrs. W. & R. LEGGOTT, Bradford.

Mr. HARRY PEARCE, 125 Great Portland Street, London, W., is no longer our Agent. All direct communications shall have our prompt attention. W. & R. L.

NOTICE OF REMOVAL.

BELLMAN'S PATENT GULLY.

This Gully possesses the following advantages:—

Receives and disconnects one Rain-water Pipe and Three Waste Pipes.
Avoids all Splashing. | **Forms Drain for Area or Surface.**
Ventilates the Pipes and Trap. | **Is easy of Access for Clearance.**

The ordinary P or S trap to be used in connection with Gully being in a separate piece, can be placed at any angle to meet the drain exactly, thus insuring a perfect joint, the Gully being fixed at right angles. This is a great advantage over other arrangements made with the trap in one piece.

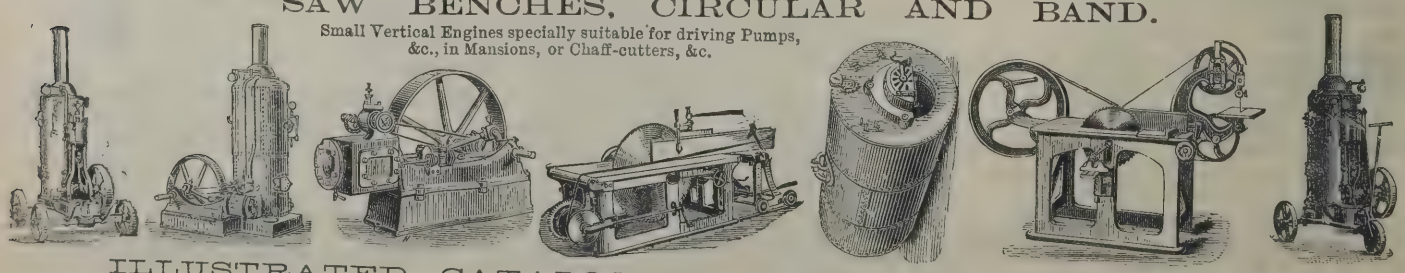
The Holes for Rain-water Pipes are made both Circular and Square and of various sizes.

DESCRIPTIVE CIRCULAR ON APPLICATION.

THIS GULLY IS HIGHLY RECOMMENDED by Authorities on Sanitary Matters.

PRICE AT DEPOT:—EDWARD ST., DORSET SQUARE, N.W., 8s. 6d. each.

Also SINGLE GULLIES, for Sink Wastes only, price 3/9 each.



BELLMAN & IVEY,
(OFFICE ONLY) 37 PICCADILLY, LONDON, W.

E. S. HINDLEY, 11 QUEEN VICTORIA STREET.

TRADE NOTES.

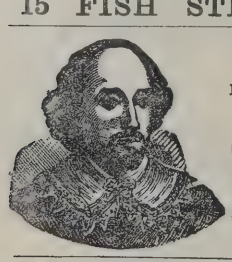
MESSRS. JONES & WILLIS, of Birmingham and London, have just erected in Ogley Hay Church a Caen stone pulpit, and for Filey Church have executed a polished brass eagle lectern.

THE Patent Noiseless Plain and Inlaid Tile Company, 11 King Henry's Walk, Balls Pond Road, N., have received an order to cover the offices of the Royal London Friendly Society, at their new premises, 108 Paul Street, Finsbury Square, with their new tiles, and have recently laid them at the private entrance to the Globe, 105 Great Titchfield Street, Oxford Street, W.

WE are pleased to hear that Mr. Charles D. Phillips, of the Emlyn Engineering Works, Newport, Mon., is about to ship some machinery of various kinds from the Alexandra Docks, Newport, Mon., for Buenos Ayres, this being the third or fourth shipment for this destination which has been sent from the above docks. He has also received some considerable orders, which are now under execution, from New York, and has just completed some shipments, all of machinery, to Helsingfors, Finland, Hong Kong, Cape of Good Hope, Australia, India, Sicily, Lisbon, and Madrid, and is sending some of his harvest fans to Germany.

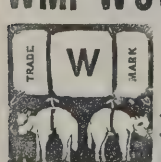
THE Hanley Town Council have accepted the following tenders in connection with the Quarter Sessions Court and approaches, viz.:—Messrs. Geary & Walker, for wood-block flooring, 6*s.* per square yard and 2*d.* per foot run for extra trimming; Messrs. Geary & Walker, for concrete flooring in basement, 2*s.* 3*d.* per square yard; Messrs. Homan & Rodgers, for concrete flooring on ground floor corridors, 6*s.* per square yard; Messrs. Homan & Rodgers, for special quartz finish to iron and concrete corridors, 3*s.* per square yard; Messrs. Homan & Rodgers, for fireproof iron and concrete gallery, 40*l.*; the Campbell Tile Company, for tiled floor in the entrance corridor and hexagon hall, as per design submitted, 60*l.* 10*s.*; Mr. Renton Gibbs, for hot-water heating apparatus, 167*l.*, and for coil case, 10*l.*; Mr. C. Cornes, for conversion of stables into fire engine-house and weights and measures office, 44*l.*; and Mr. Thomas Bickley, for plumbing, painting, and glazing at the new Sessions Court.

THE old-established hotel in Cranbourne Street, known as the Cambrian, has just been rebuilt, and is decorated with a very fine picture in tiles from Messrs. Carter & Co.'s works at Poole. The scene represents an historic incident which took place in Leicester Fields in the latter part of the seventeenth century. "A foul murder had been done," and the occasion was the means of gathering together a motley group of gallants, with the slashed and varied doublets and hose, and picturesque Rembrandt hats and feathers; interspersed with them are one or two sturdy Puritans, together with a miscellaneous crowd of men and boys. The grouping of the whole is most picturesque and harmonious, whilst the action and expression of the figures is lifelike. In striking contrast to this stir and bustle is the bit of "still life," as embodied in the corpse; but this is subdued, and has none of the ghastly realism which generally attaches to the representation of a dead body, and this brings out the merits of the artist, who has dealt with a sensational subject in an unsensational and pleasing manner. The framework is of majolica moulding and flat framing combined. The high excellence which Messrs. Carter have attained in all branches of ceramic and tile decoration is worthy of all praise, and when the durability and cleanliness of this style of art is considered, it will doubtless come into very general use.



MESSRS. GENT & CO., of the Faraday Works, Leicester, have just issued an enlarged and revised price-list of their electric and pneumatic apparatus. The catalogue also contains a quantity of useful information on the construction, fixing, and repairing of electric and pneumatic bells, with details of electric-lighting and telephones, forming quite a valuable little *vade mecum* to a branch of industry which is assuming such large proportions—bells alone worked by electricity include more than a dozen different varieties, and each variety is capable of embracing other modifications. Indicators likewise form quite a collection of themselves. It would be impossible to enumerate all the different electrical furniture manufactured nowadays, or even the electrical machinery in use. We must refer our readers for this to Messrs. Gent & Co.'s list.

NOTES ON NOVELTIES.



Locks and Door Furniture.—Door furniture and locks are made a prominent speciality by Messrs. Edgar Keeling, Teale & Co., ironmongers and manufacturers, art metal workers, &c., 14 Elm Street, Gray's Inn Road. We have pleasure in drawing the attention of our readers to the locks and door furniture made by this firm. They seem to us to supply a very universal want in the way of good useful articles of best finish and workmanship at a very moderate cost. The most inexpen-

sive and the plainest articles are handsome and ornamental in themselves, as is every plain object turned out by good workmen as distinguished from wares which are supposed to be "cheap," but are decidedly "nasty." In what is technically called ornamental work the same judicious management is apparent. Attention might be called to the well-finished mortice locks made by the firm, of different varieties, the mechanism of which are all of a character to secure freedom from the drawbacks of ordinary locks. New designs in ornamental rim locks are also deserving of attention. Finger plates in oak and ebony or porcelain are noticeable for a quiet gracefulness which render them suitable for the highest class requirements. The door knobs and spindles, window hoops, &c., are in keeping with the rest of the specialities made by this firm.

Osmond Safety Door Bolt.—We have had forwarded to us for inspection the "Osmond Safety Door Bolt," the patent of Mr. Osmond, of Thornhill Works, Lee, London. It seems to us a decided improvement on the ordinary door-chain. A steel bolt slides into a guide fixed to the door and a catch is fixed to the door jamb into which the bolt also slides. The door is thus securely fastened or opened for ventilation by the easiest of movements, and is perfectly secure. When the door is closed it is impossible to remove the screws, they being within the bolt. A much stronger hold of the door is obtained than by the ordinary chain, besides being perfectly noiseless, and giving a much better appearance. It does not cut the door as does the chain, it is impossible to move the screws, and as it is so simple in construction, the "Safety Door Bolt" when once fitted is not likely to get out of order. It should meet with approval amongst architects.

ENGLISH PORTLAND CEMENT IN AMERICA.

The English Consul at San Francisco reports that Portland cement is one of the few articles from England whose importation has steadily increased during the last ten years in his district. Previous to that the annual importations did not exceed 15,000 barrels, while it now amounts to 120,000 to 150,000 barrels annually. The duty on this is 20 per cent. of its original cost, yet English Portland cement has almost driven American cement out of the market. In former years large quantities of Rosendale cement, manufactured in the Eastern States, were used, but its importation has almost ceased. To keep this large trade low freights from England are necessary, so as to be able to place the cement in this market at a price not higher than 12*s.* (3 dols.) per barrel of 100 lbs.

MAINTENANCE OF ROADS.

At the Gloucestershire Quarter Sessions, which were held last week, Major Salmon, one of the magistrates, referred to the recent road conference, and said he had received a report by the surveyor of the Northamptonshire main roads, which stated :—"I am of opinion that by a more skilful and judicious management of labour and material, the roads which are defective might have been in a better condition than they are ; in all cases without any addition to the cost of maintenance, and in some with an actual reduction in that cost. The material, be it granite or slag, must be broken on Macadam's principle, *i.e.*, to as near as possible inch and a half cubes, or so that the largest stone in a heap should pass through a 2-inch ring in any direction. The neglect of this principle is the main cause of the badness and costliness of the defective roads. Stones thus broken fit much tighter together, work in much quicker, make a much smoother road, and wear much better, and, moreover, will cover a much larger surface than if broken to a larger size. No mud or other binding material must be used, but the stones must unite by their own angles into a solid mass, except that sometimes it is desirable to add a little fine stuff of the same material as that used for repairs, to help to work in some material which would otherwise get loose and scattered. The traffic will generally provide more than sufficient mud and dust to fill up the very small interstices which will be left when the stones have been properly bound together. The stones should be laid on the road only where wanted, and not in too long lengths. The evenness of the road is then easily maintained, and the tendency for traffic to track is prevented. And it is a mistake to lay them down more than one thick, for the result of so doing is that they get ground against each other into mud, instead of working in, thereby occasioning waste of material and an uneven road. The stones should be laid down during November, or not later than Christmas, so as to get settled down before frosts or drying winds come to prevent them working down to an even surface. This of course necessitates the early storage of broken material."

SECTION.

PLAN.

The Chairman said it came out very clearly at the conference that the Clee Hill stone, which cost 13*s.*, 14*s.*, or 15*s.* a yard, was very much cheaper than the inferior oolite stone, which cost only 3*s.* 6*d.* a yard when put on the road, as it was so much more permanent. He much desired the main roads of the county to be laid with the more expensive but really more economical stone than the inferior local stone which was so generally used, as he was sure a great saving of expenditure would thereby result.

Mr. Smith referred to the importance of the information given in the papers read at the conference being widely circulated. In his district some of the roads were mended with pieces of jagged flint and sea sand, which rendered the road very dangerous.

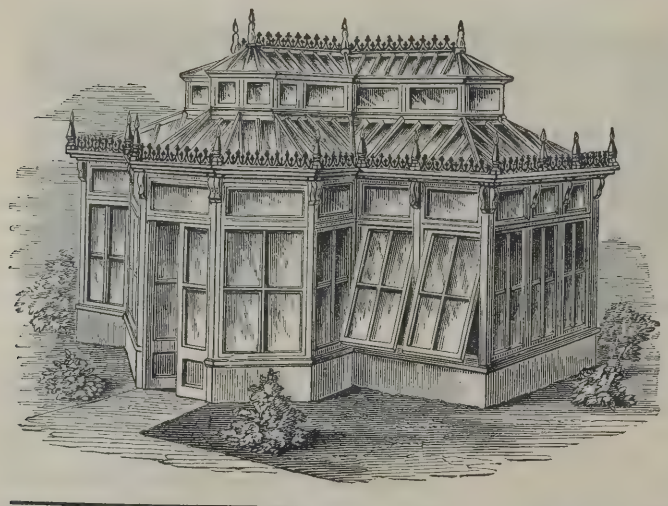
The Chairman said much valuable information was given at the recent conference. Two contributions had been offered towards the cost of publishing the papers read, namely, by the Cyclists' Club and the Clee Hill Stone Company.

After further discussion it was agreed that, with the aid of the contributions mentioned, copies of the papers read be printed and circulated.

BRITISH TRADE WITH FRANCE.

AT the present time it is the duty of every one to do their utmost towards extending British trade. When it is found that our German rivals are selling goods at prices which at first sight seem less than the cost of production, nothing should be left untried to bring English work into competition with them. There is much in the English mercantile system of foreign trade which demands revision. Take the case of France, for example. It is assumed that English goods must be as well known in every part of the country as in Scotland or Ireland, and that it is not requisite to make any difference in the mode of disposing of them. But there is scarcely a report from one English Consul in France which does not testify to the absence of something which if present must lead to an increase of business. Thus, for example, in the report from Corsica, which was written on April 26 last, Consul Graves says :—

I notice that many important articles are imported from Germany and other countries which can be obtained cheaper and better from England, but most English manufacturers object to offer their goods otherwise than on English standards of weight, measure, and value, for delivery at their works, or at most free on board at a British port, while Germany and Holland offer their manufactures on French standards delivered free to Marseilles or even to this port (Bastia). The advantages of this latter system to the buyer are manifest, while the seller who really desires to do a foreign trade should find no difficulty in complying with this need, without which few buyers will give any attention to his offers, however advantageous they may really be.



The complaint about non-compliance with foreign requirements is not new, and is heard throughout the world. Even more explicit is the report from Vice-Consul Warburton at La Rochelle. He writes :—

La Rochelle is a small district, and one which does not take a large amount of British produce, *but I have no doubt that here, as well as elsewhere, that amount might be greatly increased if proper steps were taken to do so.* Almost all business is done through commercial travellers, who come round monthly (or in some cases quarterly) looking for orders. These agents are sent by the manufacturers and wholesale houses to sell their own goods, and their success depends in a great measure on their smartness and activity in the face of much competition.

Local tradesmen buy principally through them; many do so entirely, seldom leaving their place of business, but expecting what they require to be brought to their doors, and not always getting the best or most advantageous goods, but those which are most pressed upon their notice provided they are saleable.

The principal British products in demand here are coals, pitch, cement, and iron. These are imported direct from the producer, or through agents, who only receive a very moderate commission. The freights are as low as possible, and there is not much room for improvement in the conditions under which they are imported and distributed. But there are a number of other English articles which only reach the consumer here in a roundabout way, passing through many hands before doing so, and finally reaching him at an enormously increased cost for want of a more direct and efficient system of agency. Generally speaking, cheapness comes first in this country, and then quality; and if these qualifications are fairly well attended to, British manufacturers should do a much greater business than they do now under present tariffs.

The principal bugbear that deters English traders is the French tariff. It would be better perhaps if Mr. Ruskin's wish could be carried out, and all custom-houses be demolished, but

we are not likely to see that accomplished prior to the millennium, when custom-house officers and soldiers will both take to pastoral pursuits. Meanwhile, it may be asked whether the tariff is as bad as it has been represented. In respect to many classes of goods it is not oppressive, and there are manufacturers who find that, in spite of it, they can do a good trade with France. But some think it to be their interest to make the worst of the custom-house regulations, and in this way contrive to frighten their competitors. English goods stand well with the French, and there is no reason why they should not have as extensive a sale as those which are produced in Germany.

DECORATORS' PLANS.

THE case of Nosotti *v.* Saunders, which was tried on Friday in the Queen's Bench Division, suggests what is the law in respect of expenses incurred in the preparation of estimates. The plaintiff, who is known as a decorator having premises in Oxford Street, was asked by the defendant, proprietor of the Assembly Rooms at Margate, to tender for the decoration of the rooms, and Mr. Nosotti, in order to enable him to do so, sent down men to make measurements and plans on which he might base his estimates, and in so doing he incurred an expense of 27*l.*, for which, as the matter went off, he sued the defendant. The case was tried in the Mayor's Court before the Recorder, and the plaintiff called witnesses to prove that the charge was customary; but more than one of them stated that, though he should have made such a charge, he should have told his employer so, and it did not appear that Mr. Nosotti had told the defendant he should make the charge. The jury, however, found for Mr. Nosotti.

Counsel for the defendant moved to set aside the verdict on the ground that there was no evidence of any contract to pay for the expenses of the tender.

On the part of the plaintiff, it was urged that there was sufficient evidence to raise an implied contract to pay.

The Court, however, said that an implied contract would not arise in such a case, and it was necessary to show an express contract to pay for such expenses. And as to the evidence of custom, it was not sufficient to raise an implied contract unless shown to be so well known that it must have been known to the defendant. The verdict, therefore, must be set aside.

WAGES IN NEW YORK.

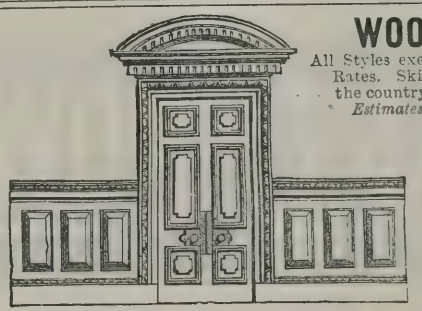
THE SOUTHAMPTON WATERWORKS.



THE memorial-stone of the buildings connected with the new waterworks of the Southampton Corporation has lately been laid by the mayor. The site is near the Shawford railway-station. The works are being carried out by Mr. W. H. Simonds, of Reading, under the direction of Mr. W. Mathews, C.E. After the stone had been laid, the engineer, at the request of the mayor, described the undertaking. Mr. Mathews said that works for water for Southampton were originated about the year 1290. It was 600 years since waterworks were introduced into Southampton, and 466 years ago since the Corporation first acquired them. Previous to that the matter, like other things of the period, was in the hands of the clergy, and it was not until 1420 that the water came into the hands of the Corporation, and since then a great many things had been done in the

Handsomely bound in Cloth, Gilt Lettered. Price 12s. 6d.—Office : 175 Strand, London, W.C.

way of getting a supply of water for the houses from springs and conduits in the town. Eventually the waterworks were established at Mansbridge. They had heard and seen so much of the new works that he thought he might go at once to the place where they were then assembled. The building, the memorial-stone of which they had just seen laid, would be 250 feet long by about 40 feet in width. There would be the engine-house, the boiler-house, tool-house, filter-house, and the lime-house. The building would be red brick, with a certain amount of Portland stonework, a little ornamentation being introduced. The engines would be on the compound principle, beam engines, working up to 120 and 150 horse-power, and each capable of pumping two million gallons of water per day, so that they would see the engines would be ample to keep the town supplied with water. The next would be the boiler-house, where they would have three steel boilers, with room for a fourth. The next building would be used as a tool-house, &c., so that in the case of a breakdown of any part of the machinery it could be repaired without sending things away. The next building, and one which was of importance, was the filtering-house, where there would be a number of filters to purify, or rather clarify, the water before it would be softened by the softening process. The next building would contain the softening materials—the lime-house, with the lime for softening. When the water was pumped from the well below it was very hard, but by mixing it with the lime it became very much softer. In order to get rid of its milky appearance a large amount of deposit had to be got rid of. Under the old system they had large tanks—such as they had at Mottisfont—into which the water was run and the deposit allowed to subside. Of course, if that were done in this instance it would be a big thing. They would be obliged to have tanks which would hold three million gallons of water, which would be a very expensive matter indeed. Instead of that, after being pumped up the milky water would pass through a series of revolving filters, then through some perforated zinc, and eventually through cotton cloth, leaving the deposit on the outside. They would then have discs or revolving sprays of water, which would fall on the cloth, and disperse the deposit, the latter falling to the bottom without any trouble whatever. This would not take two men all their time, and he was in very great hope that one man would be able to manage the whole thing. The well was nearly completed. They had two deep borings, 6 feet in diameter. One would have been completed but for an accident to the tool the night before. These borings would go down something like 100 feet into the chalk, and they were the largest borings ever sunk anywhere. With regard to the money to be laid out, there was no doubt it was great, and the bulk of the money would be spent on the spot where they then stood. Of the 50,000*l.* or 60,000*l.* required, nearly 40,000*l.* would be sunk there.

THE EDINBURGH INTERNATIONAL EXHIBITION.

IT has been a matter of surprise with those who interest themselves in exhibitions that the Scottish metropolis has so long refrained from following the example set by the other chief cities of the kingdom, the colonies, and foreign countries generally, in the direction of national and international displays of arts and manufactures. But if she has been long in making up her mind, Edinburgh has every reason to be proud of the collection that the executive body charged with the carrying out of the arrangements have drawn together in the temporary building in the "Meadows." It appears at first thought a somewhat doubtful experiment to "run" four important exhibitions in one country simultaneously, but it is certainly one that will enable us to judge if there is any reason to suppose that the parrot cry so constantly heard that exhibitions are overdone has any foundation in fact. So far experience points in an opposite direction, and it may have been supposed that the Edinburgh display being so far north would have materially differed from the counter attractions of London, Liverpool, and Folkestone, each of which can lay claim to valid reasons as to why they are likely to receive a large amount of public patronage. But Edinburgh has no reason to complain, and we understand that the exchequer is in that satisfactory condition that all fear of having to make a call upon the guarantors has long since ceased to trouble the executive, and at the present time the numbers who have passed the turnstiles approach the first million very closely. Be it remembered, too, that this is before Scotland's tourist season has thoroughly set it, so with the prospect of the usual influx of visitors, coupled with the promised visit of Her Majesty and other members of the Royal Family later on, the record of Scotland's first international exhibition is likely to be one of a most satisfactory character.

The exhibition is divided into sixteen classes, one of them, No. 14, being devoted to fine art. No. 16 is devoted to women's industries, those of Scotland and Ireland being principally illustrated, while the others cover almost every other kind of manufacture and industry; class 1, comprising minerals, mining,

BRYANT, POWIS & BRYANT
LIMITED,

quarrying, and metallurgy, forming a very interesting section. Exclusive of the sixteen classes, there is an artisans' section, which should be spoken of with every mark of respect. It forms a by no means incontemptible exhibition in point of numbers, there being no less than 440 exhibits, Scottish workmen contributing 375 of the total, the rest hailing from Sheffield, and being composed chiefly of cutlery and edge-tools. Of the former it may be said that they cover a very wide range, and amongst other things embrace many models of steam-engines, beautifully made, to a new differential steam-engine of two-horse power at work amongst the machinery in motion.

Amongst the manufactured exhibits that of Mr. Robert Adams, Blackman Street, Borough, S.E., is, as usual, of much interest, and embraces the many specialities connected with window and door work for which he has become so noted. Prominent amongst them is his patent safety window, enabling the vertical sashes to be instantly changed to swinging ones for cleaning. The many fanlight-openers he has introduced are all to be seen on the stand and their action illustrated. The door stay and weather-tight sill-bar is an admirable invention for preventing rain or wind from entering a room from the bottom of a window, and of somewhat similar character is the tongue bolt for casements, extending the whole length of the frame, and being shot into a groove in the opposite frame, forming a sound barrier to the inroads of "wind or weather." The "Victor" silent spring hinges necessarily form an important part of Mr. Adams's exhibit, which also embraces his burglar-proof sash gear, the three-through bolt for French casements, &c.

Messrs. Hobbs, Hart & Co., Cheapside, have an imposing display of their specialities, the collection of locks in particular being fine specimens of workmanship. In this department specimens are shown of those manufactured for prisons and convicts' departments. The collection of safes, strong doors, &c., are of the usual character made by the firm.

Messrs. Robert Boyle & Son, Holborn Viaduct and Glasgow, are present with examples of their several ventilating appliances, though their exhibit is by no means so extensive as we are accustomed to see in London. However, it is quite sufficient to illustrate the *modus operandi* of the different articles made by this popular and enterprising firm. As we have so often drawn attention to Messrs. Boyle's inventions further description is rendered unnecessary. We may, however, remind our readers that the special name given by Messrs. Boyle to their leading ventilator is that of the "Air-Pump Ventilator."

Messrs. Nightingale & Co., Great Grimsby, exhibit to advantage their patent system of wood-block flooring, which was described by us in detail in our report of the Exhibition of the Sanitary Institute of Great Britain, at Leicester, in September and October last. The firm submit a list of the principal places in which their flooring has been laid, which includes a large number of notable buildings in various parts of the kingdom.

Messrs. J. & M. Craig, of Kilmarnock, have a large display of their varied productions in sanitary pottery, fireclay goods, &c. The exhibit comprises a large number of individual articles, and also includes amongst builders' goods tinted enamelled bricks for string courses, dados, &c. There are also balusters of fireclay, and a variety of garden vases and rustic work, all of which are salt-glazed. Messrs. Craig's productions in point of quality are so generally acknowledged that we need not further revert to them.

Messrs. Shanks & Co., of the Tubal Works, Barrhead, near Glasgow, and Cannon Street, E.C., well maintain their reputation as makers of sanitary appliances. One of the leading items in the exhibit is their "Eureka" combination bath, in which the number of taps is reduced. They have also a compact Turkish or vapour bath, in polished walnut, for home use, and an "Independent" plunge and spray bath, without woodwork. Sanitary lavatories are shown in white porcelain for dwelling-houses, and white enamelled fireclay for schools. The exhibit also comprises a general assortment of the goods manufactured by the firm, including wash-out and other closets, water waste-preventers, fold-up lavatories, sanitary appliances for ships, &c.

Messrs. H. J. & C. Major, Bridgwater, have sent a small collection of their patent waterproof and self-fixing roofing tiles, which have been fully described by us on former occasions.

Messrs. Geary & Walker, 24 Charing Cross, S.W., and John Dalton Street, Manchester, exhibit their patent Premier system of wood-block flooring, which has been already described in these columns, the notable feature in the invention being that it is not only laid on a solid concrete foundation, rendering it practically fireproof, but the blocks are dessicated and bedded into a specially prepared mastic, but are afterwards secured to the sub-structure by metal keys dovetailed into the blocks.

Messrs. Williams & Co., Lillie Bridge Works, West Brompton, S.W., have a similar exhibit to that shown at the last

PRESS OPINIONS.

Messrs. SANDERSON & SONS have been awarded for their Wall Decorations the only Gold Medal at the New Orleans International Exhibition. This Medal may be considered the highest ever awarded to a paper stainer, as it was not obtained, as usual, in competition with other English firms only, but with the whole world—English, French, German, and American firms being all in one class.

Warehouse
52 BERNERS ST. W. LONDON. Manufactory
PAPER-STAINING WORKS
CHISWICK.

Building Exhibition at the Agricultural Hall, comprising their improved metal casements, of which we gave our opinion at the time. The favourable comments we then made have since been strengthened, and the exhibit is attracting as much attention in Edinburgh as it did in London.

Messrs. Le Grand & Sutcliff, Bunhill Row, E.C., are represented by the well-known and highly useful appliances, the Abyssinian tube wells and pumps, and registering turnstiles (Norton's patents). They also exhibit specimens of dwarf piles for foundations of telegraph and railway signals or other poles, that will be found very useful for such purposes. The "Ramrod" lawn-tennis poles, recently patented, will, we doubt not, be much appreciated by those charged with the forming of the courts, and they are substantially-made articles, likely to last an indefinite period.

In decorative articles, Messrs. Rottmann, Strome & Co., St. Mary Axe, E.C., send specimens of their Japanese embossed leather hangings for walls, of elaborate designs. These hangings are washable, non-poisonous, and damp-proof. A very fine Japanese cabinet is also shown, a fringed carving around the edges of the different sectional openings being a finely-treated piece of work. The exhibit is supplemented by a superb pair of large vases, as well as some small pottery of choice design.

Messrs. Jeffrey & Co., Essex Road, N., have a commendable exhibit of their non-arsenical wall-papers, both hand and machine-made, some of the tools used in the manufacture being also shown. The exhibit comprises five sections, devoted to—No. 1, flocks; No. 2, embossed leathers and leather papers; Nos. 3 and 4, hand-printed papers; and No. 5, machine-printed. The designs are numerous, and many of them from the pencils of well-known artists. Amongst the hand-printed, Mr. Lewis F. Day is credited with No. 21, a decoration with a dado of lilies and crown imperials, a choice *morceaux*; and an embossed leather, No. 11, by Mr. Walter Crane, "The Golden Age," is well worth notice. Mr. J. D. Sedding's name appears against No. 12 in this section, a rich hanging, the colours ranging from subdued greens to a kind of gold-green, if such a term is permissible. Other artists who have contributed to this display are Miss K. Faulkner, Messrs. W. S. Morton, G. E. Fox, T. W. Sharp, B. J. Talbert, A. F. Brophy, and B. Binyon.

Mr. J. Leslie Jamieson, of the Crown Granite Works, Aberdeen, well represents the speciality of the "Granite City," as it is often called, by the specimens of granite vases exhibited by him in the grounds of the exhibition. Mr. Jamieson is a manufacturer of granite specialities of long standing, and can supply the native stone in any form required. The vases shown here are worthy of high commendation, and we should like to see them introduced fully into the London market, where we are convinced they would be appreciated.

Messrs. Frederick Walton & Co., Limited, Sunbury-on-Thames, make an interesting display of the popular "Lincrusta Walton" wall decoration, which has been so often mentioned in these pages. The specimens shown on the present occasion well maintain the reputation of the firm, and are attracting considerable attention amongst the better-class visitors to the exhibition.

Messrs. William Woollams & Co., High Street, Manchester Square, W., are located next to the last-named firm, and their exhibit loses nothing by comparison. The first to introduce non-arsenical paper-hangings, Messrs. Woollams & Co. have always made the innocuous character of their productions an especial study, and have unmistakably shown how unnecessary it is to allow poisonous pigments to enter into the composition of wall-hangings. The exhibit embraces the entire range of papers of which they make a speciality, as well as samples of their patent tergorine, a substitute for leather, of which we have given a description on a former occasion. Amongst the patterns that drew our attention we may mention "The Netherlands," an Italian damask of rather large pattern, from an old example, the name of the designer being unknown. The colours here are yellow, drab, and white. "Savoy" is a dado decoration from the pencil of Mr. A. F. Brophy, and is coloured in neutral blues and white and gold, and, as a lady remarked in our hearing, "is sweetly pretty." Another decoration called the "Lyrebird," by Mr. Owen W. Davis, must not be overlooked. It is a complete hanging, including frieze and dado, a pale terra-cotta red being the principal colour in the body, turquoise blue, white, and gold figuring in dado and frieze. We miss the name of Miss Aumonier on this occasion from the list of designers, which also comprises Messrs. C. F. A. Voysey, A. V. Tatham, F. J. Weidemann, F. Darling, J. Wildey, T. W. Hay, Allan Ramsay, J. West, and H. Noble.

Messrs. Campbell, Smith & Campbell, Newman Street, Oxford Street, W., have an attractive and meritorious display of stained-glass panels for domestic use. The subjects are varied, but all are well executed, many of them showing great delicacy of treatment and purity of colour.

MANUFACTURERS OF PATENT
METAL CASEMENTS
AND
LEADED WINDOWS.
Our Patent Steel "SIMPLEX" Casements have the following advantages over any other Casements in the market:—
They are thoroughly weathertight.
They can be made to open inwards or outwards, hung at the sides, or head, or sill, and in all cases the PLANE OF GLASS and the SIGHT LINE are the same.
They will not SAG, or TWIST, or JAM.
The Glass being secured by metal fillets the ragged appearance of putty is avoided.
The face being moulded has a more pleasing appearance than the ordinary uncouth finish.
By the use of these Casements all difficulties of window-cleaning are overcome.
The Patent "Cottage" Casement is made for such positions where plane of glass and thorough weathertightness are not absolute requisites, and where the extent of finish is not necessary.
Prices and particulars will be gladly furnished on receipt of inquiry.

DRY WAINSCOT OAK, in every thickness, several thousand Logs, from 8d. per foot.
Dry Wainscot Floor Boards, ¾-inch, 65s.; 1-inch, 75s.; 1¼-inch 95s. per square.
Dry Mahogany, Teak, and Birch.
Dry Black Walnut, 8d. and 9d. per foot.
T. FORMAN, Walnut Tree Walk, Kennington Road, S.E.

have an assortment of their noted wet and dry gas-meters and governors on show; also a clock lamp-pillar for ascertaining the consumption of gas without meter. Messrs. Peebles's gas consumer governor stands highest, according to the tests of the jurors of the Glasgow Gas Exhibition, in the list of dry governors, and is one of the lowest in the range of variation. The gas burners made by this firm have a high reputation. They are named the Automatic Needle Governor Burner, maintain a uniform consumption under varying pressures, and, according to tests made with them by Mr. T. Fairley, F.R.S.E., public analyst and gas examiner for the borough of Leeds, the saving in consumption of gas by their use as against the ordinary burners is from 20 to 40 per cent.

The Blackman Air Propeller Ventilating Company, Limited, Fore Street, E., exhibit their powerful fans for the moving of large bodies of air in whatever way required. By fixing in one direction the blades act as extractors, and in the case of manufactories, where much dust arises, the workshops can be kept perfectly clear, and the health of the workers free from injury, and by reversing the mode of attachment the blades are changed to inlet ventilators and draw in a large volume of fresh air every minute. The Blackman air propeller is made in various sizes, and to work by power or hand force.

Messrs. Wm. Sugg & Co., Limited, Vincent Works, contribute some excellent scientific instruments connected with the gas industry, including Sugg's improved "Letheby" bar photometer, and the required apparatus for testing, for illuminating power, &c., and their improved "Lowe's" jet photometer. There is, in addition, Sugg's patent illuminating power meter, and an attractive collection of the new patent "Cromartie" gas-lights, of which we have spoken heretofore. This light is certainly the prettiest in effect of any gas-light before the public, and the consumption of gas is said to be very small. The remainder of the exhibit is composed of a variety of painted and coloured glass globes, shades, &c., of high-class workmanship, and a full "line" of the firm's patent gas-burners in argands, patent table top steatite, &c.

Messrs. Doulton & Co., of Lambeth, appear in Class 2 with a small but choice collection of their popular art ware, including Doulton, faïence, impasto, pâte sur pâte, silicon, &c., and again in Class 9, the exhibit being composed of a general assortment of pottery ware for domestic and manufacturing purposes, including specimens of their glazed terra-cotta fireplaces and mantelpieces, open and close stoves, hearths, kerbs, &c., sanitary ware of all kinds, and apparatus used by distillers, chemical manufacturers, dentists, assayers, &c. Messrs. Doulton also appear in the complimentary list as having rendered the executive good "suit and service," in so far that they have provided the complete fittings for three retiring-rooms (two gentlemen's and one ladies') with their newest and most approved closets, lavatories, &c., and two sets of urinals in the grounds. They have also provided a number of the fittings for an artisans' model dwelling, one of a set erected in the grounds by the Lord Dean of Guild Gowan, amongst which we may mention a glazed terra-cotta fireplace, which it is expected can be manufactured in quantities at a price that would enable them to be used for such erections.

Messrs. Shanks & Co., Tubal Works, Barrhead, Glasgow, have also, in addition to their trade exhibit, assisted the executive in a similar manner to the Messrs. Doulton, by providing the fittings for a ladies' private retiring-room, and two public retiring-rooms.

Many other firms have generously come forth in a similar manner, amongst whom we may mention Messrs. Walter Macfarlane & Co., who have supplied a quantity of ornamental garden seats for the use of visitors, also the ornamental iron pipes and guttering for the tenement houses before alluded to. We are sorry, however, to find that Messrs. Macfarlane are not exhibitors in their trade section.

In the same category we find Messrs. Robey & Co., of Lincoln, who contribute several splendid engines and boilers, part of which are used for generating the electric light used in the exhibition.

Messrs. Tangye's (Limited), Cornwall Works, Birmingham, have also materially assisted the committee by supplying some of their powerful machinery, in the shape of hydraulic and other lifting-jacks, chain-guides, Weston's differential pulley-blocks, &c.

One other attraction in this excellent exhibition has yet to be mentioned, and that is "Old Edinburgh," erected and carried out upon similar lines to "Old London" at South Kensington. Amongst the buildings reproduced are facsimiles of several of considerable historic interest to the Edinburgh folk as well as to the general visitor, and include the Luckenbooths, Westport, Lawnmarket, West Bow, &c., all of the fourteenth, fifteenth, and sixteenth centuries. The houses are filled with artificers at work, and stalls or shops for the sale of a variety of articles. Sixteenth-century costume is worn by all engaged in them, and we have only one fault to find, viz., that too much of the bazaar element has been allowed to find its way into the building.

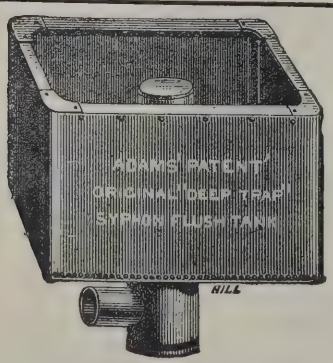
ESTABLISHED 1844.



BRADSHAW'S LIMMER ASPHALTE

Messrs. BRADSHAW & CO., being Sole Agents in the United Kingdom for, and possessing proprietary rights in, the Freehold Mines of the German Asphalte Company (of which Mr. C. W. Bradshaw is also a Director), situated at Limmer, near Hanover, and Vorwohle, Brunswick, possess special facilities for reliable and prompt delivery of their celebrated "LIMMER ASPHALTE" at low rates, either for sale in its natural state or ready for laying by their own workmen in any part of the United Kingdom. EACH BLOCK supplied from these Mines, besides bearing the impress of the Company, is stamped with the words "BRADSHAW & CO." The attention of Architects, Engineers, &c., is particularly called to the fact that the "LIMMER ASPHALTE" is especially suitable for use in the construction of Reservoirs, Roofs, &c., where water-tightness is extremely essential. For such purposes **Over 2,000,000 (Two Millions) of Square Feet of "Limmer Asphalte"** have been executed by Messrs. BRADSHAW & CO.; while for Paving purposes **Over 50 Miles of "Limmer Asphalte" Footways** have been laid by them in the LONDON DISTRICT ALONE. Messrs. BRADSHAW & CO. will be happy to forward Prices, Samples, and Testimonials, and give all information on application to:—

R. ADAMS,

17 BLACKMAN STREET & 7 GREAT DOVER STREET, LONDON, S.E.,

INVENTOR and PATENTEE of the

SAFETY WINDOW WITH REVERSIBLE SASHES

FOR INEXPENSIVE AND PERPETUAL CLEANLINESS,

Which has gained at the INTERNATIONAL HEALTH and SANITARY EXHIBITIONS

Two Gold, Four Silver, and Four Bronze Medals, and Sixteen Diplomas of Merit.

IMPORTANT NOTICE.

The Patentee has been advised by several of his friends to form a Company for the Manufacture of the above-mentioned Sashes in larger numbers, for the supply of the Trade and for the Home, Colonial, and Foreign Markets. Hitherto he has only supplied the Fittings, except under very special circumstances. He now proposes to manufacture the Sashes complete with Fittings.

Provisional Protection has just been granted for another Patent, whereby the Sashes will be greatly reduced in price, and, consequently, brought within the requirements of every Architect and Builder.

If any of the readers of this journal wish to receive further particulars or to take Shares in the proposed Company, they are requested to make early application to the Patentee, as it is expected that the larger number of the Shares will be privately subscribed.

Applications for Shares will be taken in the order in which they are received.

ACTON.

For Pumps at the Outfall Works, for the Acton Local Board.

Hathorn, Davey & Co.	£3,850 0 0
Worthington & Sons	3,650 0 0

Samples of either Stone and full particulars on application.
THOMAS FREE & SONS,
Naphill, High Wycombe.

GRUNDY'S PATENT
WARM-AIR
VENTILATING FIRE GRATE.
The novelty, superiority, and advantage of this paten consist in the heating surface being greater than any other Fire-grate introduced to the public. It is very simple in construction, and is made in the form of a Stove, the back of which is semicircular in shape, with gills behind and smoke-nozzle on top, all cast in one piece. The same can be attached to any design of a Register or Stove front. It is very suitable for schools, class-rooms, waiting-rooms, hospitals, offices, dormitories, and dwelling-houses, from the cottage to the mansion. Design and specification post free on application.
TESTIMONIALS.
"9 Victoria Chambers, Westminster, S.W.: June 10, 1884.
"SIR,—I have much pleasure in testifying to the efficiency of your patent warm-air fire grate. It has been very successful, and given every satisfaction where I have used it. Yours, &c.,
"To Mr. Grundy. JAMES WEIR, F.R.I.B.A."
"6 John Street, Bedford Row, W.C.:
"December 16, 1885.
"DEAR SIR,—I have now had an opportunity of testing your patent grate, and am glad to be able to say that I am most agreeably disappointed, because, as you are aware, I was rather sceptical about its powers when you showed it to me; but now I can say it answers admirably, and heats abundantly my porch-conservatory.—I am, yours truly,
"R. S. LANDER, F.R.I.B.A.
"To Mr. John Grundy."
From James Garry, Esq., Architect, West Hartlepool, July 1884.
'DEAR SIR,—I have very great pleasure in stating that the first stove, or patent warm-air ventilating fire grate, adopted by me in school at Seaton, and a second in a Cocoa Palace, have given such satisfaction that I now order eleven to be inserted in New Upper Grade Schools in course of erection at West Hartlepool. They are the most economical, efficient, and easily managed stove at present before the public.—Mr. John Grundy."
From Hon. and Rev. G. G. C. Talbot, M.A., Withington, Cheltenham.
"DEAR SIR,—You will be gratified to hear that the school is completely warmed by your new grate. It is the most economical and efficient that I have ever seen.—Mr. John Grundy."
Society of Architects, Architectural and Building Trades Exhibition, 1885:—"5 Great James Street, Bedford Row, May 1.—The warm-air ventilating grate shown by Mr. John Grundy at Stand 75 Floral Hall, is an admirable contrivance for utilising the heat conducted through the back and sides of the stove, for warming schools and buildings by a supply of freshly warmed external air."
Apply to JOHN GRUNDY, 30 Duncan Terrace, City Road, London.—Works: TYLDESLEY, near Manchester.
Agent for Scotland, SEPTIMUS HARPUR SMITH, 1 Upper Gilmore Place, Edinburgh.
